SOCIETY AND THE INDIVIDUAL.

BY WILLIAM J. POTTER.

If the fundamental question of the relation of individual existence and of individual welfare to the aggregate power and well-being of society could be settled, with it some of the foremost problems of the day in social, political and ethical philosophy would find their solution. This fundamental question is behind the struggle that is going on between labor and capital. It is involved in the various theories of socialism, communism, anarchism, which are now claiming public attention. In political science, it is behind the problem whether government shall be protective, educational, paternal, or merely representative of such conditions and needs as are strictly common to all individual citizens. And in ethics the most perplexing problems are concerned, not with the relation of one individual to another, but with the relation between a single individual on one side and the whole aggregate of individuals, as represented by public opinion, custom, law, on the other side. Are there, then, any general principles bearing upon this central question of the relation of the individual to society which will help toward a solution of these specific problems?

It seems to me that there are such principles. And one of the first among them is that nature in this matter should be our teacher; not material nature merely, but nature in its broad meaning as including man as well as the physical universe—nature as covering the whole of that spinal world-plan by which, as science assures us, from the amorphous, chaotic mass of primitive matter, with whatever forces were inherent in it, there came successively all the various orders of being known to earth, on an ascending scale of organic capacity and function, until man was reached, with his commanding intellect, his moral sense, his creative purpose and will to be guided by reason and right.

And how has nature, or the power within or behind nature, wrought in this world-process? Not to go into details, it has worked by the method of differentiation; that is, by successive separations of the amorphous mass of primitive matter and the gradual production of specific and individual forms of existence, each still in some way dependent upon or related to the parent mass and its forces, but taking on organic vitality, functions and

power of its own. As this process of concentrating the forces of existence and life in specific forms has continued, the organism has become more complex and capable, its functions more various and effective, its power both more extensive and more exquisite. To make strong species and individuals as instrumentalities for continuing its energy and developing its life, appears to be nature's aim. And this is done through the instinct of self-preservation; or the natural impulse of every organic existence to maintain and hold its existence against all opposition. From this instinct have come the labor and struggle for food, the storing of food for future use, the efforts to defend life and strengthen its powers of resistance to disaster, the desire and acquisition of property, and the strife for property beyond any immediate need as representing enlarged means of living. Some of the developed phases of the instinct of self-preservation are common to all orders of animal life and some of them are peculiar to the human race. In short, it may be said that nature produces strong, capable, masterful individuals and races through the principal of *selfism*; or of each being put under necessity to care for its own existence, to maintain its own rights, to provide for its own sustenance and prosperity. Thus faculty is trained and skill and power acquired.

But this concentration of energy in individual faculty and power is clearly not nature's highest nor final achievement. This is means, not an end. So far, at least, as concerns the forms of life below man, it does not appear that the individual organism exists for its own sake, but for the sake of the species to which it belongs; and the species again, it may be, for the sake of some larger realm of life. Nature insists, by the necessary conditions of existence, that the individual shall make itself as strong and bring itself as near to perfection as possible; yet not for the sake of its own power and glory (for these soon pass away), but that it may transmit so much of added power and organic perfection to the common stock of the race of which it is a part. Nature's aim is higher, broader, richer life; better forms for retaining and maturing life; organisms in which intellectual emotion and skill shall attain mastery over brute force. Though the individual, therefore, is instinctively compelled to live and struggle for self-existence, yet the outcome of individual existence is by no means confined to the individual career and attainment, but it goes to

shape and modify the current of this unceasing tide of ascending, universal life.

What, then, is the application of this lesson from nature to the problem of the relation between individual man and human society? The lesson, in its first part, is plainly this: There can be no sound plans for the development of human society, no social-reform schemes, no settlements of disturbing social problems, which ignore and try to leave out of account this element of natural energy applied to individualistic ends; this instinct to seek, acquire and preserve the things that gratify individual life. The instinct may take a high form or it may take a low form. It may be degraded to the miser's passion, which merely clutches and hordes possessions without caring for their uses; or it may appear in the daily industry and economy of the mechanic, to the end that he may have a house of his own for his wife and children, and put within it the things that shall make it a home; or it may show itself in the sagacity and enterprise of the merchant or manufacturer, who easily makes a millionaire's fortune, while he organizes industries on a large scale and furnishes employment to a whole community. The impulse to individual acquisition and to secure a more advantageous position in the world may, of course, be nourished to excess and become an unjust and grasping passion; it may grow abnormal and become a disease; but in itself it has been such a fundamental condition of the world's evolution and progress, both in physical nature and in humanity, that I think that those persons who now propose to reorganize society without this factor should understand that their scheme not only revolutionizes human society to its foundations, but goes below humanity to antagonize the order of things in nature; and for success, therefore, their first measure should be to ask for a different plan of the universe than that under which mankind have come into being. Dangerous as is the impulse to individual acquisition when developed to excess, it is not so fatally dangerous as would be the organization of society without this impulse at all, if such a thing were possible. The former produces very serious evils, but evils which society as it advances may throw off. But the latter would produce stagnation and stop the wheels of all advance. With all its evils, the impulse to individual property, individual freedom, individual advantage, has been the main motive-power of the world's progress. It has been the nourisher of noble ambitions. Through it human faculty has been elicited, intellectual resources have been developed as would not otherwise have been possible, and character has been disciplined to self-control and to mastery of material forces. The time certainly has not yet come for omitting this factor from the motives of human activity.

But there is a second part to nature's lesson. The various schemes of social reorganization that are pro-

claimed have their cause in certain social evils which cry aloud for remedy. The ambitions and energies of individuals in enlarging the sphere of their own existence, though to so great an extent the motive-power of civilization, are constantly running to excess and driving on rough-shod over the weaker members of society. Hence, there are wrongs, injustices and cruelties; selfish and despotic assertion of power on the one side, unjust deprivations and slaveries on the other side. Yet here, too, nature may teach us and indicate the remedy. In the lower realm of life, while the individual is carefully trained as a concentrator and distributor of vital energy, the individual development, activity and aggrandizement are not the end. These, we have seen, are only instrumental. The end is the furthering and improving of the life of the species. The end, therefore, is not individual, but general, universal. The same law holds good for humanity, with the added force that it becomes for humanity a moral law. Individual human beings, through the instincts of self-preservation and self-aggrandizement, which are by nature especially strong in the earlier years of life, are made concentrators of those energies which keep the whole social organism in healthful activity and progress. Nature has put a tremendous force into these instincts and has thereby produced strong individual agents as effective centers of her power. But individual acquisition, pleasure, power, are not the end with man more than with the orders of life below him. The end is the common good, the general well-being. Every individual right maintained, every individual acquisition gained, every position of individual advantage secured, carries with it a corresponding obligation to society.

And here is where the law of ethics and the obligations of religion bear upon social problems. Man knows through his reason and conscience that there is a higher realm of life than that which is indicated in the natural impulse to seek individual property, pleasure and power. He knows the higher and larger objects which all individual acquisitions should be made to serve. He is gifted with the faculty to judge life by its mental, moral and affectional wealth. Though he sees that no statute-law can or ought to equalize all human beings in respect to faculties, acquisitions or influence, yet he recognizes that the law of justice should come to the aid of the weak and ill-conditioned against the encroachments of the strong and the excesses of self-interest, and that precisely in proportion as any person has been able to utilize the vital energies of the universe to his own profit and power, such person owes back to the universe a corresponding service of benefit. The special acquisition, whatever it be—wealth, sagacity, learning—is not his to use for his own selfish pleasure and increased advantage. It belongs to the great world-forces whence it came. Their aim is ever larger,

better, nobler life, and to the furtherance of that aim he is bound by the highest moral and religious obligation to give back his special talents with interest.

Nor let it be said that this is to apply a merely ideal ethics to evils that require the stern treatment of law and governmental authority. Statute-law should, indeed, be dictated by justice, and governmental authority must meantime keep the peace between clashing self-interests. Yet the appeal to moral law is no idle nor ineffective method for dealing with practical social evils. Again and again have classes and races of mankind been lifted to the enjoyment of their rights and liberties by the surely wrought effects of that appeal. These are the meliorations which mark the progress of the higher civilization, for which individual self-interest and enterprise only furnish the rough material.

THE NEED FOR FREE THOUGHT EDUCATION.

BY THOMAS DAVIDSON.

How little the American people really understand the nature of true freedom is shown by the disrepute which attaches to the term *free-thinker*. The merest tyro in ethics knows that free thinking is the very first condition of all freedom; that without it no freedom of any kind is possible. The man, or body of men, that can enslave thought, that can dictate what others shall, and shall not, think and believe, has his gyves on the wrists, and his hand on the throat, of Freedom. Nay, more, he who would bind Freedom hand and foot, must put a stop to free thought. If thought be free, all else will soon be free; if thought be in bonds, all else will soon share its captivity. And this the oppressors of the earth have at all times known but too well; they know it but too well to-day. The greatest foe to human liberty at this hour, the greatest foe to our Republic and all that it means, is the Church, which combats and discredits freedom of thought.

Partially conscious of this, we have, in our political theory, drawn a sharp line between the State and the Church, declaring that the two have separate and independent functions. So far, this is well. But, so long as the Church is allowed to teach her doctrines, without being called upon to defend them at the bar of science, so long will she exercise a darkening and enslaving influence upon men, so long will she unfit men for being worthy citizens of a free Republic.

And yet, while the Church is so strongly entrenched in the affections, habits and prejudices of the people whom she has enslaved, we cannot hope to cite her before the bar of reason and compel her to show cause why she should not be treated as a spiritual charlatan. Indeed, so far has the tyrannical influence of the Church extended that even men who are ready enough to dis-

pute her claims have been bamboozled into thinking that it is bad taste to speak against them. Charlatanry has surely won its crowning victory, when it has stopped the mouth of honesty and surrounded itself with the halo of reverend sainthood.

But, though we cannot at present call upon the Church to substantiate her supernatural claim to direct and enthrall men's thoughts, we may do something to weaken her influence and to protect a portion, at least, of our people from her obscuring teachings.

It may, perhaps, be thought sufficient for this end, if young people are prudently kept away from those places where these teachings are to be heard, and if such teachings are excluded from the public schools; but this is, in reality, a mistake. If we will protect young people from ecclesiastical obscurantism, we must go farther than this and put something in the place of the Church's teachings. The truth is, these teachings are pretended solutions of questions that not only exist, but that force themselves upon every thoughtful man and claim his deepest attention. To put men off, as the Church does, with an authoritative answer, which is, indeed, no answer at all, is a piece of the most utter frivolity, an unsurpassable lesson in intellectual impiety and dishonesty—the source of all other dishonesty. The great questions with which the Church deals we must ourselves take up, bring them to the attention of young people and encourage these to exercise their deepest reflection on them. It is by no means necessary that we should offer complete answers to these questions, as the Church does; indeed, we cannot do so, without imitating the Church's impiety; but we can state the questions correctly and encourage persons to place themselves in an earnest, scientific attitude toward them. Only in this way can we rear a race of earnest men, bravely conscious of their own limitations and of the awful mystery that surrounds their lives.

I think the advocates of free thought have been far too remiss in this matter. They have not sufficiently guarded those whose education was in their hands from obscurantist influences, and they have not prepared any means for increasing, by a rational and scientific education, the number of intelligent and devoted free-thinkers. While every obscurantist sect, small or large, has its educational institutions, in which its soul-enslaving dogmas are taught and impressed with more or less tremendous sanctions, free-thinkers have not a single institution where pure science and the earnest scientific attitude with reference to all questions are inculcated; nay, they even permit institutions founded, like Girard College, for the furtherance of free thought, to fall into the hands of enslaved thinkers.

And, yet, it is perfectly evident that our battle for free thought against the powers of time-honored charlatanry will be in vain, until exercise in free thought is

made an essential part of education, until perfect piety of intellect is made the basis of morality. It is not enough to refrain from the Church's teachings and methods; we must replace them by other teachings and methods. Above all, we must have institutions where there is an atmosphere of free thought—a thing which is sadly lacking in our public schools and in many higher institutions of learning that do not professedly teach the Church's doctrines. Our attitude toward science in the highest things must not be merely negative to the Church's attitude, it must be positive. If we could only make it so, we should soon come to the conviction that our public education needs to be reformed from the very foundation—to be stripped of its mediævalism, its sentimentality, its formality, and placed upon a basis of science and of nature.

I shall never believe that the free-thinkers of the United States are really in earnest, until they begin to establish schools of their own for the diffusion of the principles and methods of free thought. Here we have much to learn from the Roman Catholic Church, whose members, while compelled to pay their share of the public school tax, nevertheless establish schools of their own, in order that their children may be reared in the teachings and atmosphere of their faith. If free-thinkers had half the earnestness of Roman Catholics, free thought would make more rapid progress than it does.

I hope a new impulse will be given to free thought and intellectual piety by THE OPEN COURT. If so, I wish to take advantage of that impulse to call the attention of free-thinkers to the need of a new education conducive to free thought. I wish to see whether, among the open-handed free-thinkers of our country, there be not one or two who would turn their liberality in the direction of an educational institution for the children of free-thinkers, and whether there be not earnest-minded teachers, weary of the trammels of orthodoxy and intellectual slavery, who would combine to establish an educational institution pledged to impart a scientifically-based education extending to all the faculties of body and soul. I am convinced that the results attained by a single such institution, managed by persons aware of the magnitude and importance of the enterprise, would be so striking that it would soon be imitated throughout the length and breadth of the land, wherever there are men and women that have not bowed the knee to the Baal of authority and habit.

What is needed, to begin with, is an institution of higher education, a college or academy for young men and women who have arrived at that period of life when they begin to frame for themselves a theory of the universe and of life and to lay out their life plans. It is then that young people can best acquire that habit of earnestness and piety to truth which is the very

essence of free thinking. Who then will aid in raising that first bulwark of free thought—a free-thought college?

KATZENJAMMER.

BY W. D. GUNNING.

Katzenjammer is a German word which means "cat-sickness." Our neighbors on the Rhine express by this word a mood of mind or malady of body which results from night-life.

The cat, as every one knows, is addicted to the old vice of the feline race, nocturnal wanderings, leading often to noisy demonstrations on roof-poles. Domestication has not eradicated the old jungle-habit of the race.

If there is one lesson which nature teaches to all her children more clearly than any other it is that day is the time for action and night the time for sleep.

"Now came still ev'ning on and twilight gray
Had in her sober liv'ry all things clad.
Silence accompanied; for beast and bird,
They to their grassy couch and these to
Their nests were slunk."

This is Milton's picture of nature in times when the world was paradise, that is, a garden of delight.

From the inwreathing of Orion's nebula will come the axial rotation of the planets to be born of that nebula. The oldest fact recorded in the history of a globe is its axial rotation. But when the stomach came nature was stronger in hunger than in the rotation which brought the alternation of day and night. Struggle to supply the need of the stomach drove many forms of life into night-work. The owl, the night-hawk, the whip-poor-will became nocturnal. All the felines became night-prowlers.

Nature, speaking one language to her children in light, spoke another language in heat. The sun with his shafts of light to waken the sleeper sent shafts of heat to drive him deeper into the shade. All tropical lands have been given over to Katzenjammer. Like the stillness and solitude of a polar night is the stillness of a tropic day. Like the noises of Bedlam are the screechings and howlings of a tropic night. Our own Arizona, in summer, is a scene of Katzenjammer. Neither insect nor scorpion nor rattlesnake will disturb you by day. The heat makes them nocturnal. As the cat, transplanted to other climes, retains something of the old equatorial cat, so does tropic man, transplanted, retain a tendency to night-life. I have observed in the colored men of the South a strong tendency to Katzenjammer. The pine woods of Florida are often vocal with their night melodies.

We have gone astray with the cat. Katzenjammer is an old disease and in one phase it has killed more human beings than all microbes, those shafts of unarmed Mars. I have sometimes thought that the best act recorded of any god was an act of father Zeus on

Olympus. Zeus was not permitted to rattle a thunder-bolt at a man without the consent of the synod of gods. He was not allowed to hurl a bolt without the consent of the Involuti, the solemn veiled gods. Once, from his throne on Olympus, he saw a man at the foot of the mountain in the most unnatural Katzenjammer. He sprang to his feet, seized the hottest bolt in the armory of Olympus, wrote on it *sus philco* and hurled it at the unnatural wretch. It struck and stuck and from that day the disease which spread among mortals has been known under the name which Zeus wrote on his thunder-bolt. The only crime which was flagrant enough to cut the red tape of heaven was that which gendered a contagious and hereditary scourge. That scourge has destroyed nations. The Katzenjammer of King David destroyed the autonomy of the Jews. The debased old King died of the disease gendered, according to Greek mythology, at the foot of Olympus. The bolt which Zeus threw, by a fiat of Olympus or Sinai or Meru, or any other god-throne, would stick in his posterity to the end of his line. Solomon came with the bolt which rotted the loins of his father, burning his blood. Rehoboam came, a copy of his father Solomon. Then came the cry "To your tents, O Israel," and the Jewish nation was rent in twain.

What a young fellow for Katzenjammer was Alcibiades! Politician and night-prowler he was. The Athenian dinner party was, like our own, an affair of the night and the bill of fare, like our own, was written in a foreign tongue. Unlike our own, it was not graced with the presence of woman. At the Athenian dinner party, Socrates, who, with all his virtues, was somewhat addicted to Katzenjammer, was a good symposiarchos, a *majister bibendi*. He is said to have played on musical instruments late at night and doubtless this was the real and sufficient cause of his taking off. But the best picture of Athenian night-life was Alcibiades prowling about the streets and entering, an unbidden guest, any house where he saw the lights and heard the night revel. His cat-sickness, Katzenjammer, wreaked itself in the cutting off of the tail of his dog. Katzenjammer was a large factor in the decline of Athens and the chief factor in the fall of Rome. What a Katzenjammer band was that of Cataline! What Katzenjammer was that of Nero, fiddling to the light of burning Rome!

Still greater was the Katzenjammer of Ahasuerus, written in Hebrew scripture. This great king, with his court and his satraps, was on a drunken revel one hundred and eighty days. It closed in a grand climax lasting a week. The government of Persia was gloriously drunk. The king sent messengers to Vashti, the queen, demanding that she present herself to his night revelers. She refused to go. Her language is not reported, but I think the letter she sent to her husband was in words like these :

MY DEAR HAS :

When you have had enough of this Katzenjammer and you and your ministers of state and satraps are sober and washed and your palace is fumigated it will give me pleasure to hold a reception with you. But you will excuse me from presenting myself as an exhibition to the caterwauling government of Persia and Medea.

Your most loving,

VASHI.

What was the sequel? - Vashti was dethroned and divorced, the Supreme Court of Persia deciding that such an example of insubordination must not stand as a "precedent" to other wives. The Supreme Court of Persia made a sort of Dred Scott decision. It ruled that a decent wife has no rights which a drunken husband is bound to respect. (Lawyers and judges who, time out of mind, have sought the highest wisdom in the remotest antiquity, may find this decision in Parmashata Reports, Volume 28th, Has vs. Vashi; decision rendered by Chief Justice Parshandatha; associate Justices, Daphlon, Aspasha and Hammedatha; no dissenting opinion. Our courts, reverend conservators of society, will find much in this decision to buttress their opinions on the woman question.)

Ahasuerus then married a Jewess whose name was Esther, and this Esther, with the crown of Vashti on her brow, instigated a bit of night-work on her own account. It began with the hanging of Haman and ended with the murder of seventy-five thousand men, women and "little ones." No; this was not quite the end. Ahasuerus called on the godly Esther and said (I give a free translation): "My dear, your wishes have been carried into execution. I cannot tell you exactly what has been done in other parts of the kingdom, but here in the royal palace alone are five hundred murdered men lying in their gore. You can dabble your hands in their blood if you wish. And now, my dear, my lamb, is there anything else I can do for you?" And Esther said: "Yes, let men hang. (This is literal.) Let the Jews do to-morrow as they have done to-day and let the ten sons of Haman be hanged." And Ahasuerus said: "Very well, my dove, it shall be done according to the sweetness of your will." It was done, and a modern pulpit, whose name is Talmage, preaches a sermon in praise of the noble Esther and reprobation of the "flashy" (his own word), the flashy Vashti.

This is rather a sickening sequel to a hundred and eighty nights of Katzenjammer. I am afraid that Will Shakespeare was addicted to a mild sort of Katzenjammer. Byron's life was filled with Katzenjammer and the vices incident to night-life. Byron died early of cat-sickness. And poor Burns, instead of going to bed early and honestly like his Cotter, went Katzenjammer like his Tam O'Shanter.

"Give me a canny hour at e'en,
My arms around my deary"

I am afraid the canny hour with his Anna was long drawn out.

"The Church and State may join to tell,
To do such things ye maun na,
The church and state may gang to hell,
And I'll gang to my Anna."

The Church and State were right and Burns went to his Anna—and his grave. How fares it with us? The army of night-toilers is increasing and night-revelers are multiplying. The world of business and fashion dines at six and goes Katzenjammer till the small hours of the morning. Our White House was given over during the last administration to social Katzenjammer—and the President is dead.

"Can these things be
And overcome us like a summer's cloud?"

The struggle of the organic world is two-fold, for sunshine and for nutriment. What has sent the Sequoia of California spiring up into the heaven three hundred and fifty feet? Search for the sun. Environed by shrubs this tree itself would have been a shrub. But its neighbors are pines and cedars which rise to the height of two hundred feet, weaving a curtain of interlacing bows between the sun and the weeds below.

Plant your potato in a cellar and mark the pale and sickly hue of the vine which attempts to grow from it. Its disease is Katzenjammer, that is, night-sickness. Look at your pea-nut. Struggle against enemies in the air has driven this member of the pea family to develop its pod in the ground and the vegetal virtues which come from impact of light and actinic beams of the sun are wanting in this plebeian nut—which is no nut at all. Look at the mole and then at the bat. Their embryotic history shows that they were derived from a common ancestor. Struggle for life drove certain members of this family higher into the air and others into the ground. The sun-seeker gained in eye and brain. The earth-burrower lost its eyes and retained only brain enough to guide it through the ground. The bat lapsed when it fell into Katzenjammer, that is, night-prowling.

I do not know what was the health of the tiger and lion before they went into Katzenjammer. The dissecting knife of Gerard shows that now these nocturnal felines suffer much from consumption. I know not the flavor of the ancient pea before it became a pea-nut. I know that the topmost, sun-drinking peach has a richer flavor than the peach below. I know the character of the ancient orange which grew in the shaded recesses of the tree, for it survives in the wild orange. I know that the fruit grew luscious as the tree learned to push it out on the sun-lit periphery.

On the tree of life where now is our peripheral humanity? With less wisdom than the orange tree Igdrasil has been pushing its human fruit inward to the shade. We want a peripheral humanity, lit by beams of science and sweetened and mellowed by actinic rays of the sun of righteousness.

In these thoughts I am saying my words of welcome to a new-born journal which through long years to come may do noble work in winning men from spiritual Katzenjammer. Scratched and thorned your hands may often be in trying to reach the shaded, centripetal fruit on Igdrasil and bring it out to the periphery. Ancestral tendencies are against you, but they are not omnipotent. By pruning and enriching I have lifted the state of an orange tree, abolishing thorns and letting the sunlight in to dispel the infestations which in dark coverts were eating the tree's life. In hopeful moods I have thought that I may have wrought similar amelioration on men, here and there a man, causing thorns of bigotry to abort and sending shafts of light into the dark recesses of the mind where infestations of superstition were eating the soul's life.

Prune and fertilize; fertilize to fullness of life and healthful growth and the *vis viva* will prune. Let your shafts of light in on the dark coverts where superstitions do knot and gender.

In the *darkest* covert dwelt Yahweh, the god of Israel. No beam of light pierced the shekinah, the holy of holies, where Yahweh was enthroned. Even his throne on the firmament was pavilioned with darkness.

"He bowed the firmament and came down
With storm-clouds under his feet.
He rode on a thunder-cloud and flew
And shot forth on the wings of the wind.
He veiled himself in a mantle of darkness
And shrouded himself in dark waters and masses of cloud."

His shekinah to-day is the sunless recesses of the human mind. Let the shekinah of your temple be all ablaze with light! Couch not, shudder not, before the awful sanctities of darkness.

KING VOLTAIRE.

BY FREDERIC MAY HOLLAND.

The seventy years of preparation for the French Revolution can have no name so appropriate as the Reign of Voltaire. His literary influence began in 1718 and gradually became greater, especially during his last thirty years, than any other author has ever wielded consciously for so long. Luther's leadership was comparatively brief, and Goethe's had no such definite aim or triumphant success. No other thinker ever saw the great reform, which cost him a whole life in exile, finally become through his efforts universal and permanent in all civilized lands. Rightly does Lowell say that: "To him more than to any other man we owe it that we can now think and speak as we choose." He led Europe out of the persecutions and religious wars which had cursed mankind ever since the advent of Christianity. The tolerant and otherwise human measures of Frederic of Prussia and Catherine of Russia were avowedly accomplished under his direction; and so,

in reality, were the corresponding reforms in all Roman Catholic lands. Even the Pope acknowledged Voltaire's primacy and, when he playfully expressed a wish to get the ears of the grand inquisitor, sent him word that the inquisition no longer had either ears or eyes. The English sovereigns and archbishops openly favored his great work; as did the Swedish, Danish and Polish monarchs; so that he said: "I always manage to keep four kings in my hand." Goethe calls him the universal source of light; Condorcet declares that no one else ever had such an empire over men; and Rousseau confesses that from him came his own original inspiration. Among other contemporaries who owned Voltaire's supremacy were Chatham, Franklin, Turgot, Diderot, D'Alembert, Gibbon and Goldoni. No wonder that his out-of-the-way retreat was crowded with admiring visitors; or that his last visit to Paris was such an ovation, as was never received by any other author. It was all the more glorious because the nominal king did not dare to let him enter the palace or be honored with a public burial. Even the announcement of his death was forbidden, in a terror amply justified in 1791, when free France carried his ashes to the Pantheon, with such universal homage as few other dead men have ever received and none of them deserved so well.

His greatness as an author would be more apparent if the man had not been greater still, so great, in fact, as to devote himself, from first to last, to fighting one of the worst of evils, with a zeal which made him seek to give point and force, rather than luster or finish, to his works, and own that he had too much baggage to reach posterity. He wrote for his day; and it was dark and bloody enough to need every word. The wealth which he won in commerce was freely spent in finding readers. Among his most kingly words are these: "Those who say I sell my books are wretches, who try to think in order to live. I have lived only to think. No, I have never peddled my thoughts!" His use of more than a hundred fictitious names is not like an ideal king; but most of the actual ones have been only too ready to employ worse frauds. Very few have been so ready as he to take sides with the persecuted. His treatise on *Toleration*, which, according to Franklin, dealt bigotry so unexpected and heavy a blow as was almost fatal, was called out by a wrong which the government at first refused to right, and which his friends advised him to overlook. An aged Protestant, named Calas, was tortured to death at Toulouse, early in 1762, on the charge of having murdered his son, in order to prevent his conversion to the Catholic church, which had, in fact, so blighted the young man's career as to make him hang himself. All the property was confiscated, and the daughters of the family were imprisoned in convents in order to force them into apostasy. This outrage on Protestant girls had long been customary and had been

joined in by Fenelon. Another such victim, Elizabeth Sirven, had been scourged into insanity and had drowned herself soon after her release. Her father, mother and sisters escaped the fate of Calas by a flight which left them beggars and cost the life of an unborn child. Both families found a deliverer in Voltaire. It cost him 50,000 francs and three years of constant labor, including the writing of countless letters and the publication of seven pamphlets, to get the sentence of Calas revoked, the daughters released and the family provided for. To obtain justice for the Sirvens took ten years, though their trial had lasted but two hours. These iniquities were probably not the first of the kind; but we owe it to Voltaire that they were the last; just as his protests, when La Barre was beheaded, in 1766, with the approval of Louis XV., for some boyish ebullitions of irreverence, saved the history of France from being stained by any more such records. This time, however, the sentence was not annulled; nor was another of the young blasphemers, who had fled to Prussia, ever permitted to return. Indignation at these outrages and their apologists moved Voltaire to keep St. Bartholomew's day in anger and humiliation (while Toulouse and other cities made it a public jubilee), to sign letter after letter with that war-cry against the bloody church, "*Ecrasez L'Infame*," to write his sharpest books and to scatter them broadcast by every artifice. He was nearly seventy at the time of the execution of Calas, but before reaching eighty he published a hundred new books, mostly satires of the persecutors, or pathetic pictures of the sufferings of the victims, among whom Servetus was not forgotten. To this period belong some of his most impressive and original writings, those tales now fortunately accessible to English readers in Eckler's spirited version. And he then compiled, in part from matter already published, that stupendous arsenal of weapons against bigotry, the *Philosophic Dictionary*, of which a good translation was bequeathed us by Abner Kneeland. The main difficulty in giving any adequate idea of the merits of Voltaire's writings is that the keenness of his wit is dulled by handling. Perhaps this extract from a work of his not yet translated, nor likely to be, *Le Sottisier*, may give some hint of the pleasure which can be enjoyed by reading him in the original. A Jesuit was once asked, why so many fools were admitted into his order. "Oh, well," he answered, "we have to have some saints of our own." But Voltaire's best works were those commemorated in the inscription placed upon his sarcophagus, in the majestic ovation of 1791, "He avenged Calas, Sirven, La Barre."

With these names was recorded that of Montbailli, who was executed on a false charge of murdering his mother. His innocence was established, and his wife saved from perishing likewise, by Voltaire. One more name, at least, ought to have been placed beside these

four. General Lally had been beheaded in 1766 as a traitor, because he could not prevent the English from conquering India. For thirteen years he had an indefatigable champion, who called himself "The Don Quixote of the unfortunate," kept busy at it night and day, even when he was almost eighty, and signed his letters as "The Ghost of Voltaire." Finally, as he was on his death-bed, a message came, saying that Lally had been pronounced innocent. He ordered the good news to be written out in large hand and set up before his eyes, and then dictated his last letter to the son of the murdered soldier, saying that the dying man revived at hearing of this great act of justice and would die in peace. This we know he did, four days later, May 30, 1778. He had the more right to do so, as he might have thought, not only of the Sirvens and Calas, but of other Protestants rescued from the galleys where they had been sent for sheltering their ministers of girls made happy and honored mothers, instead of wretched nuns, of cottages built and marshes drained for poor peasants, of large sums loaned without interest, of debtors released from prisons, of servants assisted by the master they had robbed to escape the gallows and become honest men, of free schools, plantations of trees and great improvements in agriculture, of the reduction of taxation throughout an entire province, of the sale of grain at low prices during famine, of a colony of more than a hundred families of exiles furnished with comfortable homes and provided with the best of markets for their watches and other manufactures, of a hospitality which filled his house, not only with transient visitors from all parts of Europe, but with permanent dependents, so that Ferney has been called a Noah's Ark crowded with all the wild and tame beasts; of a boundless charity attested by a formal declaration of the village officials, that no one who dwelt there had ever asked relief in vain, and of a sunny gayety and courtesy which kept his home always bright. He delighted to say: "I have done a little good; it is my best work." He would have done much more if greater heed had been given to his entreaties, that war should be given up, all serfs emancipated, women kept no longer in subjection, all classes protected equally, commerce relieved from heavy tariffs, the clergy and nobility compelled to pay their share of the taxes, meat allowed to be sold and eaten in Lent, Paris supplied with water-works, the weights, measures and laws made uniform all over France, capital punishment restricted greatly, or else relinquished, trial by jury introduced, torture of prisoners and confiscation of property of criminals abolished, lawyers heard for the accused, witnesses examined publicly and prisons cleansed from the diseases then so deadly. "You have a right to say, 'The nations will pray that their kings may read me,'" writes an admiring monarch.

Voltaire was more of a reformer than a revolutionist. His earlier writings praise England as a political model; but in 1762 he published his opinion, that the best of all governments is a republic. His declarations, that all men are born free and equal, and that despotic and monarchical mean the same to all sensible men, were made before our Revolution, which he favored so warmly as to lament the reverses of the Continentals and strike a medal to Washington. A quarter of a century before the taking of the Bastille, he stirred up great excitement in Paris by predicting the French Revolution. Rightly did it honor him among its prophets. After it had failed for the time, his memory was still so mighty against Napoleon, that he did his utmost to blacken it.

It was love for liberty and humanity which led Voltaire to make war upon Christianity, then much less innocent of cruelty or tyranny than now. His main arguments are the persecutions which the Church was then carrying on, and the atrocious precepts and examples in the Old Testament, still too much in honor for the safety of morals. Ingersoll's indictment is not more complete or more witty than his; but Voltaire was much less shocked by the absurdities in the Bible than by the immoralities. He anticipated Colenso, and declared that, if he should see the sun stand still and the dead arise, he should exclaim: "Behold the evil principle undoing what the good has wrought!" But he objects to no miracle so sharply as to that of Ananias and Sapphira, which enabled the clergy to say: "Give me all thy property, or I will bring about thy death." He calls Paul the real founder of Christianity, but always speaks of Jesus with respect, saying: "He would have condemned our Christianity with horror," "I defend Jesus against you, in denying that he scourged the innocent buyers and sellers in the temple, or drowned the two thousand pigs and withered the fig-tree, which were the property of others." Among the texts against which he protests is: "Wives, submit yourselves unto your own husbands, as unto the Lord." He pictures a fair Parisian reading this for the first time and throwing down the book. She is told that the author is St. Paul, but answers: "I don't care who he is: he is very impolite. My husband does not write to me in that way. Are we slaves? Nature does not tell us so." The sight of all these errors did not lead Voltaire to deny the necessity of religion; though to the question what he would put in place of Christianity, he answers: "What! A ferocious animal has sucked the blood of my neighbors; I tell you to get rid of it; and you ask me what is to be put in its place?" His own faith in God was proof against not only the sins of his worshipers, but the defects of his works, though the Lisbon earthquake made it necessary to suppose that there are limits to his

power. Voltaire was undoubtedly sincere in building the first church ever dedicated to God; and we may hope that there was something besides cowardice in his occasionally taking the consecrated wafer and expressing, on his death-bed, his hope to die in the Catholic religion and be pardoned by the Church. It would have been more manly, if not more kingly, for him to have adhered to the declaration made a few days earlier: "I die worshipping God, loving my friends, hating none of my enemies and detesting superstition."

He found much that deserves hatred in what was then called religion; and he pointed this out so plainly that he holds a place in history among the unbelievers. This makes it important to remember that he is one of the great philanthropists. It would be scarcely fair to say that he was a philanthropist, because he was an unbeliever. Voltaire was an unbeliever, because he was a philanthropist.

The real grandeur of his life cannot be realised without careful study of such biographers as Parton and Morley in English, Pompery, Bungener and Desnoiresterres in French, or last and best of all, the German Mahrenholtz. His irritability, vanity, duplicity and timidity are not to be denied; but they did not make him less of a king than Louis XV., who sinned much more deeply against the seventh commandment. All Voltaire's faults are unimportant in comparison with that broad and lofty philanthropy which he practised constantly, even toward those who wronged him, and which he often expressed thus: "The noblest privilege of humanity is the power of doing good." "I know of no really great men, except those who rendered great services to our race." "I am ashamed of having peace and plenty in my own house, when three-fourths of Europe suffers." "My health grows weaker day by day; and I must hasten to do good." "The more we think, the less unhappy men will be; you will see golden days; you will make them; this idea brightens the last of mine."

Descartes set about explaining the phenomena of the two worlds—the world of thought and the world of extension. But, in order to operate on a sufficiently solid basis, he let unwittingly slip in two more suppositions. He assumed in support of our thinking a permanent unitary substratum, calling it thinking *substance*. And dealing similarly with extension, which he believed to be the fundamental characteristic of the outer world, he assumed an extended *substance*.

These sundry distinctions form the leading principles or elements of his system. And it is an historical fact that most problems which have occupied modern philosophy have grown out of the attempt to unify the various existential presuppositions thus prominently brought to notice by Descartes. For genuine thinkers cannot rest satisfied until they believe they have discovered the veritable bond of union that holds together the divers facts of the universe. The multifarious phenomena of our varied world, how they come to form the one closely connected whole which we mentally realize, this precisely is the quest that from time immemorial has been the ruling passion of the philosophical mind.

The most stubborn of all difficulties in the way of unification arose at once from the impossibility of conceiving how the two substances of our known world—being evidently, as a matter of fact, in closest intercommunication—at all manage thus to influence each other. It is obviously quite incomprehensible how a material substance, with its space-occupying motions, can in any way affect or be affected by a spaceless mental entity possessing no parts to be moved and having no sort of community of nature.

This psychophysical riddle has ever since formed the central problem of philosophy and the most essential impediment to any kind of monistic view. In spite of all efforts at solution, it remains to this very day utterly unintelligible how the mere moving to and fro of brain-molecules can at all induce or cause the conscious state, with which we actually find it connected, or how our spaceless and, therefore, immovable volition is capable of imparting motion to our bodily members.

The Cartesians, in order to account for so utterly enigmatical an occurrence as the intercommunication of body and mind, felt compelled to assume what they called a *concursum divinum*, each time body acted on mind or mind on body. And with this introduction of miraculous intervention they here, at the start, relinquished for good the philosophical ambition of constructing a monistic world-conception.

The monistic task was, however, soon undertaken from another point of view. Descartes himself had expressed the idea, without working it out, that the two substances may possibly exist united in the divine being. Spinoza, through monotheistic and cabalistic associations probably already predisposed to Monism, devoted

MONISM IN MODERN PHILOSOPHY AND THE AGNOSTIC ATTITUDE OF MIND.

BY EDMUND MONTGOMERY.

Part I.

Descartes opened what is generally called modern philosophy by pointing out, as immediately evident, only our own individual thinking. He then professed to discover, as innate part-content of such thinking, the certainty of the existence of a supreme being. And, as deception is altogether incompatible with divine perfection and holiness, he thought, moreover, that our unhesitating belief in the existence of an extended, outer universe must necessarily be grounded on its actual reality.

With the help of these three existential statements,

the best part of his beautifully contemplative life to the philosophical unification of the divers and disconnected principles of the Cartesian system. This he conceptually effected by imagining the supreme being to be itself an absolute, all-containing substance, of which thinking and extension are but two of an infinite number of other, to us, unknown attributes. The different bodily things he looked upon as so many divers modes of the infinite attribute of extension and the different souls or minds as so many special modes of the divinely-rooted attribute of thinking. And, harmonizing both spheres, he assumed, in eternal accordance, the order and connection of thought to be ever the same as the order and connection of things. The divine substance, with its attributes, is thus the *natura naturans*, the all-enfolding matrix and manifesting ground of the individual souls and extended things which constitute the *natura naturata* or that which assumes conscious and particular being through partial revelation of the all-comprehending and undivided potentiality of God.

This kind of Monism, based on our conception of substantiality, to which Spinoza gave most perfect and classical expression, a Monism identifying God and nature—*Deus sive natura*—has always irresistibly fascinated many of the greatest minds. And when we remember the pantheistic turn all religions are apt to take; when we consider, furthermore, what a central influence, through the Eleatic sages, the same monistic conception gained on the philosophical thought of antiquity; what vivifying inspiration during all the rigid lengths of the middle ages it has afforded to the religious contemplation of Christian mystics; how, in the rise of modern free thought, it nerved to sublime martyrdom the dauntless mind that first on our earth conceived the infinity of worlded space with one mighty pulse of quickening power throbbing through it all; what source of liberating enthusiasm and rapturous delight Spinozism, with its *Gott trunkheit*, then came to be to such men as Lessing, Goethe, Novalis, Schelling, and through them, to the whole civilized world; what honor has been done in our own days to that once so execrated name by representative thinkers of all nations and denominations; when we consider all this, we may rest assured that the Monism of Substantiality will not soon lose its magic spell over the brooding mind of man.

Yet, nevertheless, it is clear that within, as well as without, the divine substance the phenomena of thought and those of extension remain to our understanding totally unrelated to each other, so far, at least, as their actual intercommunication is concerned. This philosophical inclusion within one and the same absolute renders in no wise intelligible how the experienced interaction or correspondence is brought about. Indeed, Spinozistic Monism really rests on the erroneous identification of logical reason in the sphere of thought

with actual cause in the sphere of reality. Its principle of explanation is *ratio*, not *causa*. A logical reason, however, though definite concepts may consistently follow from it, is utterly impotent to produce any effective display whatever among the actual things of the extended universe. And this alone is sufficient reason why Spinozistic Monism cannot be a correct interpretation of our world.

To the orthodox world Spinoza's naturalistic pantheism seemed simply an impudent and offensive display of atheism. Yet, for all that, among the faithful themselves, the same monistic propensity labored through Father Malebranche's meditation to bring comprehensive unity into Descartes' distracting trilogy of God, Thought and Extension.

Had not Descartes when, while doubting everything, he began to cast about for immediately evident reality and truth, actually found the idea of an all-perfect God as the most certain of the contents of thought? And was it not this certainty of the existence of such a most real being that alone rendered sure the reality also of the extended world? It is quite clear that our perception of things is no effect or result of our own doing. It is clear, also, that extended things cannot of themselves affect in any way our thought; consequently, it is only through God that we perceive them. We have obviously no perception of things save in the world of thought. These things in the world of thought come to us through God. Therefore, we see all things in God and, "with St. Paul let us then believe"—so exclaims Malebranche—"that in him we live, and move, and have our being."

The reverend Father, entangled in these monistic thoughts, innocently believed he had saved his orthodoxy—which prescribes a personal creator separate from created things—by simply declaring that these things, besides being seen by us in God, have also an existence of their own external to God.

Many of our theologians, at present, partly or wholly imbued with the Monism of transcendental idealism or with that of substantiality, are laboring with all their might to reconcile the two utterly incompatible conceptions, the conception of personality, namely, with that of immanency. Persons, indiscernible, ever identical monadic existencies, can neither include *as part of themselves* other persons or things; nor can they be included as *integral part* by any kind of other substance or being. It is of the essence of personality to be rigorously autonomous. Leibnitz rightly said monads have no windows and he made them, consequently, evolve all their conscious states from within, every monad in utter isolation, only for itself. This compelled him to have recourse to miraculous intervention, in order to make the countless hosts of monads compose—in spite of their separateness—our one,

all-involving cosmos of interacting existents. Leibnitz who, with his keenly logical mind, had long dwelt on the subject, knew right well that the conception of an autonomous, spiritual entity excludes the possibility of its acting on other existents or its being acted upon by them. It is a fanciful illusion to indulge, as many do, in the notion that such a spiritual entity, by getting somehow a body, may become competent to act by means of it on other spiritual entities. The construction of such a body and the action upon it are precisely the riddles we desire, above all, to have solved. Monism is altogether incompatible with a world consisting of monads and it is time that this should be distinctly understood. Whoever adopts Monism of any kind has to drop indiscerptible personality for good. And whoever believes in spiritual personality, divine or human, can never consistently become a monist. Spiritual persons of an anthropomorphic constitution are, in truth, what Professor Hæckel so characteristically calls them, "gaseous vertebrates," a type of being so well known among us that our many spiritualistic fellow citizens find no difficulty whatever of visibly realizing any desired number of specimens.

Kant, like Descartes, formed a starting point and nucleus for various monistic speculations. For, though he had centralized the faculties of the understanding in the synthetical unity of apperception, an all-combining power emanating from the intelligible world, and constituting our intelligible Ego, he left within our mental constitution unconnected the different categories and the two forms of sense-presentation. He left also completely in the dark the way in which the things-in-themselves affect through our senses our general sensibility, though such affection was the only evidence he had of the existence of such things-in-themselves. Lastly, besides our world of experience within time and space, and besides the world of things-in-themselves inferred from sense-affection, he assumed also an intelligible world, the veritable home of the supreme intelligence and of our own innermost being. The nearest approach he himself ever made toward Monism consisted in the suggestion, that possibly the reality peripherically affecting our sensibility may be the same reality which centrally constitutes the intelligible world.

On the uncertainty of things-in-themselves, Fichte soon-constructed his Monism of the almighty Ego. As we cannot possibly know from experience through what kind of influence our perceptions arise, why may they not altogether originate through some intrinsic activity? Had not Kant shown that such an intrinsic activity, endowed with free causation, constitutes the moral kernel of our being. And, indeed, our productive imagination is quite equal to bring forth the world. Is not the world, representing spectacle displaying itself in dreams, undeniably the exclusive creation of that

intrinsic faculty? It stands to reason, then, that it is the originating act of the Ego itself that creates the world we know—the world which is thus, in fact, only the expression of the vivifying self-movement of productive thought. This view, not quite absolute yet, may be called the Monism of subjective idealism or of self-acting thought.

In the course of time moral considerations, which were really grandly predominant in Fichte, induced him theoretically to admit the existence of fellow creatures, that is, the existence of ever so many other world-creating Egos. And to explain how the productive imaginations of the sundry Egos are actually realizing, not each a different world, but only a different aspect of one and the same world; to solve this very ancient riddle, he simply assumed a unitary power present in them all and directing their thought in harmony with an all-comprehensive plan.

Such an amplification reduces, however, the monistic system virtually to a monadology, which we have seen can never become monistic.

THE TWO HEMISPHERES.

BY B. W. BALL.

In the present cosmopolitan condition of the civilized world the two hemispheres are such close neighbors that they are daily and hourly interchanging gossip. Henry Ward Beecher in his latest lecture dwells complacently on the contrast between Europe and this great continent of America in the fact that while Europe presents the aspect of a regular field of Mars and bristles with the bayonets of standing armies, this continental country is held in subjection by 15,000 soldiers all told. While this is a gratifying fact to us dwellers of the New World, we know very well that if this continent of North America was as populous as Europe and was occupied by a number of great nationalities speaking different languages and actuated by immemorial rivalries and hostile tendencies and traditions, to say nothing of differences of race and creed, it would, like Europe, doubtless present the spectacle of vast standing armies ready at a moment's warning to become belligerents. For why should not like causes and conditions produce like effects here as elsewhere? But fortunately for the peace of this hemisphere we are the only great nationality in it. We are America in fact and when the word America is used it is understood to mean the United States, which are a new-world community in their entire social and political organization. Our neighbors are not at all formidable in a military sense and all of them combined would be no match for us. Thus we are not under the necessity of living in an armed state.

We are wholly outside of the European group of nations, not more isolated from them physically by an intervening ocean than we are socially and politically by

our unprecedented institutions. Our relations with European states are almost wholly commercial, so that consuls are alone needed to take care of our foreign interests. It is true that there are American ministers resident at the various European courts, but they are rather gentlemen of leisure, seeing Europe at the expense of the federal treasury, than actual diplomatists. Such appointments are rather the rewards of political partisanship than serious ones meaning business. This great continent or America is even now largely a wilderness, wild nature being in the ascendant over most of its surface still. It probably does not contain a population of a hundred millions all told, while Europe territorially its inferior, contains certainly three or four hundred millions, more or less, of men of different races, languages and religions, ranging all the way from Englishmen and Frenchmen, in the northwest, to Slavs, Turks and Greeks, in the southeast. Man here is not yet a weed, as he is in crowded Europe. We are thus, by reason of our isolation and favorable environment and the continental roominess which our fifty or sixty millions of population enjoy, a pacific community attending to business and party politics principally. But if there were rival social systems here and race hostilities and if the old and the new stood face to face here as they do in Europe, we should probably exhibit a European belligerency and preparation for conflict. Our late civil war showed that we can throw ourselves into war as furiously as we do into business pursuits and money-making. Only a war here means necessarily a civil war, because we must fight each other when we fight for want of outside foemen worthy of our steel. Of course our little standing army is a mere frontier police. It does not hold anybody in subjection at all, except possibly a few Indians. An English writer who has recently been making the tour of this great continental country, says, in his account of it, partly in joke and partly in earnest, that "in a few generations the whole earth will be one big, dead-level America, as like as two peas from end to end, and dressed in the same stereotyped black coat and round felt hat, enjoying a single, uniform civilization." Doubtless the cosmopolitan civilization of to-day tends to uniformity social and political and to a uniformity of dress, language, ideas and modes. But the uniformity of European and American civilization never will take the form of a dull, unvarying Chinese stationariness presenting just the same unchanging aspect from century to century. It will be a uniformity of movement and progress attaining to ever new plans of elevation and amelioration. Our institutions being most in accord with reason and common sense are likely to become universal. De Tocqueville, over half a century ago, came hither to study the workings of popular government, because he saw that the Old World was moving in a democratic direction.

Europe, though the smallest of the continents, yet, by reason of the vastness of its sea-coast and its interpenetration by midland seas, is in all respects the most powerful. In fact, it has been and is the focus and radiating center of civilization. But its nationalities present this anomaly, that while their upper classes and intellectual circles are the very high water-mark of humanity, its lower orders or masses are left in a state of semi-barbarism, as we know in our large cities to our cost. For the stream of proletarian immigration from abroad begins to be a menace to popular government in our great centers of population. As I have said, Europe being the continent that dominates all the rest, until the European nations disarm, war will continue to be more or less the normal state of mankind, as Hobbes insisted that it was.

We are told that it is a period of the reign of force in Europe emphatically at the present time. Each of the great European powers is armed *cap-a-pie*, because the rest are. Germany, the foremost of the European group of nations since 1870, owes her leadership to the fact that she has been and is disciplined for war as no other nation is. In fact, the traditions of Prussia, the central state of the German Empire, are all martial. She was created by the sword of her great warrior-king, Frederick, who fought nearly all the continental nations for years single-handed to make his country the nation that she is. Germany is compelled by her position, political and geographical, both, flanked as she is on the one hand by France and on the other by Russia, to be armed to the teeth. Semi-barbaric Russia, with her vast population wielded by a single despot, whose whim is law, and with her traditional gravitation toward Constantinople, is a constant menace to all the states of western Europe. Since her humiliation in 1870, France has put herself in such a state of military preparedness as she was never in before, even in the palmy days of Napoleon I. She is impregably fortified on her northeastern frontier, where she suffered such ignominious defeat, so that a German army can only invade her a second time by way of Belgium. Her military force is counted by millions. Of the three military empires of Europe, Austria is the weakest and it is said that without the backing of Germany she would be no match for Russia, in case of a war with that power. But Bismarck is anxious to keep the peace with Russia, as long as there is a probability of another conflict with France. As for Great Britain, she does not pretend to be a land-power in the sense in which Germany, Russia and France are. Furthermore, she is not merely a European power but a sort of cosmopolitan empire, extending round the whole globe. She is never in readiness for war at short notice, as the great continental powers are, because "the silver streak" makes invasion of her difficult. But her vast wealth and unlimited mechanical

means of arming herself by sea and land are such as to make her an invincible adversary in the long run, when she is fairly in for a serious struggle. As for Italy, since her unification and the reduction of the Pope to the civil level of an ordinary subject, she must be classed with the great European powers. As for Spain, Denmark and Sweden, they are of as little military account as Belgium. Thus is the continent of Europe, near the close of this nineteenth century, an armed camp throughout or, in the language of Plutarch, "an orchestra of Mars," its chief nationalities relying solely upon a display of force to maintain their rank and prestige. When we take into account the current enginery and terrible instruments of destruction and havoc which are employed in the battles of the present day, the historic periods most noted for violence and bloodshed in the matter of warlike capability sink into insignificance when compared with the present.

Europe has everywhere a redundant population straitened for room and for means of subsistence. In view of this fact, it would seem that it would be wiser, as it certainly would be more humane, to expend the enormous sums which are necessary to support her standing armies in transporting her superfluous myriads to wilderness regions of the earth, to the fertile solitudes of the dark continent, for such a disposition of them would increase the area of civilization and a civilized occupancy. Of course, military discipline is not without its advantages. It is a promoter of manliness and of the spirit of order and subordination without which society would be disintegrated, as it is likely to be here if things go on as they are going now. Prussia, the foremost nation of Europe in the intelligence and high average of its population, has been under a strict military discipline from the days of the father of Frederick the Great down to the regime of Bismarck and Von Moltke.

A nation may be demoralized and debased by an excessive devotion to the sordid pursuits of peace, such as gambling in stocks, political log-rolling and a too eager chase after lucre. Thus far no nation has been recognized as great and formidable which has not been first-class in the matter of force, whether for purposes of aggression or defense. The lion and the eagle have been thus far the favorite emblems of national power and greatness. It was not the philosophy of Kant, or the poetry of Goethe and Scheller, or the science of Humboldt, which gave to Germany the leadership of the European group of nations and brought her suddenly to the front in continental politics, but the invincible legions and victories of Kaiser Wilhelm, Bismarck and Von Moltke won against Austria and France at Sadowa and Sedan. These exhibitions of martial power changed the opinion of the nations of both hemispheres at once in regard to Germany, whose people had been previously

regarded as impracticable dreamers. Now the German language has everywhere superseded the French as a necessary study by those who would obtain a liberal education.

It was Germany's display of overwhelming military power which called the world's attention to the fact of her intellectual supremacy. Generally the strongest nations are the foremost in every respect. When Greece could boast of an Alexander the Great, the conqueror of Asia, she could at the same time show one equally great in the intellectual order, viz.: his tutor, Aristotle.

The nations of Europe have not only been able to conquer, colonize and hold in subjection the outside world, with its barbaric continents and isles, but they have also produced the noblest poetry and reflective thought, while science and civilization, in its highest sense, are European. We are an outpost and projection of Europe toward the sunset, but greatly modified in figure and feature and intonation and inflection of voice by nearly three centuries of new-world inhabitancy. Thus have the most virile and martial of races and nations been also the most intellectual.

ETHNOLOGICAL STUDIES.

BY THEODORE STANTON.

One of most interesting books in the department of sociology that has recently appeared here is M. Elie Reclus's *Les Primitifs*. The author belongs to that distinguished French family, all of whose members seem to be devoted to some literary or scientific work. The best known of the Recluses is Elisée, the famous geographer and ardent socialist. Elie, whom I have just mentioned, is the elder brother of Elisée and, if he does not enjoy such a wide-spread reputation, is a man of no ordinary parts. Another brother, Onésime, has published books of travel, while a fourth, Armand, an engineer by profession, has associated his name with the Panama canal, about which enterprise he has printed several reports and pamphlets. A fifth brother, Paul, is one of the ablest Paris surgeons. The three sisters of these remarkable brothers have published translations, novels and scientific studies. A cousin, Mme. Pauline Kergomard, *née* Reclus, is an authority in France on the education of children and has written largely on pedagogic subjects. I do not know whether I have exhausted the list of the notable members of this famous family, but I have said enough to show you that it is worthy of Galton's attention. But, perhaps, the most interesting fact for us, at least in connection with the Recluses, is that all of them—I think there is no exception—are outspoken free-thinkers.

A friend gives me the following account of M. Elie Reclus's last volume, mentioned at the beginning of this letter: "The work," we are told, "is a study in

comparative ethnology, the first in a projected series, and is to be supplemented by another volume if this one is favorably received. The present studies are five in number, and one chosen in extremes of latitude, thus offering a diversity of customs and manners peculiarly interesting. One is astonished to find, in regions so remote from what we are pleased to call civilization, features of life so strikingly indicative of the social as well as the generic unity of the human family. The hyperborean amid his eternal snows and ices, dominated by a bleak monotonous nature, is as tenacious of his claim to manhood as is the most polished metropolitan. It is remarkable that these benighted races of the western hemisphere, commonly called Esquimaux, or eaters of raw flesh, invariably distinguish themselves from the rest of humanity by the name of *quoit*, which signifies man. M. Reclus divides them into two peoples—the oriental and the occidental, the Tadits of Greenland and the Tadits of Alaska. While his graphic pictures of their family and community life reveal to us a far from civilized state of existence, yet we are bound to recognize here and there striking resemblances to familiar institutions.

“Such discoveries rather detract from our boasted superiority and, from an evolutionary point of view, they are profoundly significant. They show us, as above remarked, the oneness of mankind and lead us to consider in a new light the complex fabric called modern civilization. A just pride in the gigantic achievements of the scientific world disposes us to exaggerate the merits of a society whose every institution, after all, is but a medieval heritage. Such books as M. Reclus’s are calculated to awaken healthful reflections on this point and to call attention to imperfections nearer home.

“But the crude, discordant side of primitive life is not all that is given in these studies. A chapter on the *Nairs*, or warrior nobility, on the coast of Malabar, reads like a romance. It is a people dominated by the feminine principle. Hereditary descent is on the side of the mother, the priestess of the household, whose prime minister is the eldest daughter, and in whose presence her sons never sit without invitation. Of this marvelous race, called prehistoric, but a fragment remains. They are hedged about by a new and unsympathetic civilization with which they refuse to mingle, preserving with singular tenacity their antique customs and a proud individuality that is the admiration of all who come in contact with them. A traveler, at the beginning of the seventeenth century, describes them as a splendid people. ‘The *Nairs* of the antique type,’ he says, ‘unite the martial boldness of the Spartan with the grace and gallantry of the middle age chevalier. Every *Nair* is a lord in his country, living upon his revenues or on a pension conferred by the king. They are the best formed, the most gracefully-

proportioned and the handsomest people that I have ever seen and they make the finest soldiers in the world.’ But they fight only with their equals. A *Nair* would consider himself utterly disgraced should he cross arms with an inferior race. The women also are spoken of as nobly proportioned and beautiful in face. They wear but little clothing and prefer, as has been shown, to leave their native shores rather than submit to be costumed according to the requirements of a ‘more refined civilization.’

“It is very interesting as well as instructive to follow M. Reclus through all the complexities of his many-sided studies. It may fairly be said that ‘truth is stranger than fiction.’ Few brains would be able to weave an imaginary picture that could rival these real ones. And when we consider how intimately all these distinct phases of society, however obscure, are linked in with the philosophy of the great whole, we cannot too highly appreciate the author’s effort to introduce these remote peoples to modern progressive thought as subjects of serious study. In this work we see the infantile beginnings, the gropings of blind instinct of races without industry, art or science, the victims of helpless ignorance. We also see the strange, grotesque perversions of human nature under such abnormal circumstances.

“Thoroughly versed in the historical and sociological sciences, M. Reclus has gone into this work with a view not only to amuse the curiosity of his readers, but to aid in laying the foundation of exactness in those sciences which are of primary importance to humanity at the present day, as they are the condition of constructive social progress. We hope soon to see the second of the series, which will certainly be greeted with interest.”

Paris, December.

APHORISMS FROM THE STUDY.

BY XENOS CLARK.

The most exasperating thing about a foolish man is that he never perceives his own folly.

By a man’s opinion of death you may learn what he has done in life.

The chief objection to puns is the company they commonly keep.

The same knowledge that teaches us to criticize compels us to forgive.

Poetry is the sunrise of the mind.

The love of life in those whose life is lovely is so strong that it even can lead them to think the dread of life in those whose life is dreadful a needless illusion.

The difficulty of attaining good ends measures their stability when achieved.

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixon Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY.

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of *THE OPEN COURT* is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to *THE OPEN COURT* should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, FEBRUARY 17, 1887.

SALUTATORY.

A country like this, vast in extent, with resources undeveloped and with such a sparse population to the square mile, is not a country of a leisurely class of men devoted to purely intellectual pursuits, to the dissemination of ideas and the advancement of truth for its own sake. But absorbed as the people of this new country necessarily are in material, industrial interests, yet there are many who, in the intervals of business and exacting bread-and-butter pursuits, desire to keep themselves informed in regard to the best thought of the day. They know, in spite of the fact that professors and teachers of the old theologies still keep droning formulas and creeds which have ceased to live in the faith of reason, as though nothing had occurred to discredit them, that a radical change has come over the spirit of the world's dream; and although a people as prosperous as the American people must be more or less conservative in both religion and politics, whatever the established order

of things, temporal or spiritual, there is an increasing number who are hungry for ideas, for new truth, for the advanced thought of the time, who have ceased to believe in the traditions of the past, however hoary with years and authoritative they may be; who know that all the truths which enlighten mankind and advance civilization, are the acquisitions of experience and the revelations of reason, and that the canon of truth is by no means closed, but still open for ever new additions and amendments as the years roll away and the mind penetrates ever deeper the mystery of things.

Thus, while political and commercial journals with their news from all lands and their comments on current events reflecting the popular mind, and that portion of the press devoted to the old orthodoxies by whatever name they are called, are certain of a most liberal support, there is room, we trust, for a journal like *THE OPEN COURT*, which, recognizing an element of truth in all religious systems, will aim to distinguish between this and the errors with which the truth is encrusted and to give to rational religious thought a firm basis in science.

THE OPEN COURT will encourage freedom of thought untrammelled by the authority of any alleged book-revelations or traditional beliefs, afford an opportunity in its columns for the independent discussion, by able thinkers, of all those great ethical, religious, social and philosophical problems the solution of which is now demanded by the practical needs of the hour with an urgency hitherto unknown, treat all such questions according to the scientific method and in the light of the fullest knowledge and the best thought of the day, advocate the complete secularization of the State, entire freedom in religion and exact justice for all, help substitute catholicity for bigotry, rational religious thought for theological dogmatism and humanitarianism for sectarianism, and, at the same time, emphasize the supreme importance of practical morality in all the relations of life and of making the well-being of the individual and of society the aim of all earnest thinking and reformatory effort.

While the critical work which is still needed in this transitional period will not be neglected, the most prominence will be given to the positive, affirmative side of radical liberal thought. Subjects of practical interest will have preference over questions of pure speculation, although the latter, with their fascination for many minds, which, as Lewis says, "the unequivocal failure of twenty centuries" has not sufficed to destroy, and the discussion of which is not without value, will by no means be wholly ignored.

THE OPEN COURT, while giving a fair hearing to representatives of the various schools and phases of thought, will be thoroughly independent editorially, asserting its own convictions with frankness and vigor. It will aim to be liberal in the broadest and best sense

and to merit the patronage of that large class of intelligent thinkers whom the creeds of the churches and the mere authority of names can no longer satisfy.

Bound by allegiance to no particular party or religious sect, this journal will sound a note of warning on occasion of any ecclesiastical encroachment upon American liberty, whether threatened by the powerful hierarchy whose head resides in Europe, where it is the undisguised enemy of popular freedom and popular education and whose assaults upon the free common school of America is as insidious as it is persistent, or by that restless pietism which aims to arrest liberal thought in its practical effect, by the revival of ecclesiastical laws in the professed interests of morality, and which, not satisfied with so much of the union of Church and State as still survives in this Republic, in existing anomalous statutes and established customs, is zealously working for additional legislation to secure the official recognition of theological dogmas by the National and State governments.

American liberty is by no means what it ought to be, even, so long as honest convictions anywhere within our bounds disqualify a man as a witness, or the property of ecclesiastical bodies is exempted from it just proportion of taxation, or theological teaching is included among the compulsory exercises of our public schools, or public money is appropriated for the endowment of sectarian institutions, or any class suffer legal disability of any kind on account of their religious opinions. While these evils remain, a journal devoted to equal and exact justice for all, irrespective of religious belief, cannot be without a mission.

THE OPEN COURT will aim to keep the banner of truth and reason waving above the distractions, party contentions, theological controversies and social and political crazes of the hour; to submit all opinions to the crucial test of reason and recall men from their aberrations to sanity and the pathway of truth.

To the American people, cosmopolitan in character and quick alike in opposition to wrong and sympathy with right, so far as they can recognize them, we confidently appeal, sure in the end of a favorable verdict from such a tribunal on the great questions which are to be tried in THE OPEN COURT.

Mr. Moncure D. Conway has kindly sent us for publication in the next issue of THE OPEN COURT his paper on "Unitarianism and its Grandchildren." This remarkable production, by one of America's most radical thinkers and brilliant writers, has been read before several eastern societies, and it has made a marked impression; but it has never been printed, having been reserved at our request for the columns of this new journal, whose readers may expect in the essay a rare intellectual treat.

In an article printed in *The Index*, entitled "The Incomplete," Professor W. D. Gunning, referring to the Plateau experiment, observed that its "analogue is the material universe," and he added that "no thoughtful man can witness the Plateau experiment without feeling that his mind may be standing at the very threshold of creation." The Plateau experiment has often been applied to typify the genesis of the solar system. It may be tried by anyone who has a delicate touch. Put alcohol into water until the mixture will hold olive oil in suspension. Fill a glass globe with this fluid and pour into it olive oil. The oil will diffuse itself through the fluid which will hold it as the heavens hold a nebula. Take a stiff wire and bend it at one end into a crank by which you can rotate it. Let the other end be smooth enough to turn freely in a socket, which must rest firmly on the bottom of the glass globe. Insert on the middle of the wire a little disc, jagged on the rim. Place this wire in the globe and rotate it. For delicate experiment the rotation should be accomplished by clock-work.

* * *

Col. John C. Bundy, editor of the *Religio-Philosophical Journal*, in a remarkably thoughtful paper on "The Country Press in Ethics," read before the Illinois Press Association a few days ago at its annual convention, said:

In the words of the immortal Lincoln ours is a "government of the people, by the people, for the people." Hence the purity, strength and permanence of our form of government and its benign influence upon the great family of nations rests upon the morals of the masses. And in turn the moral sense of the masses is to a considerable and steadily increasing degree due to the ethics taught by the country press. The cause of this increasing influence of the press in ethics is neither remote nor obscure. With increasing intelligence among the people, morals steadily tend toward a non-theological basis. A scientific foundation for ethics is rapidly becoming an imperative necessity, without which a moral interregnum impends. A regulative system based on theological dogmas has ceased to regulate with any great force. Old theology is moribund and with its decay dies its regulating power. It no longer is master of the public conscience; its foundations, built on the superstitions and idiosyncrasies of visionaries and ambitious men have given way and under its crumbling walls the influence of its moral code is fast disappearing. In the place of the supernatural, people seek a code of natural ethics. This will not be found in the average preacher's study, but it should and will in good time be reached through the editorial sanctum.

* * *

Prof. Ernst Haeckel states his "Monistic thought" as follows:

Scientific materialism, which is identical with our Monism, affirms in reality no more than that everything in the world goes on naturally—that every effect has its cause and every cause its effect. It therefore assigns to causal law—that is, the law of a necessary connection between cause and effect—its place over the entire series of phenomena that can be known.

* * * * *

In order, then, to avoid in future the usual confusion of this utterly objectionable Moral Materialism with our Scientific Materialism, we think it necessary to call the latter either Monism or

Realism. The principle of this Monism is the same as what Kant terms "the principle of Mechanism" and of which he expressly asserts *that without it there can be no natural science at all*. This principle is quite inseparable from our Non-miraculous History of Creation and characterizes it as opposed to the teleological belief in the miracle of a Supernatural.—*The History of Creation, vol. 1, p. 37*.

Strictly, however, our "Monism" might as accurately or as inaccurately be called Spiritualism or Materialism. The real materialistic philosophy asserts that the vital phenomena of motion, like all other phenomena of motion, are effects or products of matter. The other, opposite extreme spiritualistic philosophy, asserts, on the contrary, that matter is the product of motive force and that all material forms are produced by free forces entirely independent of matter itself. Thus, according to the materialistic conception of the universe, matter or substance precedes motion or active force. According to the spiritualistic conception of the universe, on the contrary, active force or motion precedes matter. Both views are dualistic and we hold them both to be equally false. A contrast to both views is presented in the *Monistic* philosophy, which can as little believe in force without matter as in matter without force.—*The Evolution of Man, vol. 2, p. 456*.

Monism and Dualism—Unitary philosophy or Monism, is neither extremely materialistic nor extremely spiritualistic, but resembles rather a union and combination of these opposed principles, in that it conceives all nature as one whole and nowhere recognizes any but mechanical causes. Binary philosophy, on the other hand, or Dualism, regards nature and spirit, matter and force, inorganic and organic nature, as distinct and independent existences.—*Haeckel's Ibid, vol. 2, p. 461*.

With many the word Agnostic means simply one who neither affirms nor denies the existence of a personal, intelligent Deity; one who feels that the data he possesses are insufficient to warrant affirmation or denial in regard to the matter. To this class evidently belonged Mr. Darwin. In one of his letters published since his death, he wrote:

I am, indeed, asked to attach a certain amount of weight to the judgment of the large number of intelligent men who have implicitly believed in God, but here again I see what an insufficient kind of proof this is. The safest conclusion seems to be that the whole subject lies beyond the range of human understanding. And yet a man can do his duty.

In another letter (to John Fordyce) Mr. Darwin wrote:

Moreover, whether man deserves to be called a Theist depends upon the definition of the term, which is much too large a subject for a note. * * * I think that generally (and more and more as I grow older), but not always, that an Agnostic would be the more correct description of my state of mind.

But of all the definitions and statements of Agnosticism, those of Prof. Huxley are, perhaps, the most important, for he brought the word into use. In 1884 he wrote:

Some twenty years ago, or thereabouts, I invented the word "Agnostic" to denote people who, like myself, confess themselves to be hopelessly ignorant concerning a variety of matters, about which metaphysicians and theologians, both orthodox and heterodox, dogmatize with the utmost confidence; and it has been a source of some amusement to me to watch the gradual acceptance of the term and its correlate, Agnosticism. * * * Thus it will be seen that I have a sort of patent right in "Agnostic." It is my

trade mark and I am entitled to say that I can state authentically what was originally meant by Agnosticism. Agnosticism is the essence of science, whether ancient or modern. It simply means that a man shall not say he knows or believes that which he has no scientific grounds for professing to know or believe. * * * I have no doubt that scientific criticism will prove destructive to the forms of supernaturalism which enter into the constitution of existing religions. On trial of any so-called miracle, the verdict of science is "not proven." But Agnosticism will not forget that existence, motion and law-abiding operation in nature are more stupendous miracles than any recounted by the mythologies and that there may be things, not only in the heavens and earth, but beyond the intelligible universe, which "are not dreamt of in our philosophy." The theological "gnosis" would have us believe that the world is a conjurer's house; the anti-theological "gnosis" talks as if it were a "dirt-pie" made by two blind children, Law and Force. Agnosticism simply says that we know nothing of what may be beyond phenomena.

Count Goblet d'Alviella, in his "Contemporary Evolution of Religious Thought," refers to "Monistic solutions in which mind is looked upon as the property or manifestation of matter (Materialism); where matter is made the outcome of mind (Spiritualism), or, in the third place, when mind and matter are taken to be the opposite of one and the same mysterious reality (Monism proper)."

Haeckel wrote in 1884:

I believe that my Monistic convictions agree in all essential points with that natural philosophy which in England is represented as Agnosticism. * * * I also believe that the Monistic natural religion will slowly and gradually, but surely and steadily, supplant the supernatural ecclesiastical religions, at least in the consciousness of the educated classes.

G. H. Lewes wrote as follows:

It may be noted that Metaphysics, refusing to adopt the Methods of Science, has received the protection of Theology, but only such protection as is accorded to a vassal, and which is changed into hostility whenever their conclusions clash, or whenever argument threatens to disturb the secular slumber of dogma. Treated as a vassal by Theology, it is treated by Science as a visionary. Is there no escape from this equivocal position.

Says Prof. Huxley in *Lay Sermons*: "The improver of natural knowledge absolutely refuses to acknowledge authority as such. For him, scepticism is the highest of duties; blind faith the one unpardonable sin. And it cannot be otherwise, for every great advance in natural knowledge has involved the absolute rejection of authority, the cherishing of the keenest scepticism, the annihilation of the spirit of blind faith; and the most ardent votary of science holds his firmest convictions, not because the man he most venerates holds them, not because their verity is testified by portents and wonders, but because his experience teaches him that, whenever he chooses to bring these convictions in contact with their primary source, nature, whenever he thinks fit to test them by appealing to experiment and to observation, nature will confirm them. The man of science has learned to believe in justification; not by faith, but by verification."

THE BASIS OF ETHICS.

A PAPER (SOMEWHAT REVISED AND WITH A FEW ADDITIONS)
READ BEFORE THE SOCIETY FOR ETHICAL CULTURE
OF CHICAGO JANUARY 14, 1887.*

BY EDWARD C. HEGELER.

*Fellow Members of the Society for Ethical Culture—
Ladies and Gentlemen:*

We are associated here as a society for ethical culture, so it behooves us above all to be clear and definite as to what is the basis of ethics or *what is good and bad*.

Let us now consider some examples of the use of the word "good." What is good for a clock? If it is protected from being broken; if it is kept well oiled; if it is so altered that it keeps more correct time—all this is called good for the clock, irrespective of any benefit the owner may have from it, but looking upon it exclusively as a mechanism. What is "good" in this case? It is the preservation of the clock from destruction, sudden or slow; it is an increase of that specific quality which is the special feature of the clock—that of keeping time.

What is good for the sparrow? I mean the sparrow tribe. If it has plenty to eat; if the weather is mild; if there are no birds of prey that may kill it; if there are no other animals that will eat the always limited amount of food upon which its existence depends; if the strength and intelligence of the sparrow tribe increase, so as to better endure the hardships of its struggle for life and a living; if it takes good care of its young so that they all reach maturity—what is the good in these cases for the sparrow tribe? It is its preservation from destruction; its growth; the strengthening of its powers of self-preservation; but, especially, the increase of its intelligence. To the sparrow tribe the various circumstances tending to its preservation are accompanied by sensations of pleasure; those tending to its destruction are generally, though not always, accompanied by pain. When we speak of what is good for the sparrow tribe, we think of pleasures and pains only as a secondary consideration.

What do we call good for men? In the first place all that we found to be good for the sparrow, with the same general conclusion: That good, for man, is his preservation or growth—bad, his destruction or decline.

What do we call good for our child? Firstly, we assume that whatever causes pleasure is also beneficial to it; that whatever causes pain, is in some way hurtful to it. We use here the words "beneficial to it." Does that not mean again "what preserves it and makes it grow?" We all agree, I think, that we call good for our child (without thinking of its pleasure or pain now

or later) that which makes it grow bodily and mentally. We deem good for it all that will make it equal to or greater than ourselves.

I find it necessary to give some explanations here which may at first appear to be outside of the scope of this discussion.*

What I think a conception to be: If a child sees an apple for the first time, the lens of the eye will throw a photograph of it on the retina, which photograph, as we now know, is fixed there for a short time, in a similar way as in a photographer's camera. From this photograph, through nerve-fibers, an analogue of the photograph is assumed to be brought to the gray matter of the child's brain, making a record there upon living, feeling matter; this has received the name photogram—in this case the photogram of an apple.

We may assume that at the same time the child first sees the apple it also tastes and smells and eats the same. Through the tongue and connecting nerves a record of its taste upon living, feeling matter is produced in the gray matter of the child's brain simultaneously with the photogram. So it is with the odor of the apple through the nose and the nerves connecting it with the gray matter of the brain; and so, also, living records of the several motions and sensations in eating the apple are simultaneously made on the child's brain. The gray matter of the brain lies on the surface thereof and is recognized as the seat of conceptions and ideas. It consists of hundreds of millions of brain cells, which again are little oblong globes of living protoplasm. The gray matter is underlaid by the white matter, which consists of innumerable nerve-fibers connecting the various parts of the gray matter in all directions between its parts and with the various organs of the body. The cells of the gray matter bearing the photogram or sight-record and those cells bearing the taste-record of the apple being in a conscious or active state with increased blood circulation at the same time, it suggests itself that the connecting white nerve-fibers are especially stimulated thereby to an increased blood circulation and growth. If later, of the photogram and taste-gram, the one is stimulated to consciousness by excitation through the eye or tongue, the other is stimulated to partial consciousness through the connecting white nerve-fibers without external excitation.

So if the child sees the apple again at another time, it is the living, feeling photogram of an apple resulting from its first sight, which is stimulated thereby and feels, or, as we say, becomes conscious of the apple. This photogram is the *ego*, for the instant; it has been asleep until the newly-formed photogram of the apple awakens it—that is, brings it into a state of consciousness.

*I wish to acknowledge my indebtedness to Messrs. Ernst Prussing, W. M. Salter, B. F. Underwood and my daughter Mary for assistance in giving my ideas literary form, the latter also for assistance in originally preparing the paper.

* I bring forward here, I believe, substantially the views of the great French psychological investigator, Th. Ribot.

For further explanation, let me state that instead of one photograph and one photogram being formed by the first sight of the apple, a very large number of similar photograms is formed. The apple must be presumed to be moving when the child sees it; the child changes its position when it looks at the apple. This explains more easily, too, how the photograms produced by the second sight of the apple find the photograms produced by the first sight.

The photogram of the apple will excite the memory or living record made by the taste of the apple. This will enter into partial consciousness without a new excitation coming through the tongue and in a similar way hundreds of other living records or memories will be partially excited indirectly. This combination of living records makes the conception of an apple.

An idea I deem to be a combination of conceptions and, therefore, to be embodied in the form of very complicated combinations of living, feeling organisms in our brains.

Now, what is good for ideas, or rather for the organisms, the forms of which are the ideas? It is their preservation, their gaining strength, their growth, the increase of their combinations with other idea-organisms and the increased control over them.

The organized whole or society of our living ideas constitutes our soul.

What has been stated as good for an idea is also good for their organized society, the soul, to wit: Preservation and evolution of its activities and sensations, especially their form.

Of the *reality* (that is the whole) we observe, *matter** is an abstraction; *energy* is an abstraction; *life* is an abstraction; *feeling* is an abstraction, and *form* is, to us, the most important abstraction.

The following has been given to me by our fellow member, Mr. Alexander S. Bradley, as Herbert Spencer's theory of the basis of ethics: "All conduct conceived of as good is such as must necessarily tend to happiness. You cannot imagine any conduct conceived as good which would tend to unhappiness. That is the ultimate standard of right and wrong, what conduces to the happiness of the human race in the true sense of the word." Upon my remark: "Then the good conduct of an individual may result in unhappiness to himself individually?" Mr. Bradley continued: "Proximate pleasures and pains are to be disregarded in consideration of remote results, in the same way as we take disagreeable medicine or have a leg amputated because we anticipate a greater amount of happiness as the result."

I answered him: "I will illustrate my idea of what is good by an example from the animal kingdom. A favorite dog of mine attacked a hen with a brood of chickens. The hen, although by far the weaker animal,

re-attacked the assailant and pursued it, risking even death or long misery from wounds as a consequence of her action, and bravely drove off the enemy. This act of the hen to protect her young, regardless of her own safety, we all, I think, call good."

Mr. Bradley replied: "I think your example does not conflict with the view of Spencer. The happiness that all beings feel in the love to their offspring has become a permanent quality of animal nature by inheritance and development. Acts conducive to the happiness of the offspring are acts conducive to the happiness of the parent. These acts are undertaken instinctively, impulsively, without thought of consequences, but they are more or less the acts tending to the happiness of individuals. The fear of proximate pain from the dog was overmastered by the impulse for acts conducive to the happiness of the hen tribe."

I said: "I think it is only the impulse of self-preservation—the hen viewing the young as part of herself."

Mr. Bradley: "Yes, but that instinct arose in the race from the experience of individual members that such acts produced a larger surplus of happiness than acts detrimental to self and offspring." (Here ends the dialogue.)

My opinion is that the self-sacrificing moral sense of the human mother for the protection of her child, as that of the hen for the protection of her chickens, is evolved by what Darwin calls "the survival of the fittest."

At first, in the hen tribe, an attack of a dog on the chickens would cause pain to the hen, and as a simple reflex action she would bite back, the same as she would if personally attacked. The idea of attachment to the chickens (which is a living organism in the brain) and simultaneous therewith that of her fighting talent (also such an organism) began to form, or if they already existed separately they combined. Their combination (in the white nerve-fibers) began to get stronger and a moral sense was formed, perhaps with certain members of the hen tribe in a higher degree than with others. As the hen tribe grew numerically stronger and the attacks of dogs were often repeated, such hens and their offspring survived in whom the above-mentioned organisms of ideas and their combination were most evolved. This process continued. In each hen the above-mentioned organisms of love and fighting talent and their combination was stimulated to growth by their use, so that they generally became stronger than the living organisms of the idea of fear. Moral sense became prominent in the society of idea-organisms. It preserved the tribe; and because of its power of preservation we call it "good."

Mr. Bradley has quoted Mr. Spencer as saying: "You cannot imagine any conduct conceived as good which would tend to unhappiness." My idea of this I

* I have this from my venerable friend, Professor K. Th. Bayrhammer.

will convey in an example. I think a physician may frequently be in the position of treating a critical patient so, that he will suffer pain up to his death for the purpose of attempting to save his life. Such life thereafter probably has an equal measure of happiness and unhappiness, so that the idea in saving it must be that ordinary human life itself is a great boon.

In revising this paper I introduce from Herbert Spencer's Data of Ethics the following:

"Among the best examples of absolutely right actions to be named, are those arising where the nature and the requirements have been molded to one another before social Evolution began. Consider the relation of a healthy mother to a healthy infant. Between the two there exists a mutual dependence which is a source of pleasure to both. In yielding its natural food to the child, the mother receives gratification, and to the child there comes the satisfaction of appetite—a satisfaction which accompanies furtherance of life, growth, and increasing enjoyment. Let the relation be suspended, and on both sides there is suffering. The mother experiences both bodily pain and mental pain; and the painful sensation borne by the child, brings as its results physical mischief and some damage to the emotional nature. Thus the act is one that is to both exclusively pleasurable, while abstention entails pain on both; and it is consequently of the kind we here call absolutely right."

Is not here the preservation of the human race, depending on such act, fundamental to the pleasure sensation?

In the education of children by their parents, which will be generally recognized as a moral proceeding, the society of ideas of the parents in respect to the later life of the child (which ideas are living organisms in their brains), are by their activity stimulated to growth, which growth is accompanied by pleasure sensations to them.

Experience of the parents in education will result in the formation of additional ideas, which will intimately unite with the society of ideas already in their brains. This also will bring with it, growth to the idea-organisms.

The sensations of pleasure of these idea-organisms are the pleasure in education; and as education is "good," are the pleasure in the "good." The action of this society of ideas ensures the preservation and the mental and physical advance of the family.

As by experience growing life is accompanied by pleasure sensations, that of civilized man (in his last evolved part, his brain) more so than that of the savage, and still more so than that of the animal; the thought of the further evolution of its form and its long continuance causes pleasure in us, that is, awakens in our brain the *memories* of pleasures actually experienced.

When deeming it the greatest good we can do for ourselves to work for immortality, which work is a pleasure in itself, we think of the pleasures (the rewards) it will bring us in the future, only as a second thought. If we think of such pleasures however, we may think of them as *further evolved from those we feel*.

A verse of a hymn (sung to a beautiful melody) to me and two comrades, about the age of fifteen, and which has been strongly refreshed in my memory, while studying this thought, describes them best. The verse is:

Was noch kein Auge sah,
Was noch kein Ohr vernahm,
Was je hienieden
Kein Menschenherz empfand:
Das hat Gott denen
Mit Huld beschieden,
Die bis ans Ende
Getren ihn lieben.

This course of thought has led us to the conviction that we cannot reach the basis of ethics without taking immortality into consideration. Examining Mr. Spencer's standpoint, that there must be a surplus of pleasure over pain to make life desirable, in the view, that ordinary healthy growing life is a pleasure in itself, we are also led to the thought, that the long lasting continuance of the most evolved form of human life, that is, immortality, is the important question in determining *what is good for man*.

If good be happiness only, then the higher degree, the more evolved form of happiness, is a greater good. But as all happiness has the factor of *time* as an essential element, its duration must be considered in determining its value. This consideration alone brings us to immortality, so that, whether we adhere to the happiness theory, or to the existence theory (meaning preservation and growth), if we will do good, do our duty, we must endeavor to learn about immortality all we possibly can. If some people are indifferent about this idea as far as they are personally concerned, they still should be concerned about it for the sake of their children and other relatives and friends, yes, and their people.

We owe this equally to our ancestors, going back to the first we can trace—those who lived millions of years before us. If *we* are here to-day, we owe it to our ancestors' long and successful work and struggle—to the always repeated self-sacrifice of mothers for their offspring. We owe it to them especially, to do our utmost, to preserve the greatest result of their work and struggle and suffering, the greatest result of evolution, namely, *the human soul*, and to help its further growth.

Think of the relation of a man to his own children. He can so educate them and provide for them that they may have as large a surplus of happiness in life as possible. This surplus may be reached at the expense of the duration of existence of his children or their offspring.

If I imagine a given territory occupied by two societies of equal strength in daily intercourse and intermingled with each other—one society believing that the surplus of happiness in life is the good, and the other that existence is the fundamental good—I feel certain that in the competition for existence, which is unavoidable, the former will gradually disappear from the scene, and the latter will eventually occupy the whole territory alone.

So I deem it of the greatest importance that we have as the leading member of the society of ideas, which is our soul,—as our *conscience* or leading *inner voice* (what it really is), this:

Preserve and evolve the human form of life, above all the human soul, regardless of pleasure or pain.

I think we all admit that so far the basis of ethics or the good has been a vague generalization of all generally accepted special cases of good. This offers an analogy to the "composite photograph" that Mr. Galton produces from many photographs, assumed to have something in common.

What we now call good, besides preservation, is that which we observe in nature and call *evolution*. To make a further definition, it is that process in nature, by which on our globe, from simple organisms, the plant, the animal, the savage man, the civilized man have been gradually developed, which process is now continuing, evolving the man of the future.*

Especially good I deem to be the evolution of form, through which thereafter, the same labor will produce a greater evolution than it did before.†

The process of evolution is an inherent, self-acting process. The continuance of evolution on our globe is the widest generalization of "good," at present, possible. So far we cannot do anything beyond our planet. Science gives us the conviction, however, that evolution is taking place throughout the universe—that God and the universe are one—are the *continuous ALL* of which man is a limited part and phenomenon.

When thinking of what is good or bad for man, of whom do we think? Honestly speaking, perhaps first of ourselves and, in this connection, not of our bodily but of our spiritual welfare. Though probably, in the first place, of our welfare in this life, still I am sure that nearly all of us are thinking in a vague manner of some kind of immortality, some kind of existence after death, as the thought naturally suggests itself that what is good in our present life will also be good for the future. I wish to lay great stress upon what I say here: This thought of a life after death is the most important feature of the "what is good for ourselves and those

who are dear to us" (even if we look upon immortality as a possibility only, not a probability) when we take the relative length of time of this life and that of the *beyond* into consideration.

What, then, is good for the beyond? I answer, whatever will make the beyond more certain to us and what will make us greater in the beyond. That is the real basis of ethics. I hear the protest: "But we do not and cannot know anything of the beyond." To this I must answer: That is an error; we can. Let us look first to a most simple living individual being, the *amœba*. It is a lump of protoplasm, which absorbs food and grows, then divides in two and makes two beings, like the parent being, only smaller at first; the latter absorb food, grow and divide again. There is no natural death among the *amœba*. Death can only result from want of food or forcible destruction. Immortality is the natural state.

And now let us look to man. Physiology shows us that our children are the continuance of our bodily existence, not of what we are to-day, but of what we were near the time they were born. Of what we were at that time, they are the continued existence, as much, if not more so, than we ourselves are to-day. The living, feeling so-called matter, which then lived and felt and thought in our form, has been replaced by other matter again and again. The form only is what has continued in us. In our children the form gradually developed; in us it commenced to decline.

A deeper insight into the nature of the soul is furnished by modern psychology; an erroneous conception of its individuality is destroyed, but its immortality is given back to us. The souls of posterity, it is shown, will be the further evolved souls of men of to-day—that is, the totality of the souls of the human beings of the future is evolved from the souls of the human beings of this day. Modern psychology has been called a psychology without a soul. This is a great error. Nothing but the bad, egoistical part of the soul-conception has been removed—that is, the permanent barrier between our soul and that of our fellow beings and also the permanent barrier between each of us and the great continuous *ALL*; the conviction is settled that we are but temporarily individualized parts thereof.

I have expressed, before, to the society my view, that it is a duty to hold firm to the conviction, that we can understand the nature of ethics. I will here quote from Goethe: "Man must hold firm to the belief that what appears incomprehensible to him is comprehensible, since otherwise he will not investigate." I will now say that I deem it of the utmost importance for us all, to convince ourselves, that the future of our souls, their preservation and evolution, lies in our posterity*; that

* This is substantially Herbert Spencer's definition of *evolution*.

† Prof. Ernst Mach points out that the nature of science is *labor-saving* in thinking.

*To impress this idea has been Gustav Freitag's life work.

is, however, only if we are good. Decline and annihilation, sooner or later, are the nature of the bad.

Preservation and evolution, then—that is immortality—of our soul, that is the true basis of ethics. What we value in us as our soul, what places us above the savage, is *form*. Gradually there has been evolved from the rude soul of our distant ancestors our soul of to-day—our present civilization—and we hope it will further evolve in our posterity.

Matter is indestructible, energy is indestructible, life is indestructible, though it can, apparently, be put to long rest, while form can be destroyed; but there is also no limit to its possible evolution. The capacity to evolve form again is indestructible, but to evolve the form of life which we name *the human soul*, that is the work and struggle of millions of years.

DISCUSSION OF MR. HEGELER'S ESSAY.

A stenographic report of the discussion which followed the reading of Mr. Hegeler's essay is given below:

REMARKS BY MR. PRUSSING:

In the views which Mr. Hegeler has expressed of matter and form in general, I believe I coincide, if I have correctly understood his meaning. As he wished to give the basis of ethics, in accordance with his views of the existing world (and, of course, we can only speak of ethics if we limit our province to our earth). I understood him to say that the basis of our ethics is the growth and preservation of the soul of mankind—perhaps I do not use his very words—preservation and development of the soul of mankind. He calls that immortality of the soul. It may be granted that there is a reason for using that expression, just as well as any similar one, as long as we mean by it that the soul of mankind, what he in another term expresses to be our civilization, has the nature of the immortal, as it will exist as long as mankind will itself exist: provided that it cannot go beyond the existence of mankind in its abode on this globe. If this is the sense of his meaning, I coincide with him fully. I believe that actually our faith and our belief that mankind will exist forever, as far as we are concerned or our children, is a great spur for our action. Nobody who is kind at heart can do without this spur. And as this has been the experience with all nations that have tried to step forward in the course of civilization, it has formed itself into the belief or creed of the immortality of the soul. If this belief has, in religions, taken a different form from that which Mr. Hegeler has depicted to us, it was perhaps what we would call superstition; and we have had to struggle hard with the consequences of such superstition; perhaps, for that reason, it may be advisable at present to use different terms for this idea. If you speak to a Christian or to a Mohammedan of the immortality of the soul, he will mean the immortality of his own personal inward being, his soul, that of the individual. He will connect with that idea an eternal life somewhere else, in heaven we will say, not on this earth. As this belief, as I have said before, has caused great harm to the world, to mankind on earth, I mean—sometimes it has called forth good actions, but I believe the balance is loaded down by the great woe it has given rise to in this world—as this belief, I say, has brought more evil into this world than good, we should be very careful in using such terms. Immortality of the soul, in the sense which Mr. Hegeler has used it, means nothing more than

“the good of mankind as long as it may exist on this globe.” With the destruction of mankind there can be no immortality of the soul any more, and, therefore, translated into plain English so that everybody can understand it, it means: We must work, if we want to act ethically, for the good of mankind, for those that live with and come after us. Of course we cannot benefit those that have gone before us, those that are dead. They have benefited us, and all we can do regarding them is to honor ourselves by revering them in a grateful mind.

Now, the question is whether we can reconcile this idea of an ethical basis with the views that Mr. Hegeler has given us of the work of nature. If I understand him correctly, he says preservation and growth, or development, is in itself “the good” for the world, and whatever is good for the world is the basis of ethics.

I cannot concede that. I have found cases of development in the world which have not served the good of mankind. Development is not always a right development. Mere growth is not always growth in a right direction. Mr. Hegeler says the fittest will survive. Yes, so they will, but the fittest for survival are not always the good, are not always the best. I do not take it that mere force, mere strength, which is actually the cause of surviving, must naturally be good, ethical, virtuous. I have a different basis for my ethics, although I say that development is a part of that basis, but not all of it. I consider development the means for the attainment of the real end or intention (if I can use that expression, although it is, perhaps, not well chosen); but let us say for the present that it is the intention of mankind to develop. I know that development gives pleasure and that it generally conduces to the well-being of mankind; but not every development, not development in every direction, leads to that end. Suppose that you want to acquire the properties of beauty: You will do it by developing your body in such forms as will be considered by the majority of the opposite sex, or by your own sex, or your tribe, as beautiful; gymnastics are a means for it, dancing another, etc. Instead of developing his body now in a harmonious way, suppose some man goes on to develop it until he converts himself into an athlete. He will be highly developed, but the beauty will be gone. He may astonish you, he may frighten you. He may enact tool-hardy things which will be called almost barbarous. He is so highly developed that it overreaches all beauty. Is the development in this case actually of great value? I can find no other basis of ethics than this: *Good is that which tends to the best interests of mankind, what will make mankind the happier in the very best sense of the word.* Do not take it to mean that every individual must be happy. On the contrary, a man may sacrifice his personal happiness, yea, even his life, in order to enjoy that happiness which makes him an ethical person; but if he does it, if he sacrifices his life for the good of society, for the good of mankind, all other considerations conducing to his own happiness are of trifling worth to him. The idea that he does act for the good of mankind, for posterity or for the present, for mankind in general, elevates him above all merely personal considerations. This is his principle; to act it out, his highest happiness, his dignity, his honor, the worthiest object of his life. I base my ethics on this idea that we must, under all circumstances, seek the best interests of mankind, irrespective of our personal happiness, and that the means to that end are development of body and soul, continuous growth, in short, what we call education. The education, then, of our children should be such as to teach them what is good for mankind; that those measures which we should employ, in order to lead an ethical life, are what we style virtues. They are not the end of our acting. They are the means employed by us in the same way as the architect or the builder will employ his square to lay it to the column with which he wants to support the building. Just in the same way we should act squarely, we should act right and true, because it is the means of producing

the greatest happiness of all mankind. As long as we have that view and keep it in our mind, we will never act wrongly. As soon as we leave that out of our consideration, we will be apt to act in our own personal interest. We would probably act selfishly instead of for the general good. So, then, what we call right is the employment of such means as will be approved and commended by every reasonable being; but the end and object of our acting is and always should be: The greatest happiness of mankind in general.

REMARKS BY MR. STERN:

I find it at all times exceedingly difficult for me, as a layman, and I apprehend it is the feeling of the majority, not only to discuss but to picture to my mind such abstractions as those to which the essayist of the evening has been treating us. Like the inexperienced swimmer on the shore, I try to cling to a life-line to avoid getting into deep water.

Now, we will all admit that the basis of ethics, the true basis of ethics, is the seeking and furthering of the good. Of course the question comes in what is good? Good is not an absolute thing. It is relative. Then it is the best we know. The essayist of the evening has given us one of the starting points by which to judge of the good, experience. Survival is the result of the experience of the past and the general tenor of the essayist's remarks tended that way. I admit the efficacy of that, but the potent force in the advancement of ethical good is the imagination, without which there is no ethical progress. Without the imagination there is no true ethics. I think that the essayist appreciates and knows it, but he did not touch upon it. That is the life-line, and the only one that I know of, that will keep us safe in any of these abstract subjects. It is only by projecting ourselves by aid of the imagination into an advanced moral state that we can gradually bring ourselves and humanity up to it. I see no other way. Experience alone teaches us only of the past. It is imagination which represents progress in ethics. The form of immortality of the soul that was shown to us here is a sort of sublimated pantheism. I recognize in it nothing else. How can we imagine such a state; how can we picture to ourselves such a state by the mere photograph that has been imprinted upon our minds from actual experience? By imagination we are projected beyond ourselves into that which might be and which we can attempt to follow. Taken in that view, I think that the constant search for the right, for that which is good, which tends to the survival of the fittest and the bettering of our conditions, is true ethical progress. Upon all other matters I think the essayist has only done justice to his subject. I mean this not as a criticism, but simply to supplement a point that I think the gentleman did not fully explain, and one which assists me at all events in forming a connecting link between his various ideas and give them, to my mind, an appreciable life and intensity.

REMARKS BY B. F. UNDERWOOD:

My calling here this evening was accidental and your kind invitation extended to me to participate in this interesting discussion, although highly appreciated, is quite unexpected; and the few remarks I can now make will add nothing to the value of the discussion. The essayist, and the speakers who have followed him, have spoken best, I think, in what they have affirmed. Mr. Hegeler's statement of his own position was stronger and more satisfactory than his criticism of Spencer's ethics, the main truth of which is that the ultimate test of morality is happiness. An act is right or wrong, as it benefits or injures mankind, as it augments or diminishes the sum total of human happiness. If the transcendentalist speaks of the "categorical imperative," and declares that "I ought," is more authoritative than any considerations of utility; still, in order to know what we ought to do, we have to go to experience and learn what has been promotive

of happiness. The whole history of civilization, from the dawn to the present time, is a record of experiences which have educated us into our present moral conceptions and emotions.

If you say that a moral act often involves suffering to the individual who performs it, the reply is that society is an organism, so to speak, of which individuals are but so many units, and since the well being, and even the existence, of the individual members depend upon the existence and security of the collective body, its interests become of primary importance and must be guarded, even though individual members suffer. Whatever, therefore, promotes the highest social interests is pronounced right. This is public utility, the general good.

But we do not always stop to consider a vast train of circumstances that must follow a given act. A large part of our moral life is lived without calculation, without deliberation. We have in us the organized experience of countless generations who preceded us, and who, having through ages acted in accordance with moral rules and principles, slowly learned by experience, have transmitted to civilized men of to-day the results, as a legacy, in the form of moral intuition. The moral sense, as it is called, thus evolved from the multiplied experience of men, has become a part of our mental constitution and may be as sensitive to a moral bruise as tactile sense is to the prick of a pin. The lowest creatures have no sight, no hearing, no taste. Their whole structure serves the general purpose of performing, without division of labor, the simple functions of life. Slowly life, as it is developed, differentiates into several senses,—taste, hearing, seeing, etc., with corresponding organs. Similarly there has been evolved out of experiences of men who originally could have made no ethical distinctions, the lofty moral conceptions of to-day. The race has learned by experience courses of conduct which are promotive of its well-being and, at the same time, it has acquired a moral sense, which intuitively responds to the distinctions which we have learned to make. This is Spencer's position briefly, and of course very imperfectly, stated.

REMARKS BY MR. ZIMMERMAN:

This subject is one that seems ever to be young and ever to be fresh and promises never to be settled. As many different individuals as there are, as many different opinions of what is right and what is wrong. What is right and what is wrong? What is good and what is bad? Those four words comprise the whole foundation of ethics; but, as has been remarked by all the speakers, I think, preceding, right and wrong are relative things, not absolute. Suppose that you transplanted an Ethiopian from the deserts of Africa into our city and gave him full swing, presenting him with some of our fine buildings, and tell him that he will be much happier here than in the desert, running about without any clothing, without any decent food, without any of the other luxuries that we have, would he be happy? There would not be a thing that he could enjoy of these luxuries that you have and enjoy so abundantly. That which he was brought up to he would much rather have than what you have got. So with right and wrong. Where do they originate? That is the vital question. My answer is with the beginning of life right and wrong originate. The *amœba* which Mr. Hegeler referred to, one of the lowest forms of animal life, is nothing more or less apparently than a mass of gelatine or some substance like that; it breaks in two and the two creatures, the parent and its offspring, turn and attempt to devour each other. You look on with your natural sympathies; you see them struggling, contending one against the other, one to overcome the other. Now, when you look at that you say there is a sense of right and wrong developed there and you cannot avoid a feeling that there is something going on which is the germ of right and wrong. The one that is devouring the other feels that it is doing right; the other that it is being wronged and,

therefore, the sense of right and wrong begins there. You feel this same idea up to the highest development of animal life, but it is the same thing. All life is a contention, a fight, a struggle. The inferior must ever give way to the superior. The one that has to give way is always the one that is wronged. The one that is successful does not see it in that light at all. Right and wrong are relative, not absolute, things. So, therefore, what is good and bad, in the same way, is relative, not absolute. What is good to one is bad to the other invariably.

As our time is so limited, I have brought a number of notes, but I will only read you one, which expresses my ideas very closely. It is from a law book on criminal law, from a class of lawyers who are regarded perhaps with a little aversion by ethical people; but this is the expression which the author substantially gives. I have modified and abbreviated it somewhat.

"In all nations and countries the highway of human progress is paved with the bones of its weaklings, which are cemented together with their blood. The strong tread down and trample out the feeble and, by ending them, diminish the average weakness of the race, while the survivors from this ever-raging conflict are those who are strongest and who are thus strengthened in both body and mind can transmit their acquired vigor to succeeding generations until the acquired vigor falls under opposition, when a decay sets in until the strong again become weak and are themselves overthrown."

This is virtually a synopsis of the world. You saw the Roman Empire, its rise, its flourish and its fall; the Grecian, the Egyptian, the Peruvian, the Mexican, in fact all nations of past histories have gone through just this process and it is ever going on.

CORRESPONDENCE.

LETTER FROM OUR JERUSALEM CORRESPONDENT —A REMARKABLE INTERVIEW.

To the Editor:

JERUSALEM, January 28, 1887.

Since midnight of the 7th of January this city has, as you know, been the scene of the most tumultuous and maniacal excitement, it is safe to say, that has been known among human-kind since in Noah's time the fountains of the great deep were broken up and hurled in all-engulfing inundation upon the distracted sons and daughters of Belial. Immediately preceding that terrible hour Jerusalem seemed to give fair promise of remaining forever in the semi-unconscious condition which has been its lot during so many centuries. The spirit of slumber seemed to pervade the place no less during sunshine than after dark. The motley inhabitants walked through the narrow and crooked streets of the ancient city as if they were the bodies of the saints which once arose in their grave clothes and came forth from their sepulchers and appeared to many. Scarcely even could it be said that in the market-places—where the sleepiest Jew or American generally is aroused into a semblance of animation—was there any interest manifested in the things of this world. The contingent of pilgrims that is always to be found in the Holy City had dwindled to a handful and even they were not of the enthusiastic kind. Jerusalem was in danger of passing from sleepiness to coma. Upon this lethargic city, with its drowsy people, suddenly was sprung the most tremendous seismic cataclysm of history, accompanied by phenomena which make it in the eyes of many the chief event in the career of the globe. The daily papers have given you full accounts of that awful diapason of world-discord, that hideous outburst of hell-music which aroused the slumbering city at the ushering in of the 7th of January and which awakened a third of the children and delicate women only to send them into convulsions and speedy

but merciful death. They have told you that when the paralyzed survivors succeeded in making their way to the doors and windows of their houses they were met by the appalling spectacle of an ocean of phosphorescent flame which surrounded their city on all sides, rising in enormous billows of light up and up till it reached the zenith and casting a brilliant but unearthly radiance over all objects in heaven and on earth; that in the clear space in the center of this well of flame, in the remotest heavens suddenly appeared a figure of dazzling splendor, begirt with iridescent garments and wearing a chaplet of diamonds "each one of which (in the language of a Chicago reporter then stopping at Jaffa and who came up to Jerusalem the next day) was estimated by a Jewish diamond broker to be worth at least as much as the Koh-i-noor." Circling about in mid-air, and slowly descending, this figure was soon recognized by a Second Adventist tourist from America—Abijah Higgins by name—who happened to be out for a promenade along the Via Dolorosa by moonlight, to be none other than the long-looked-for Messiah. Terror had up to this moment sealed the lips of the dumbfounded populace; but upon Abijah's rushing frantically through the streets yelling, "It's my Lord," the word was passed from mouth to mouth and in a short time the most hideous possible hullabaloo and confusion arose. The heterogeneous character of the city's population gave rise to the most various ebullitions of feeling. The Christians were, of course, exultant. Although there were not many of them who had believed with any vital faith in the doctrine of millenarianism, there was a more than Pentecostal conversion among them, and they ran about the city wildly crying, "Hallelujah! He's come! He's come!" And to the shrinking Jew or incredulous Mohammedan whom they met would be addressed the triumphant cry, "Didn't we tell you so?" The Jews were divided in opinion as to the nature of the phenomenon. Some said it was Elijah come again; others, that it was Jehovah himself come to sweep their persecutors from the face of the earth; others said that they were sore afraid that it was the Christians' God; others were simply nonplused and said they should wait till daylight before giving up all hope. The Mohammedans were at first convinced that the Prophet had made his visible appearance again, in order to carry on a crusade against the Giaours who are pressing the Ottoman Empire so hard; but upon observing that the person was unaccompanied by female attendants, they lost hope and joined their howls of despair to the Jews' wails. The luminous figure meanwhile descended toward that part of the city in which the Church of the Holy Sepulcher is located and when it was about a thousand feet from the earth a stentorian voice split the air, seeming to penetrate every nook and corner of the city, saying, "At last! At last! I am come to claim mine own. Tremble, O ye Gentiles! The day of your reckoning is at hand. I am he ye call Jesus." And the figure sank gently to the earth and disappeared within the precincts of the Holy Church.

All this happened three weeks ago. Since that time, what a prodigious change has come over this once sleepy town! All the world over the news went flying that the Lord had reappeared in Jerusalem and the most unparalleled excitement has ensued. From every point on the globe where the knowledge of Christianity has penetrated expeditions have been crowding in upon us. Asiatics, Africans, Europeans and Americans have swept in by the thousand and those now here are only the advance guard of the mighty host upon the way. From thirty thousand people within the walls Jerusalem's population has already swelled to near a million, within and immediately without the gates. From all over the world the telegraph brings accounts of the organizing by pastors and Sunday-school superintendents of excursions to the Holy Land to see the Lord, and the latest report is that the great transatlantic steamship companies have, at a special meeting

of their stockholders, resolved to withdraw their vessels from the British and American trade and carry passengers direct to the Holy Land, via the Mediterranean, if the craze continues. The question how to feed this great multitude of strangers is already causing some anxiety. Only yesterday there was a report that an aged Millerite from Maine had been found wandering about the plains outside the Zion gate in a semi-demented condition from lack of food. To-day a delegation of the leading citizens and most prominent visitors of the place called on the Lord at his temporary headquarters in the Church, with the request that he take into consideration the question of the physical sustenance of the great army of pilgrims. Upon his saying that he thought they ought to be able to manage the commissary department for themselves if he took charge of the army on field days, I am told the committee suggested that he might feed the multitude as he did before in another place. I am told that his reply was to the effect that the times had changed, that it was no longer necessary to perform that kind of miracle, and that during his present sojourn on earth he should utilize natural forces as far as possible, making use of supernatural expedients only as a last resort and mainly in the interest of missionary work among the infidels and heathen, which work would take up a large share of his time and energy during the next thousand years.

Much of the foregoing information has been communicated to you through the daily press. But you will remember that almost the first manifesto which the Lord issued to the world since his descent—a manifesto promulgated through the Archangel Michael on the morning of the 9th and published in the New York daily papers of the 10th inst.—was to the effect that he would see no newspaper men; that he had heard they always made mistakes in reporting conversation and that he was preparing an announcement which, when completed, would be given to the press. As, however, he expressed in the same manifesto his willingness to see other professional men, provided they were duly respectful—he had always admired humility—and did not ask for personal favors, I concluded that I would risk a call, knowing as I did that I should probably find him at leisure, as the awe of his followers is so great that they are afraid of close association with him, preferring to see him afar off, when he takes his daily walk along the Via Dolorosa for exercise.

As I had at the time of calling no intention of reporting the interview, I consider this report to be in no sense a violation of good faith. Furthermore, when I called I announced that I had "come upon an errand."

Going toward the Church of the Holy Sepulcher at about half-past ten yesterday morning, I found the edifice surrounded by an immense crowd and was obliged to obtain the services of a guard before I could get near the entrance. Having finally reached the church, I delivered my card to a very important looking functionary who stood at the portal, and, having looked me over rather contemptuously, I suppose on account of my modest raiment, he at last opened the door and told me to pass within. A lackey dressed in gorgeous ecclesiastical vestments bade me follow him and led me past the various chapels of the place, in which the warring sects of Christendom had been accommodated by the lordly Mohammedan rulers, and on an extemporized dais in the center of the church I beheld a man of magnificent physique, of kingly bearing and of a stern but thoughtful countenance, who was engaged in writing upon a parchment. Unaccustomed to regal pomp and ceremony and having in mind the meek and lowly Jesus of old, I was about to go up to the personage, offer my hand and announce the object of my visit, when the functionary at my side commanded me to bow three times to the earth and say, "All hail, King of heaven and earth." This done, I was permitted to advance to a low seat in front of the king, where I sat down and waited his pleasure.

Looking up from his writing, presently, the Lord saw me and immediately opened conversation. His voice was strong and resonant; he spoke rapidly, without gesticulation, and in forcible but not euphuistic English, a slight imperfection in his pronunciation of the *th* indicating that English was not his native tongue.

"I perceive that you are an American," he said. "I am always glad to meet persons from your country, although the pleasure is one which I do not often experience, owing to the heterodox opinions of most of your countrymen."

"Yes, Sir," I said, "it is true that but few of us have credited the predictions of your reappearance, but I trust that the holy and useful lives that have been led by many of our great men may have enabled them to find grace in your eyes. There are Washington, and Jefferson, and Emerson, and Longfellow—"

"My humble friend," interrupted the Lord, "the names you mention are indeed familiar to me, but I do not remember meeting the gentlemen to whom you refer. You must certainly know that mere morality is not sufficient to admit a soul to the sacred presence. I said of old, and I repeat it now, 'Unless a man believe, he shall be damned.'"

"But," I interjected, "I thought the learned doctors had decided that you meant to prefix a syllable to that word and change the vowel and make it read 'condemned.'"

"What I said I said," was the reply, "and I have no patience with the sickly effeminacy which would seek to change that good old English word damn into *damn* in order to please the granny school in the Church. God is God in all tongues and damn is damn. What would be the use of a hell unless there were damnation?"

Receiving no reply, he continued:

"Did I not say, emphatically, that I would come again, in power and great glory in the clouds of heaven, and that 'this generation should not pass away until all these things should be fulfilled?' I never heard that the worthies you speak of believed this word."

"They could not believe it, Sir, because they could not reconcile it with the fact that that generation to which you spoke had passed away without the fulfillment of the prediction," I ventured to interpose.

"Facts have nothing to do with the virtue of belief," was the reply. "They should have believed in spite of facts. Indeed, that statement was made simply as a shibboleth by which to sort out the sheep from the goats. The design was that each generation must take that asseveration to refer to itself and believe and act accordingly. How many in each generation since the other time have had this faith? Very few. They are the sheep. Your fellow-countryman, William Miller, was one of the greatest of these sheep. He was worth a dozen strait-laced Washingtons or pantheistic Emersons and great is to be his reward. In a few weeks, when my arrangements are completed for the resurrection of the just, I shall raise him first and appoint him Grand High Herald of the Kingdom."

"Sir," I asked, "do you mean by 'the resurrection of the just' those of righteous and honorable lives who have been upon the earth in times past?"

"By no means," was the reply. "That is a common misunderstanding of the phrase. By it I mean *just* those who have in the past believed that *this* (their) generation was to behold the second advent. The resurrection of all merely good men might overpopulate the earth. But we can easily accommodate all who have believed, at any given time, in the immediate advent of the Son of Man, so called. If the number proves greater than I expect—I have not made any very careful calculations; I leave all arithmetical work to my servant Daniel—we can easily hitch another planet to the earth and establish an overflow meeting of the saints, as it were."

"My Lord," said I, "would you object to giving to a poor man a brief outline of what you propose to do while you are here? It is a subject of great importance to me and my future movements will be largely controlled by any information you may vouchsafe."

The lord looked at me searchingly. "You're not one of those newspaper men in disguise, are you?" he said. "You don't intend to sell this news?"

"I have no such intention at present," I said, guardedly.

"Well, my humble servant," continued his omnipotence, "I may say that the first thing I shall do after issuing my pronouncement will be to apply the torch to various portions of the habitable globe. This in order that the Scripture may be fulfilled. 'The elements shall melt with fervent heat, the earth, also, and the works that are therein shall be burned up.'"

"But, Most Worthy Master," I remonstrated, "that will surely subject you to the reproach of being called an Anarchist and will besides cause a great deal of suffering and great loss of ecclesiastical and other precious property."

"I can't help that," was the reply. "It is necessary that there should be a general house-cleaning in this old world and fire is a great purifier. And the fulfillment of prophecy cannot be stayed by considerations of individual convenience."

"Following the great conflagration will come the first resurrection. This process will probably occupy several days, on account of the great care which the Recording Angel must exercise in determining just who are to be raised and in bringing the work well up to date. It would be very embarrassing, you know, if one of my subordinates should resurrect a man whom I should subsequently discover must be reinterred. The next thing to be done will be the remodeling and rebuilding of Jerusalem. My present quarters in this church are very unsatisfactory and not at all of the kind to which I have been accustomed. I must say that I like more majesty and grandeur and extension about my habitation," and the Lord gazed discontentedly about at the somewhat contracted area and tawdry decorations of the Church of the Holy Sepulcher. "You should see my official mansion in the City of God; no gilt work there—foundations and superstructure all of the genuine yellow metal, veneered with gems. I haven't time to mention all the particulars, but you can read all about the materials in Rev. xxi:18-21, for the palace is built to harmonize with the walls. I do not know but I shall bring the New Jerusalem down from home—perhaps it would be as easy as to try to make over this old nest of rookeries. But in some way I shall certainly establish quarters to which I shall not be ashamed to invite Pa and Parry."

"Next I propose to take in hand the infidels. I shall send out some of the resurrected Millerites and Chiliasts of all descriptions—men of gigantic intellects all of them—to convert the so-called scientists, and if they do not readily succumb to argument, I shall try other means of bringing them to their senses," and the Lord toyed significantly with an elaborately ornamented gold paper-knife, in the shape of a Turkish yataghan, which lay on his writing table. "Of late years these men have become very bold and I must give them a lesson. This is, indeed, the main reason for my advent at this time. A few years more and it would have been too late. There is one particularly blatant infidel in your country, one B—— I—— by name, who some years ago caused great travail of spirit to one of my most doughty lieutenants, T——*, of Brooklyn. I know all about it, for T—— gave us full particulars one morning in his prayer. I mean to have a personal interview with that fellow and if he doesn't come round very quickly, I—I'll have him bastinadoed."

*I suppress these names, not desiring to anticipate the Lord's work of warning or of reassurance.

"Most Potent Seignior," I here interjected, "there is at present in my country a controversy raging with respect to the future lot of the heathen who have not heard the 'glad tidings of great joy.' One party says that these heathen, inasmuch as they have not accepted the only Saviour, are doomed to hell. The other party says that as such heathen have not accepted Thee, because they never heard of Thee, it were unjust to punish them for their misfortune and that they will have a chance of knowing Thee in the future. What is the truth about this matter, O King?"

"About the heathen who are already dead," was the answer, "I cannot now speak. But those who are now alive and have not heard of me, will hear very shortly and with no uncertain sound. You remember the promise in the second Psalm, 'I shall give thee the heathen for thine inheritance: thou shalt break them with a rod of iron; thou shalt dash them in pieces like a potter's vessel.' That doesn't look as though we were going to err on the side of pusillanimity, does it? I purpose sending out very soon an immense army of my retainers to conquer the heathen and bring them before my throne and they will soon cease their troubling. At any rate, I am determined they shall all be baptized. Any who demur will be broken with a rod of iron, as promised. And death will not come to end their sufferings. Everybody has got to live a thousand years. Oh, we shall all be very happy."

"But it will be a big job to convert all the heathen and the infidels," I ventured to remark.

"Not after I bind Satan," was the reply. "The Devil is at the bottom of most of the antagonism to Us. He received a dreadful scaring the other night and fled to the uttermost parts of hell when I came down, and as he is an exceedingly crafty and fleet-footed personage, I suppose it will be some time before my servants take him. But as soon as he is safely bound and tumbled into the pit, our work will be much simpler."

"If no one is to die for a thousand years," I observed, "and marrying and giving in marriage are to continue, how will the world contain the vast population that will come upon it, in addition to the large number who are to be resurrected?"

"The population will not increase so rapidly as you think, my unsophisticated friend. You remember my servant Isaiah said that in the millennium 'the child shall die an hundred years old; that is, the child shall cease to be a child and become a man at that age. Now, if parents find that their children are to be dependent on them for a hundred years instead of a dozen, will not there be a positive check to increase of population? Think of the misery of nursing a lad of sixty through an attack of the measles, or listening to the wailings of a girl of thirty-five in the agonies of teething! The birth-rate of the world will greatly diminish as a result of this wise provision."

"Then the Talmudian calculation that in the millennium each Israelite will have sixty thousand children, or as many as the total number of the Israelites who went out from Egypt, is incorrect?"

"Obviously."

"The Sibylline books declare that in the millennium there will be no more seas, no more winters, no more nights; that everlasting wells will run honey, milk and wine. Is this prophecy correct?"

"I do not think we can escape the obligation of drying up the sea. Rev. 21:1 says plainly, 'There shall be no more sea,' so we shall have to get rid of the ocean in some way. Probably we will turn it into fire at the time of the universal conflagration. But the other predictions were only the vagaries of a distempered intellect, as was also the prediction that during the millennium men would be, as before the fall, two hundred yards high."

"How, may I ask," said I, "do you reconcile the promise of your universal and triumphant reign during the millennium with

the statement in Revelation that at the end of the thousand years the nations of the earth shall, under the leadership of the liberated Satan, attack the saints in their stronghold?"

"Now, now, my good fellow," was the somewhat testy reply, "you mustn't ask me to explain the Apocalypse. There are limits to even omniscience. I doubt if the Holy Spirit himself, who dictated Revelation, could explain it. Now, I've got other things to do besides talking to you. I haven't been so busy in a million years. So I'll wish you good morning."

"But, Sir, the beasts in Rev—"

"Beast me no beast. Good-day. Raphael, show this person the way out. If I am so pestered with questions again I'll have to forbid the premises to these callers."

And taking up his pen, the Lord went on with his writing, not noticing the profound salaams with which I signaled my departure. I fear that I offended him by my last questions. This may prove very unfortunate to me. The ways of the East are dark, and in case you do not hear from me again, you may surmise that your correspondent has met the fate of those who incur the enmity of powerful eastern potentates. But if this letter reaches you and gets in type, and helps to dispel the prevalent illusions and wild reports concerning the Lord and his plans, I shall be content.

SPECIAL.

BOOK NOTICES.

TO THE POET-LAUREATE. *Louis Belrose, Jr.* Brentano's, Washington, D. C., 1887.

This spirited and musical poem, in the fascinating meter of *Locksley Hall*, is a defence of scientific thought against Lord Tennyson. Whatever doubt may exist about the meaning of *Locksley Hall Sixty Years After* ought to disappear after a careful perusal of the longer and much poorer poem published with it. The whole volume is meant to discredit liberal views of science and politics, by making them appear hostile to morality, and Mr. Belrose is entitled to the thanks of the friends of intellectual liberty and popular government for his defence of scientific thought.

EIN LEBEN IN LIEDERN, GEDICHTE EINES HEIMATHLOSEN. Milwaukee, Wis. Freidenker Publishing Co.

This little volume of poems contains, as its title suggests, the portrayal of a life in song. The author is an evolutionist and his work has, in addition to its poetic merit, a scientific interest. He acquaints us with the various stages of his intellectual development and religious growth, the rise of his hopes and fears, his early faith, his first doubts, his despair in feeling the basis of his religious belief crumbling away and, at last, his satisfaction and joy as he grew into broader thought and attained to higher ideals of life and duty. The love songs abound in fine sentiment and show a refined taste and love of nature. The ideas are elevated and the language simple and elegant.

THE SUNDAY LAW OF MASSACHUSETTS. What it is as construed and interpreted by the Supreme Judicial Court. How it is observed and non-observed and what had better be done in relation thereto. *By a Member of the Massachusetts Bar.* Cupples, Upham & Co., Boston, 1887.

This little pamphlet gives not only all the statutes in full, which cannot be found together elsewhere, but also an accurate and impartial summary of the decisions, some of which have great effect, for instance, in destroying the value of notes and pre-

venting prosecution for fraud. Due attention is called to the fact that the Sabbath is openly broken with impunity by railroads and other corporations, the community appearing to be in favor of the law but against its enforcement. To get rid of the demoralizing effects of laws which people are not expected to obey, it is urged that the Sunday statutes be reduced in Massachusetts, as they have been in other States, sufficiently to make it possible to carry them out. The plan in the pamphlet is to forbid all labor not needed to secure "reasonable personal comfort" or rescue of property "from actual waste," and make proper allowance for travel as well as for "recreation, social intercourse or whatsoever other pastimes be of good report." These recommendations will have all the more effect from the scholarly and dispassionate tone in which they are offered. But it should be remembered, that what needs most to be reformed, not only in New England but even in Chicago, is public opinion, which at present looks at Sunday amusements with a cowardly asceticism worthy of St. Simon Stylites.

MIND, the English quarterly review for January, contains very interesting essays in philosophical and psychological research, the first of which is on "The Perception of Space," by Prof. Wm. James, which he discusses in a matter-of-fact way with great penetration in his quaint and original style. Prof. H. Sedgwick treats of "Idiopsychological Ethics," in reply to the views of Dr. Martineau. James Ward continues his papers on "Psychological Principles." Under the general head of "Research," J. M. Cattell details "Experiments on the Association of Ideas"; J. Jacobs, "Experiments on Prehension"; Francis Galton, F. R. S., gives supplementary notes on "Prehension in Idiots." Prof. J. Dewey discusses "Illusory Psychology," and replies to Shadworth Hodgson's strictures. Prof. C. L. Morgan discusses "The Generalization of Science." There are able critical essays by Prof. H. Seth, T. Whittaker, J. Sully, Grant Allen and Prof. R. Adamson. The book notices include an account of recently published philosophical and psychological works. Edited by G. Croom Robertson, and published by Williams & Norgate, London.

THE ART AMATEUR for February offers a premium of \$100 for the best design for a new cover for the Magazine. This will give a fine opportunity for young designers to try their skill. The drawings must be sent by the first of March, 1887. This number opens with a fine bold sketch of Tennyson made in October, 1886. The old poet certainly does not look as if he had lost either vigor or independence by becoming a lord. Montezuma gives a *pot-fourri* of entertaining gossip and Greta her usual Boston correspondence. There is an interesting account of the Stewart collection which is to be sold by auction in New York in March. This is well illustrated by spirited sketches from paintings of Meissonier and Gerome. Among the decorative designs is a charming little panel representing Winter by Froment. A good deal of space is given to architecture and the decoration of rooms in city and country houses while ceramics, amateur photography and needle-work have their due share of attention and those who wish to employ the Lenten Season in the pious work of embroidering chasubles and other vestments can find instructions for that also. The ever-entertaining correspondence suggests as many questions as it answers. *The Art Amateur* continues its good work of diffusing sound principles of art through the country, besides affording much practical assistance to the amateur who cannot obtain professional instruction. We wish it would give, also, a little more art matter suited to the general reader, such as biographies of living artists, criticisms of schools and of celebrated works.

MISCELLANEOUS.

UNAWARES.

A song welled up in the singer's heart,
 (Like a song in the throat of a bird),
 And loud he sang, and far it rang,—
 For his heart was strangely stirred;
 And he sang for the very joy of song,
 With no thoughts of one who heard.

Within the listener's wayward soul
 A heavenly patience grew.
 He fared on his way with a benison
 On the singer, who never knew
 How the careless song of an idle hour
 Had shaped a life anew.

—*Alice Williams Brotherton in January Atlantic.*

So strong was the bent of his mind in an humorous direction that some theologians have accused him of want of reverence for religion; which accusation may be true of the sticks and stubble men call religion, but not of the genuine article, as we will see by and by. Some of the more strenuous patriots desired the Committee of Safety to require the Episcopal clergy to refrain from praying for the King. "The measure," said Franklin, "is quite necessary; for the Episcopal clergy, to my certain knowledge, have been constantly praying these twenty years that God would give to the King and his council wisdom, and we all know that not the least notice has ever been taken of *that* prayer."

In one of his conversations with John Adams he wittily distinguished Orthodoxy from Heterodoxy by saying "Orthodoxy is *my* doxy and Heterodoxy is *your* doxy." In another place he remarks, "Steele says that the difference between the Church of Rome and the Church of England is only this: that the one pretends to be infallible and the other to be never in the wrong. In the latter sense we are most of us Church of England men, though few of us confess it and express it so naturally and frankly as a certain lady here, who said, I do not know how it happens, but I meet with nobody, *except myself*, that is always in the right."

It is related of Franklin, but I do not know how truthfully, that, when a boy, he slyly advised his father to say grace over the whole barrel of pork and so save time at dinner.

He specially excelled in delicate irony. In a letter to his friend De Chamount (whose house he had occupied at Passy) he says: "As to Tinck, the maitre d' hotel, he was fairly paid in money for every just demand he could make against us and we have his receipts in full. But there are knaves in the world no writing can bind, and, when you think you have finished with them, they come with demands after demands *sans fin*. He was continually saying of himself, I am an honest man, I am an honest man. But I always suspected he was mistaken, and so it proves."—*From a lecture on Benjamin Franklin by W. Symington Brown.*

THE PARKER TOMB FUND.

A fund is now being raised by the friends and admirers of Theodore Parker to improve the condition of his tomb, in the Old Protestant Cemetery, Florence, Italy. The list of subscribers to date is as follows:

| | |
|---|---------------|
| Miss Frances Power Cobbe, England, | £1. |
| Rev. James Martineau, D.D., " | 1 guinea. |
| Professor F. W. Newman, " | £1. |
| Miss Anna Swanwick, " | £1. |
| Rev. Peter Dean, " | 5 shillings. |
| Mrs. Catharine M. Lyell, " | 1 guinea. |
| Miss Florence Davenport-Hill, " | £1. |
| William Shaen, Esq., " | £1. |
| Mme. Jules Favre, Directress of the State Superior Normal School, Sevres, France, | 10 francs. |
| M. Joseph Fabre, ex-Deputy, Paris, France, | 10 francs. |
| M. Paul Bert, of the Institute, " " | 10 francs. |
| Professor Albert Reville, " " | 10 francs. |
| M. Ernest Renan, of the French Academy, Paris, France, | 10 francs. |
| R. Rheinwald, publisher, Paris, France, | 10 francs. |
| Mme. Griess-Trant, " " | 3 francs. |
| Rev. Louis Leblois, Strasburg, Germany, | 5 mares. |
| Miss Matilda Goddard, Boston, Mass., | \$25.00 |
| Mrs. R. A. Nichols, " " | 5.00 |
| Caroline C. Thayer, " " | 10.00 |
| F. H. Warren, Chelmsford, " " | 5.00 |

THE MISSION OF SECULARISM.

BY FELIX L. OSWALD.

In the pursuit of all human enterprises a clear definition of purpose is a chief condition of success. It secures efficient co-operation; it prevents aberrations; it obviates illusions and misconstructions. The progress of *Secularism* has undoubtedly been retarded by such stumbling-blocks. Its doctrine has been mistaken for a gospel of sensuality and egotism, for a depreciation of the higher in favor of the lower propensities of the human mind. "Earthly things should subserve the divine," says our pious brother. "We should encourage the beautiful, the useful will encourage itself," says our æsthetic sister.

Now, the truth is that, in a normal state of social conditions, the beautiful and the *divine* (*i. e.*, the moral metaphysical principle), as well as the useful, will encourage themselves, an excess on either side being naturally followed by a reaction in the opposite direction. When the pursuit of power and wealth had secured the citizens of Rome a surplus of material blessings, the love of arts began to unfold a profusion of spontaneous blossoms. When the sophists of Greece wasted an undue proportion of time on hyperphysical speculation, the satire of Aristophanes, and the practical protest of the Cynics, brought their countrymen back from cloud-land to earth. After the rush for paradise had led the hosts of Islam from conquest to conquest, the victors devoted their leisure to architecture, to rational agriculture and science. When the population of China seemed to sink in the marasmus of selfish sensuality, Confucius, with signal success, though without an appeal to the authority of any supernatural agencies whatever, inculcated the duties of a sublime altruism. Speculative religion, *i. e.*, the study of spiritual manifestations and cosmological traditions, has received all the attention it deserves, even among barbarous nations, in the very earliest ages of authentic history. The normal progress of social development leads from militant barbarism to the organization of a military commonwealth, to political stability and the recognition of civil rights, to co-operation, industry and wealth, to art, literature, refinement and science. Nations grow as trees grow and have to spread their roots and acquire stamina before they can produce flowers and fruit. The promise of the rose

slumbers in the unsightly root of the thorn, and spring-time will swell the buds of the wild mountain-flower as well as of the best-nursed garden plant.

But about the time which forms the significant turning-point of our chronological era the nations of the Aryan race were stricken with the plague of a moral epidemic. An Asiatic pest, the poison of the life-blighting doctrine of pessimism, crept over the moral atmosphere of the mediæval god-gardens; for a series of centuries the light of reason underwent an eclipse, the ethical standards of millions of our ancestors were perverted, first by an insidious depreciation, and afterward by a remorseless suppression of their normal instincts. The ideal of human endeavors was no longer the Beautiful or the Useful, but the *Woeful*; a capacity for self-torture became the standard of human virtue, the renunciation of all earthly blessings the measure of human merit; health, manhood, freedom, science and industry were sacrificed on the altar of antinaturalism, and during a millennium of madness the progress of sixteen nations of the noblest race was limited to the invention of new instruments of torture.

As the waters of the pent-up stream gradually rose against the dam, its embankments were constantly strengthened; the vast and powerful organization of the mediæval church seemed to defy the very hope of resistance; but nature at last prevailed. The pressure of the accumulated waters finally burst their fetters, and the flood of revolt, forcing its way through ever-widening gaps, inaugurated that era of rapid progress which in the course of the last fourteen decades has tried to retrieve the delay of a long series of centuries.

But the guilt of a thousand years' crime against Nature has not yet been expiated. The river has broken its dam, but its ancient bed has been overgrown with weeds and choked with drift-sand; the rushing flood has torn out new channels and wastes its waters, surging in eddies and shallows here, dashing against hopeless obstacles there; an undoubted advance in the right direction is attended with an undoubted aberration and abuses of a suddenly-regained freedom.

Orthodoxy, the religion of antinaturalism, proposes to remedy the evil by reconstructing the dam, and thus putting an end to further progress, as well as to its abuse.

Secularism, the religion of reason, proposes to confine the river to its normal banks, and limit its waste without

hindering its progress. Anarchism, the religion of revolt, proposes to break all flood-gates and give Nature a chance to work out her own salvation.

Time has proved the futility of the first plan by the power of a reaction, which was only strengthened by resistance and delay. But the violence of that reaction, though its unaided strength may surmount all obstacles, cannot dispense with guidance on its forward way. Nature cannot at once accommodate herself to abnormally-changed circumstances, and we must admit that the normal instincts of the human race, which anti-naturalism has failed to suppress, have at least been sadly perverted. The long-suppressed love of personal liberty has been perverted into a love of license, a hatred of laws and authority, a tendency to nihilism and reckless self-help. The suppression of harmless recreations has begot a furtive delight in vicious pleasures and a tendency to evade the appeals of reform, asceticism having masqueraded in the guise of virtue till its victims have forgotten to distinguish her garb from its counterfeit. The suppression of natural science has driven the submissive into stolid nescience—contented renunciation of intellectual pursuits—the bolder into pseudo-science, the morbid mysticism and neo-gnosticism that finds supporters in the ranks of the most sincere apostates from the tenets of the established creed. They have exchanged the drugs of their spiritual poison-mongers for an equally baneful antidote, like opium-eaters who break the thralldom of their habit only to find themselves fettered by the bane of the liberating specific. The suppression of free inquiry has fostered the loathsome vice of hypocrisy. People who for generations saw their holiest rights outraged in the name of a pretended truth of revelation, have avenged their wrongs on truth itself, by making ethics a synonyme of cant and hiding their private theories on the highest interests of their species behind a mask of habitual dissimulation.

The main purpose of Secularism has been tersely defined as the problem of rescuing the human mind from its exile in ghost-land; but many of our brethren have endured that exile till they have become strangers in the house of their Mother Earth. They are still biased by an hereditary lack of trust in the competence of their natural instincts, and it is the mission of Secularism to revive that trust. We must redeem the imputation of *worldliness* from its implied reproach, and restore the *cosmos* of our wonderful earth to its ancient associations of beauty, bounty and self-maintaining order. We must replant the groves of Pan and awaken the God of fields and forests from his long slumber; we must teach the votaries of Nature to worship their God in his own temple. Earth must once more become the cherished home of all her children. Her blessings must no longer be sacrificed, neither in offerings to the Moloch of supernaturalism, nor in the mad riots of

rebellious vice. We must demonstrate the identity of virtue and happiness by teaching the refugees from the bondhouse of asceticism to distinguish the monitions of their normal instincts from the morbid cravings of vice, and the rights of natural liberty from the claims of lawless insolence. A religion of reason and science will make conformity an honor rather than a reproach to its confessors, and reduce dissent to a synonyme of infidelity to the laws of Nature. The exponents of that religion will invite, rather than discourage, free inquiry; knowledge will become an aid to faith, and converts will no longer be obliged to renounce their allegiance to truth and self-respect.

Secularism will be at peace with all other religions, except the pseudo-religion of that earth-blighting insanity that teaches the antagonism of body and mind, and would sacrifice the living to the dead as it sacrifices the realities of the present world to be chimeras of ghost-land. Against the life-poisoning delusions of that dogma, Secularism invites the alliance of all saner creeds, even in the name of religion itself, since neither physical nor moral health has ever encountered a deadlier foe than the system that inculcates the vanity of secular pursuits and depreciates the blessings of earth as so many evils in disguise. To how large an extent that truth has already been tacitly recognized, may be inferred from the fact that millions of our fellow-men even now devote all the energy of their working days to a pursuit of those temporal blessings which their Sunday creed continues to denounce as sinful vanities. The doctrine of Pessimism has thus in a two-fold sense become a sham-religion, and the mission of Secularism involves the task of obviating the danger of the moral interregnum threatened by the collapse of a more and more evidently spurious basis of ethics. The solution of that task does not require the preternatural aid of a new revelation, but only the re-establishment of a truth which long guided the pursuit of happiness before the world of our forefathers was darkened by the shadow of the dreadful eclipse, the truth, namely, that the highest physical and the highest moral welfare of mankind can be only conjointly attained.

POSSIBILITIES.

BY ROWLAND CONNOR.

The first clear indications of human existence in this world seem to come from the last pre-glacial period. The date of these indications cannot be given with any approach to accuracy. The flung-out hypotheses of our wise men will lasso the exact truth some day; but as yet we can only affirm that the race of man is many thousands, possibly even hundreds of thousands, of years old. There is no doubt, however, that pre-glacial man, alike in Africa, Asia, Europe and America, was only a

hunter of other wild animals and a miserable savage. Long ages passed before the cave-dwellers ceased to break the marrow-bones of the ancient mammals of Europe, and through all those ages man was still a savage. His progress at first seems to have been almost immeasurably slow. The germ of nothing that can be called civilization is discoverable until a comparatively recent time, and what that germ was, or when it first appeared, is more a matter of speculation than of knowledge. But there was a germ; and it grew; and real civilizations budded from it in the Nile and Euphrates valleys, and a few other spots, and blossomed brightly some five or six thousand years ago.

But these blossoms could not live. They were hemmed in by the wilderness growths of savagery, and slowly died. But, dying, some pollen was blown to European soil, and there helped to fertilize some other early blossoms that gave us the greater civilizations of Greece and Rome. But these, too, were blighted. Northern and Eastern hosts of barbarians were flung upon and trampled over them, and for a thousand years civilization struggled to live. Only recently has a civilization bloomed, so profuse, so hardy, with roots so deep and spreading, that savage growths recede before it. It cannot be crushed, or even badly injured, by the same enemies that dealt so cruelly with its immature and restricted predecessors of former times. This last civilization is destined to possess the earth.

What are some of its possibilities?

Although, compared with the age of his ancestral tree, the civilized being is very, very young, already the distance between him and the savage is so vast that they seem to belong to distinct orders. The anatomist's probe and scalpel may find them both alike, but, between the beastly savage who cannot add two and two, and the man who can lovingly read *The Data of Ethics*, there is apparently less real kinship than between the former and the chimpanzee. And yet the disciple of the philosopher has sprung from his barbarian ancestor almost as suddenly as the butterfly springs from the grub. There is a mysterious potency in civilization. It puts an elixir into the blood, or recombines the atoms of the gray matter of the brain, or mingles a new element somehow or somewhere with the chemistry of man's make-up, so that he is transformed, and we cannot from his long past, but only from his recent development, prophecy what he may become. Ages of worm-life and a thousand years of chrysalis, but the wings began to unfold only yesterday.

I put especial emphasis upon the comparative newness, as well as the assured perpetuity, of modern civilization, because only as we do so can we rationally account for the amazing growths it must soon produce. The "lost arts" of the ancients have caused some sceptics to question the permanency of our analogues

modern productions. But circumstances have changed. What is born to-day in invention, or art, or science, or philosophy, will live forever, if we wish it to live. And it will not only live, but it will continually reproduce. Printing, for instance, which is practically new, has given us within the last fifty years a host of other arts, and professions, and machines innumerable; but a hundred experimenters, who are carefully watching it, could prophesy with calm conviction concerning a host of other arts just starting from it. Men are yet living who trod the deck of the first steamboat on the Hudson river, and men are not old who ante-date the familiar railway and telegraph; but of what are these not the parents, and of what children yet unborn will they not be the sires hereafter!

Not only is inventive genius more fertile with each succeeding year, but our assimilation of inventions is more rapid. Less than ten years ago the writer listened to the first lecture on the telephone in New York city, and was amused, with other auditors, when the curious little toy reproduced the notes of a choir on the opposite side of the river. Its practical usefulness was then a dream of the inventor. But three years afterward, in the primeval woods of the great Northwest, he sat in the locomotive cab of a logging railroad while the engineer climbed down to unlock a rough box nailed to a tree, that the telephone within it might bring him his orders from the camp "boss." Our progress in inventions and in the practical assimilation of their results will be much more rapid in the next fifty than in the last fifty years. We have not yet fairly learned to handle the new tools we are working with.

Attempts to predict the future of man on the earth have been made very often, but are mostly of a fanciful nature. They have been designed to furnish amusing reading, and have seldom paid much regard to the necessity of a basis of fact. Utopias, also, are many, but their authors have written them chiefly as pleasing methods of advocating some pet social theory, and they are therefore useless for our present purpose. By confining ourselves strictly to legitimate deductions from present knowledge, I believe that some broad outlines of the future may be drawn with considerable accuracy. The unavoidable errors will be those arising from a non-consideration of unknown forces yet to be discovered.

Of mechanical inventions there are several just at hand which will be followed by results fully as important as those due to the steam engine. One of the first in order of time will be the submarine boat. Its feasibility has already been demonstrated in New York harbor—a feeble beginning, indeed, but no more imperfect than the beginnings of gunpowder and the printing press. Of the knowledge to be acquired under the waves, and of the changes in commerce and

naval warfare sure to follow the practical success of submarine navigation, there is room for abundant speculation. But we may be reasonably certain that Jules Verne's imaginary *Twelve Thousand Leagues Under the Sea* will have its wonders surpassed by the stubborn facts of one hundred years hence.

Closely following submarine navigation, or perhaps, preceding it, will come the safe navigation of the air. The inflated balloon has blocked the way of invention for many years, but, now that its principle is seen to be erroneous, and we know that the successful flying-machine must be heavier and not lighter than the atmosphere, the production of a practical machine may be looked for during this generation.

Of more curious interest, though not likely to be followed by as important practical results, will be the perfecting of the "electroscope"—that remarkable instrument which virtually telegraphs rays of light, and, by throwing them upon a metallic disk, enables us to look upon actions taking place at a distance with the same ease and distinctness with which we now receive sounds by the telephone. Some combination of these two instruments will enable us in the future not only to talk with distant friends but to look at them while we are talking; and that which is possible to-day within a distance of fifty miles becomes possible on the morrow across the Atlantic ocean.

Long before any one of the above inventions is brought to perfection, however, the new glass, recently invented in Germany, and which is said to add almost fabulously to the power of the microscope, will become the agent of wonderful discoveries, and presumably, at a later date, we may expect analogous additions to the power of the telescope.

It is evident that we stand at the thresholds of four wonderful worlds, and hold in our hands the crude weapons to be perfected for their conquest—the ocean world, the aerial world, the world of the infinitely little, and an astronomical world as far surpassing our present one as that of the observer with a Lord Rosse telescope exceeds that of the Chaldean shepherds. And instruments, of which the present electroscope is the forerunner, will bind together the scientific conquerors of these worlds in so close a communion of workers that they will seem to be the inmates of a common workshop, and each one will have the help of the accumulating riches of all.

That all railways, including those of city streets, will soon be run by electricity, and that all heavy trucking and other similar work will be done by the same agent, rendering horses useless, except for pleasure purposes, I regard as almost a self-evident proposition. The same agent will also be employed in the domain of household economy in manifold ways, lessening greatly the disagreeable and enervating drudgery now insepar-

able from housekeeping employments. When breakfast can be prepared with about the same amount of labor as now attends the touching of an electric button, as it will be some day, the momentous and perplexing servant girl problem will be forever solved.

Our sources of mechanical power will greatly change. We now dig from the bowels of the earth, at great expenditure of labor, the compact sunshine of the coal-beds, stored away ages ago, and neglect entirely, as a source of power, the sun-heat poured daily upon the surface of the earth. Invention has already been directed toward this source, and must soon succeed. Sun-power should before this have taken the place of coal in all inland places. On the sea-coast, however, the immense tidal energy, which now daily goes to waste, may profitably replace it. I do not think our coal mines will ever be exhausted. Long before that point can be reached, mankind will be using a more economical source of power.

Vast commercial, industrial and social changes will follow the attainment of the possibilities already indicated and will largely occur within the next one hundred years. Still greater changes, however, will follow certain other attainments, which, fortunately or unfortunately, will be of later date, and will be reached gradually. One of the greatest of these, to come with measured tread, and to be perfected many years hence, will be the preparation of all food by laboratory manufacture. Organic chemistry is steadily moving in this direction, and, eventually, the nutrition needed will be exactly adapted to the wants of the body, and will be furnished on demand. At present we are fed bunglingly. The processes of digestion are seldom completed. Bodily force is dissipated in the disposal of waste and injurious matter, and the normal energy of each person is kept very far below its possible or maximum limit. Of course, all kinds of farming and pastoral life, for profit and livelihood, will be ultimately abolished, and the forms of social organizations will be correspondingly changed.

Side by side with the gradual attainment of this result will be the mastery over all contagious and infectious diseases, whether their origin be traceable to poisonous effluvia or microscopic germs. But long before the abolition of diseases, we may expect the extermination of all ferocious and unnecessary animals, noxious weeds and insects, and the numerous parasites which now infest the human body and rob it of much strength. Moreover, it is apparent that the abolition of disease, the extermination of all varieties of animal and vegetable enemies, the possession of a perfectly adapted and nutritious food, and the accompanying discoveries which will prevent the ossification of the tissues, or those equivalent and analogous changes which produce old age, together with the cessation of that large part of the

struggle for existence which is connected with these important factors, will result in a great prolongation of human life—not an old age of “labor and sorrow,” but a lengthened maturity of vigor and wholesome enjoyment.

Thus far the possibilities indicated are supposed to be desirable, or at least not objectionable, and may come to pass without the necessity of any serious revolution in human nature. And if all men were thoroughly moral, and were disposed to exercise whatever power they might possess for the good of their fellow men, no one need wish for any limit to their future greatness. But, unfortunately, of some men it may be said that they are thoroughly immoral, and many others, if not immoral, are certainly weak or stupid. The great bulk of men have not that intellectual and moral development which would allow them to possess power with safety to themselves and others. No right-minded person, for instance, would wish to give to the brutalized Russian serfs dynamite enough to blow up the Ural mountains. They might use it, instead, to annihilate the German Empire. But we must face the fact that this supposed power in the hands of the ignorant serf may at some time in the future, and perhaps very soon, become the real power of every man, good, bad or indifferent. The discovery of our ability to store or box electricity is a terrible fact, when we consider its possible consequences. As yet only a few are masters of the secret; but it will become a common property, and is susceptible of astounding modifications. To-morrow, any man, good or bad, may have in his pocket, or in his pipe, power enough, and subject only to his will, to annihilate whole communities. That the ordinary man of the world will be forced to assume this awful responsibility, it seems to me no one can doubt. Will he, before that time comes, cease to be the same man with whom we are now most intimately acquainted? Give to our present biped acquaintance the ability to exterminate armies with a lightning flash, added to the power of sailing at will through the air, or of passing at will and in safety beneath the ocean waves, and he would depopulate the earth.

If the human race is to be preserved, the progress of scientific invention and discovery will make necessary the complete extinction of all immoral and weak men. This may be effected by natural causes or by social decree. I mention these two methods because I believe that our rapidly-developing civilization can be assimilated only by certain progressive races, and by the best portion of these races. It is a well-ascertained fact that few savage races, if any, can endure civilization. They are blighted by its glare, and, in close contact with it, perish in a few generations. This process will continue more rapidly hereafter. There is no hope of an earthly immortality for the great mass of mankind, and, among the progressive and enlightened races, self-pres-

ervation will necessitate the extinction of vice and crime of all kinds, as well as the cessation of all war. Social convulsions of the most gigantic kind may first intervene, but I have no doubt that ultimately power will remain in the hands of those who are most worthy to use it. In the nature of things nothing else is possible.

When the storms have blown over, the survivors of mankind will possess powers almost divine. Bodily energy and brain force will be wonderfully developed. Men will perceive more clearly, learn more readily, think more accurately than they do now. Problems, now difficult, will almost solve themselves. All mere schooling will become exceedingly rapid. Difficulties which now vex the ablest, will be readily disentangled by immature minds.

And perhaps, even, at last, men may be able—say one thousand years from now—to evolve a religious and philosophical creed which shall contain imperishable germs.

THE HARMONY OF THE SPHERES.

BY PAUL CARUS, PH.D.

Some months ago a pamphlet was published by Dr. B. M. Lersch, *Ueber die Symmetrischen Verhältnisse des Planeten Systems*, (On the Symmetrical Proportions of the Planetary System), which is of more than ordinary interest, since it is the conclusion of a series of scientific aspirations, thus affording an unusual gratification to the human mind. Its subject is the arrangement of the planets in our solar system, and its result is the discovery of the law which governs the revolutions of the celestial bodies—a law revealing the simplicity which underlies the most complicated phenomena and furnishes evidence of the harmonious grandeur of the creation.

Even in the Pythagorean era the harmony of the spheres was recognized and taught as the rythmical sounds produced by the proportionate motion of the celestial bodies; and although the idea was rejected by Aristotle, who considered it an ingenious but erroneous hypothesis, it has been transmitted to us, not because accepted by the people of later ages—who rather agreed with Aristotle's view—but for the reason that the idea was too striking to be easily forgotten.

The fact that we do not hear the music of the skies does not disprove it; because, as Pythagoras said, we are accustomed to it from our infancy, and modern physicists, who cannot, on the ground of their scientific theories, object to the possibility of sound produced by the motion of heavenly bodies in ether, may say that at least the human ear is incapable of perceiving sounds with such long intervals of undulation.

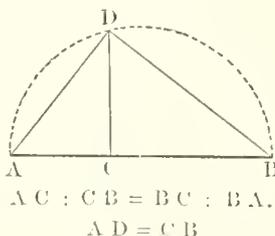

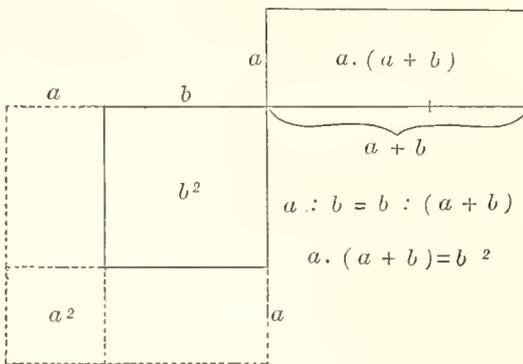

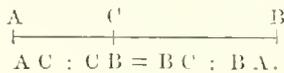

Interesting though it may be, the question whether the orbits of the stars resound with music will not be

included in this discussion, which shall be strictly confined to the consideration of whether the planets, in their circuits, are harmoniously arranged. However romantic this idea seems to be, it is, nevertheless, more than simple poetry and it contains the germ of a cosmic truth.

Pythagoras' doctrine of the harmony of spheres rests on the theory that *number is the essence of things*. Modern chemistry shows the importance of the numerical proportions in the elements of the different substances; and more marvelous still, as we learn from the *Law of Multiples*, the different chemical combinations take place according to geometrical principles.

Of all geometrical proportions that of the *extreme and mean ratio* is at the same time the most simple and comprehensive in its application. Euclid understood it and the subject is treated in his 30th proposition of the 6th book. Owing to its many remarkable corollaries, the ancients called it *proportia divina*; it is known in Germany as *the golden cut*.

It depends on the division of a line into two unequal parts, in such proportion that the smaller segment is to the larger as the latter is to the whole. The rectangle constructed with the smaller part and the whole is equal to the square of the larger. Again, if a right-angled triangle be erected upon the whole line, with its right angle situated in the perpendicular line drawn from the point of division, then the smaller of the sides containing the right angle is equal to the larger portion of the line which is thus divided in the mean and extreme ratio.

These and other corollaries are of great interest to mathematicians, and whoever understands something of the seductive harmony of geometry must be impressed with its grandeur and beauty, as other people are by the harmony of music or beauty of form, which, we must remember, is merely applied mathematics.

The harmony of the universe which, in addition to other evidences, favors the truth of that philosophic view which I call *Monism*, is in its ultimate principles based on mathematics and can be proved from geometrical axioms.

Johannes Kepler, the first strong adherent and most powerful defender of the Copernican system, held, if, as Pythagoras taught, our planets in their circuits round the sun move in rythmical distances, a planet should exist between Mars and Jupiter. He considered, the space between their orbits was too great to correspond with the intervals between the other planets, which revolve around the sun in distances regularly increasing.

This suppositional planet could not be found, but Kepler indicated the region in the skies in which it should be situated.

Two centuries afterward Kepler's idea was verified; for, although the missing planet was not found, a larger number of smaller ones, generally called asteroids or planetoids, were discovered to be in this area. They amount to about 300 in number and are either a failure of a planetary formation or the ruins of a larger body which, by some unknown agency, was shattered into many fragments.

This discovery, based upon the theory of celestial harmony, revived the interest in the law of proportion regulating the intervals between the orbits of the heavenly bodies.

Professor Titus, of Wittemberg, was the first astronomer who hazarded and established a formula of the distances between the planets. He said that in round numbers the distance from the sun to the first planet, Mercury, was 8,000,000 geographical miles (each geographical mile equaling 4.66 English miles); to the second, Venus, 8+6 million miles; to the third, our Earth, 8+ (6×2); then to Mars, 8+ (6×4); to the Asteroids, 8+ (6×8); to Jupiter, 8+ (6×16); to Saturn, 8+ (6×32) and to Uranus 8+ (6×64) million miles—a mixture of an arithmetical and geometrical series, as mathematicians would style it.

Facts agreed pretty well with this theory, although there are trifling differences, and *Titus' series*, as it was called, served for a long time as an excellent aid for remembering the distances of the planets in round numbers. But when, in 1846, *Galle*, at that time director of the Observatory in Breslau, discovered the most remote planet, Neptune, and calculated that its distance from the sun is about 600,000,000 miles, while, according to Titus, it should be over 700,000,000, the reliability of

this series was destroyed and, consequently, it is now regarded by astronomers as a mere curiosity.

Notwithstanding this failure, the aspiration of finding the law of the rhythm of our solar system was not abandoned. Professor A. Troska,* ceasing to regard distances as the proper clue to the solution of the question, ventured on a new explanation, which he published in 1875.

His theory is that twice the time of one planet's revolution is equal to the sum of the revolutions of its two neighbors. Thus, twice the period of the circuit of Venus, which is 450 days, is approximately equal to the revolution of Mercury, its interior neighbor, and that of the Earth, its exterior, for Mercury revolves in 87 and our Earth in 365 days, which make 452. Again, by doubling this number ($452 \times 2 = 904$), we have the sum of the revolutions of Venus (225) and Mars (686), which together are 911 days.

Again, this number doubled (=1822), is about equal to the addition of the revolutions of Earth (365) and one of the Asteroids (1,500), together 1,865 days.

This proportion is also applicable to the orbits of the exterior planets. The sum total of the periods in which Saturn and Neptune complete their circuits is $10,759 + 60,186 = 71,045$, which is nearly equal to twice the revolution of Uranus, that is, 61,374 (the exact period being 30,687).

When we consider the entire series of the planets, "the law of duplication" is still sustained; for the sum of the days of revolution of Mercury (1), Earth (3), one medium Asteroid (5), Saturn (7) and Neptune (9), occupy nearly twice the period necessary for the revolutions of the interposed planets—Venus (2), Mars (4), Jupiter (6) and Uranus (8).

| | | | |
|----------------|--------------|--------------|--------------|
| Mercury..... | 87.97 days | Venus..... | 224.70 days |
| Earth..... | 365.26 " | Mars..... | 686.98 " |
| Asteroids..... | 1,500. " | Jupiter..... | 4,332.59 " |
| Saturn..... | 10,759.22 " | Uranus..... | 30,686.82 " |
| Neptune..... | 60,125. " | | |
| | | | ————— |
| | | | 35,928. days |
| | | | × 2 |
| | ————— | | ————— |
| | 72,836. days | | 71,836. days |

Showing the slight difference of about $\frac{1}{10}$ of the total.

Professor Troska admitted that this ratio is only approximately 1:2; if calculated with more accuracy, it is 1:2.03.

Other investigators have approached the problem from a different standpoint and in the year 1854 an exceedingly interesting work was published by Professor A. Zeising, who recognized that nature manifested a wonderful tendency to construct according to the proportion of the extreme and mean ratio. We constantly detect the application of this law; it controls

the shape of many crystals and flowers, the construction of animals and particularly of the human form. Wherever a constant proportion exists, it generally depends upon that ratio which is termed *the golden cut*; and it is with awe and amazement that we thus recognize the mathematical harmony of the world.

It is additionally interesting to discover that artists in their creations unconsciously apply the same remarkable principle. In architecture, as well as in statuary and in painting, as Zeising showed in the above mentioned book, the *proportio divina* is repeatedly introduced, as in the Sixtina Madonna, by Raphael, and other masterpieces.

Professor Pfeiffer, of Dillingen, lately enlarged Zeising's doctrine and, among other additional observations, he corroborated the importance of this proportion in the planetary system. The apparent lack of regularity in Professor Troska's series subsequently induced other scientists to re-investigate the question and thus led to its final solution.

A mathematician, Dr. M. B. Lersch calculated the periods of revolution when bodies revolve in distances of the extreme and mean ratio, which is 1:1.61. Basing his calculation on the famous law, which is established by Kepler, that *the squares of revolution are proportionate to the cubes of the mean distance*, he discovered that if two planets move at distances of 1:1.61, they must revolve in periods which are as 1:2.03. This number, however, agrees better than Professor Troska's "law of duplication" with facts and concurs strictly with the ratio of the periods in which the planets revolve. From this we may fairly infer that the Divine proportion is the regulative law of the circuits of heavenly bodies.

In consequence of this consideration, we cannot deny that the revolutions of the fixed stars may follow the same principle; we must recognize it as a universal law which governs the movements of the ponderous masses of suns as well as the formation of the tiny limbs of the smallest insects.

Thus the harmony of the cosmic laws may be recognized as an established fact; and the most advanced scientists of to-day, like Pythagoras of yore, look for explanations of the problems of nature in the mysteries of number or proportion.

There is unity in the structure of the universe and there is unison in the laws of nature. If the scientist presupposes such harmony to exist universally in the domain of his investigation, he will never err, because, as Plato said, *the Laws of Nature are geometrical thoughts of God*.

Conscience does not come from natural or hereditary good, but from the doctrine of truth and good, and a life according thereto.—A. C. 6208.

* I am indebted to Professor Troska for the facts here mentioned, through an item from his pen in *Was Ihr Wollt*, Leipzig, 1886.

A THEOLOGICAL PARADOX.

BY MINOT J. SAVAGE.

That a house should seem to stand and the people continue to live in it as though nothing had happened, and this after all of its foundations had been removed—this is the paradox which I have in mind. And it is one of so striking a nature that one will hardly find it true in any other domain except that of theology. So remarkable a sight as this is worth looking at. Let us, therefore, consider it a little and see what lessons it may have for us.

The theological structure which orthodox Christianity has erected is clear-cut in outline, bound part to part, and thoroughly consistent with itself. As now we examine a few of the main features of the "plan of salvation," all this will appear.

1st. This world—a province of God's universal kingdom—is in a state of rebellion. Every man, woman and child is born into this rebellious condition. The state of nature is one of alienation from God and all good. No matter how good a man may be, in the ordinary sense of the word, he is a rebel; and this fact taints all that he is or does. And until he "throws down the arms of his rebellion," no natural virtues can at all avail to put him in right relations to God.

This is perfectly reasonable on this governmental theory of the world. Sir Harry Vane's virtues did not make him any the less a traitor to the king. So it is rational and logical for Mr. Moody to say: "Morality don't touch the question of salvation." Of course not, on the basis of this supposed theory and the supposed facts.

2d. God, against whom this causeless and wicked rebellion has been raised, has a perfect right to choose as to what terms he will require as the condition of forgiveness. Man, who deserves only death, has nothing to say on this subject.

3d. In order to maintain the majesty of his government and the inviolability of his laws, God is under the necessity of making such a public example of his hatred of sin, as well as of his love, as will justify in the eyes of his intelligent creation his extending a free pardon to rebellious man. To this end the second person of the Trinity takes on human nature and suffers the penalty of the broken law. This secures the double end of vindicating God's justice and displaying his forgiving love.

4th. Now he is free to pardon all those who accept this offering as made on their behalf. And they have no right to complain if pardon is refused on any other terms.

5th. On this theory the Church is made up of those who have accepted these terms. Such persons become the nucleus of a growing army of loyalists. It is their business to fight against whatever tends to continue this

rebellion and to do all they can to induce God's enemies to lay down their arms.

6th. Those who become loyal are the willing subjects of God's kingdom and so entitled to share God's final victory and the blessings of his heaven. Those who remain rebellious are followers and friends of Satan, the leader of God's enemies, and must expect to share his ultimate defeat and the pains and penalties of his prison-house.

This is the general scheme of things on which all the activities of the Orthodox Church are based.

Now, everybody knows that the entire foundation of this whole theological structure is the story of the Garden of Eden and the fall of man. If man has not fallen, then this world is not a rebellious province of God's great kingdom. If man is not fallen, all the talk about providing terms or conditions of forgiveness is uncalled for. If man is not fallen, there is no need of the stupendous miracle of an incarnate and crucified God. If man is not fallen, the radical distinction between the Church and the world breaks down. If man is not fallen, the popular dreams of heaven and hell are only dreams and do not accurately represent the future destiny of man and woman.

How stands this question then? Plainly, thus: In no civilized country to-day is there a boy or girl of fourteen years of age who has not the means of knowing that the story of the fall of man has no more reasonable basis of belief than have the stories of Hercules. Not only has it no rational support, it is beyond question disproved. That is, another story as to man's origin and nature is so thoroughly established that, but for the theological bias, no intelligent person could be found who would think for one moment of questioning it.

Even the Biblical support for the story of the Fall is almost wholly confined to the theological discussions of one man, Paul. The older and greater prophets say nothing about it. It appears in the Old Testament only after the contact of the Jews with the Persians, at the time of the captivity. For all competent scholars know that the early parts of Genesis, containing the story, were not composed until the time of or after the captivity. This, then, is a Pagan, Persian legend, and only that. It is a Pagan way of trying to account for the sorrows and evils of life. According to the orthodox theory, Jesus was God coming to earth to save man from the results of the Fall. And yet, curiously enough, he does not seem to know anything about it.

But even though the Bible were full of it, from beginning to end, still we know, on other grounds, that it is not true. A belief in the *Ascent* of man has taken the place of a belief in his *Fall* in the minds of all free and competent students.

Of course, it is to be expected that all those who still believe the story of the Fall should keep on in their

endeavors to "save" people after the old methods. But now comes the wonder of our *theological paradox*. Those who still believe this story are not nearly enough to continue the activities of the Churches on their present basis. Thousands of persons who do not believe it at all any longer still help to continue all these old activities just as though nothing had happened. Many among those who do this are ministers; that is, they have seen the entire foundation of their theological house taken out and yet go on living in it, and asking others to come into it for safety, as though they believed it still founded on the everlasting rock. And yet it ought to be plain, to even the feeblest intellect, that if this race of ours is not a "fallen" one, then—whatever else it may need—it does *not* need to be "saved from the effects of the Fall."

Let us now note two or three great evils that result from this paradoxical condition of affairs.

1st. It is kept up at a terrible cost of the sincerity of those who are even "silent partners" to what must hereafter be only a pretense, though ever so "pious" a one.

2d. Only less serious than this is another evil. If a physician thinks a patient is ill of a certain disease, of course he will treat him for that. But should he find out that the disease was of entirely another character, what would he do? And what would people be justified in saying if he should keep on doctoring him for the first supposed disease? If the human race has fallen, and the old theory about it is true, then, of course, a certain method of treatment is rational and helpful. But if it has not, and the old theory is not true, then the old treatment is not only injurious, but it stands square in the way of such a course of medicine as might put the patient on his feet. Consider, therefore, the waste of time, of money, of thought, of devotion and enthusiasm that has been going on for a thousand years. That the world has gradually been improving is no justification of these theories. For, in the first place, it has improved more rapidly by as much as these old beliefs have become less and less influential. And, in the second place, patients often improve in spite of, and not because of, their doctors. And, in the third place, during the periods of the most rapid improvement, a thousand other agencies have been at work, through the activity of thousands who had rejected the old beliefs.

If only all the intelligence, the time and the money of the civilized world (which are now wasted on the old methods) could be directed to finding and curing the *real evils* of the world, the long-dreamed-of "kingdom of God" (the real kingdom of man) might be brought to pass in a single century. In the nature of things there is no reason why this old world should not become a garden, filled with intelligent and happy peoples.

In giving up the dreams and legends of the past, nothing is lost but illusions; and what is found is "the

truth that"—in old theological phrase—"is able to make men wise unto salvation." And *this* salvation is from the *real* evils that destroy human happiness and human life, and not from *shadows*.

MONISM IN MODERN PHILOSOPHY AND THE AGNOSTIC ATTITUDE OF MIND.

BY EDMUND MONTGOMERY.

Part II.

And now to Schelling's Monism, which, together with Hegel's, fruitfully and nobly inspired so many minds, but, it must be confessed, also deranged not a few.

Drawing strength from Kant, from neo-Platonic traditions, from the great mystic, Jacob Boehme, from Bruno and from Spinoza, Schelling worked out a monistic system of transcendental realism. Transcendental *realism* it has been called, because it assumes that the objective world is not merely a product of thought, but that it pre-exists as eternal reality within the source of all being. When the creative Ego, by force of its productive imagination, evolves the world, as Fichte taught, surely it does not evolve it at random out of nothing but mere fancy. The process of mental realization can be only a bringing into consciousness of some definite content already subsisting in the depth of being. On the one side there is the power of consciously realizing this content; but on the other side there is the content itself. Both these moments, subject and object, the ideal and the real, spirit and nature, are thus identical and constitute together the absolute reality, which is the all-containing and all-efficient matrix of whatever there is in existence. We find, then, two different propensities operative in the absolute. The one "positive, real, productive, realizing the infinite in the finite. The other negative, limiting, ideal, redissolving the finite into the infinite." The former in its manifestations constitutes the realm of nature, the latter that of intelligence; both together, our known world.

In this kind of world-conception a source of being, potentially containing everything, is presupposed and treated as a logical totality, from which any sort of particular configuration of concepts may be conveniently deduced. And the interest we may take in such an interpretation of nature depends thus wholly on the genius of the propounder and very little on the actual truth of nature itself. The logical drift of all systems of transcendental realism is to conceive the source of being as unconscious. Hartmann, in our time, has made this conception the central idea of his system, a Monism of unconscious, transcendental will, logically evolving the world.

Hegel, the classical propounder of transcendental *Idealism*, is an extreme representative of the anti-naturalistic mode of interpreting nature. His system is unmitigated Panlogism, a Monism of self-evolving logical

reason, of the formal, deductive sort. Thought, with Hegel, is uncompromisingly identical with being. The task he proposes is to gain an understanding of the all-comprehending ground of such being, which ground he unhesitatingly pronounces to be eternal and absolute reason and nothing else. To be able to accomplish this task, we have to place ourselves in an attitude of expectancy and observation, merely noticing and confirming with our discursive reason the self-unfolding of the content of absolute reason. This occurs by dint of a dialectical process, which begins with the most comprehensive concept coming into ken and bringing with it its equally comprehensive negative. The synthesis of this thesis and antithesis evolves a less comprehensive but more concrete concept, which again brings with it its negative and so on and on, till the most concrete concepts are reached. The keeping in mind, then, as much as possible, of the whole series of evolved concepts, together with the manifold relations they bear to one another, and unifying the whole in as complete an "idea" as we can form—in proportion as we succeed in this our individual reason approaches absolute reason.

Hegelianism has indulged in such absurd abuses of productive imagination that it is no wonder it became the laughing stock of natural science. But the idea of the universal reason progressively evolving itself in the revealed world, imparted suddenly meaning and order to the scattered, disconnected and seemingly purposeless facts of human history. And it is chiefly to this Hegelian "idea" that we owe the manifold and very successful attempts to discover in the records of the past the course of development in human affairs.

Pessimism is, in truth, the consistent practical outcome of any kind of system, assuming as pre-existent an all-containing and all-efficient potency, through whose affections, emanations, manifestations or creations our known world comes into being. For, according to our moral standard, the production of something not only infinitely lower than its producer, but destined, moreover, to pass through a life full of strife and misery, must be looked upon as a most grievous and deplorable misdeed, to be atoned for only by utter inhibition of the mischievous activity. This sentiment, finding expression in one form or another, has played a very prominent part in religious life. Its awful implications seized hold of and goaded almost to misanthropic madness the impetuously emotional mind of Schopenhauer.

Deep down at the root of our being, where Kant had shown that our innermost nature, the intelligible, or, far more truly, the *volitional* Ego, issues with its power of free causation into manifest existence, morally to control and to overcome the baneful enchainment of natural events, into whose torturing meshes its own pernicious cupidity had entangled itself; there, at the root of our own and of all being, the blissful peace of eternal tranquillity

was ruthlessly broken and convulsed by that enormous guilt that brought in its train a world of endless suffering—the life-creating, malefic guilt that, with blind and frivolous desire, followed the treacherous allurements of temporal existence.

This is the central idea of the Monism of Will, the philosophical enunciation of which filled the life of that strange human being, who fretted through his allotted span of time under the name of Arthur Schopenhauer.

Hume was the first to draw prominent attention to one of the most significant of all contrasts, the one, namely, obtaining between the logical nexus connecting ideas, and the causal nexus connecting matters of fact. The former is purely analytical, the latter altogether synthetical. Kant made this all-important distinction the pivot of his entire philosophy. Before him all thinkers had proceeded according to the logical, analytical method. They endeavored to evolve the particulars of knowledge from a pre-existing, all-including totality. Kant set about constructing knowledge from the scattered and unconnected particulars given to sense by dint of definite combining powers, with which our mind finds itself endowed.

Kant, in spite of most strenuous efforts, could not see his way to a monistic system on this basis, for—and this is the emphatic conclusion of his entire theoretical philosophy—the combining faculties of our mind refuse to work on any kind of material which is not given through the senses. How this sense-material is actually given remains to Kant as enigmatical as to the philosophers of the seventeenth century, only their world of extended material things outside the mind has become to Kant a world of unknown things-in-themselves, and this through the discovery of the mental constitution of sensible qualities and of time and space.

Now, on the strength of Kant's assumption of a synthetical power of a purely mental or spiritual nature, our neo-Kantians, probably at present the most influential school of thinkers, are teaching a spiritual Monism, which generally goes by the name of Transcendental Idealism, but which is distinguished from Hegel's Transcendental Idealism by being synthetical instead of analytical. They simply deny that any sense-material is given from outside. All our conscious states, even the most elementary, are already through and through synthetical products, and form in every respect integral parts of one and the same unitary consciousness. And, as the combining and conscious power is of a mental or spiritual nature, it follows that the entire content of consciousness must necessarily be a product of that synthetizing power. Thought is then identical with being.

Truth or knowledge is the rethinking on our part of the eternal thought of the universal intelligence. And as thought is identical with being, it is clear that so far

as our thought has become identical with the divine thought, we have ourselves become divine beings.

This monistic system is incontestable, as soon as we admit that the only synthetizing power in the world is intelligence. But it is obvious enough that intelligence, as such, has not the very slightest power to originate and to endow with efficiency the forces that make up our real world.

Mr. Herbert Spencer, under the inspiration of the two great generalizations of our scientific era, the interconvertibility of forces and the evolution-hypothesis, has worked out with most comprehensive grasp, profound penetration and exquisitely subtle thought that great system of "Synthetic Philosophy," which we all so highly admire. Following with genuine philosophical zest the monistic bent, he has also attempted to crown the whole majestic structure by an all-comprehensive outlook, showing how the infinite variety of physical and mental phenomena forming our manifest world all issue from one single absolute power. According to this conception, all physical occurrences, as well as all mental states, are but so many different modes of this one Absolute.

Now, it is evident to Mr. Spencer himself that the only immediate knowledge we have of the physical world consists in mental states of our own. If, then, as Mr. Spencer teaches, these mental states are themselves really modes of the eternal power, on which they would then entirely depend, there is not the slightest reason why we should assume, moreover, another second source of dependence outside that power. We would then see all things directly in and through the only and infinite source of existence—this being exactly what Father Malebranche once taught. Our mental states, in all their diversity and complexity, including every kind of awareness of our own existence and nature, body and all, would then be nothing but passively-received flashes of revelation, coming to us from the impenetrable depth of the all-efficient but unknowable energy.

This is one of the ways of showing the utter untenability of Mr. Spencer's Monism of the Unknowable. There are other ways, which we will, however, not at present follow.

The truth is, our conscious states are in no wise modes of any infinite and eternal power, whether knowable or unknowable. They are simply that which science proves them to be, namely, very definite functions of a most specific organ—an organ minutely and accurately known by us in a symbolical manner within our own perception, but whose intimate nature as a thing-in-itself remains, thus far, entirely unknown. This is evidently the actual state of things. Why should we want to make it appear otherwise?

Professor Bain has likewise sought to establish a monistic view of matter and mind, and this within the

limits of the subjective idealism of the association-philosophy; a system of thought which, in its entire scope, he has elaborated with consummate psychological tact, extensive knowledge and admirable accuracy of observation and statement. With him matter and mind are only different expressions for objective and subjective consciousness, the former having extension, the latter being extensionless. The same being or substance is "by alternate fits object and subject," experiencing at one time extended, at another time unextended consciousness. We have, then, "one substance with two sets of properties, the physical and the mental—a double-faced unity."

As this two-sided monistic manifestation of many things and feelings takes place altogether within our own individual consciousness, we are naturally somewhat curious to know whether there are other double-faced beings in existence besides ourselves; also whether there are things outside our consciousness corresponding to its material perceptions. And, if so, we wish to gain some little insight how all these double and single-faced substances come in reality to be interdependent parts of one and the same world. Perhaps some one some day will inform us.

Materialism is ill adapted for monistic purposes. Its presupposition has to be dualistic. It must start either with ultimate elements of matter *and* force, or with ultimate quantities of mass *and* motion. When it transcends its realism, it becomes something quite different, something that generally goes by the name of Dynamism. We have, then, in existence only the reciprocal play of immaterial forces, usually conceived as a plenum of energies, irradiating from centers of power. On such a foundation, Priestley already sought to establish a monistic view of body and mind, and this by means of the very simple device of making mental efficiencies form part of the forces, that in their interaction constitute the world. Many thinkers have followed his example, and, of course, one cannot be much astonished to find individual power-complexes display mental properties when one has oneself introduced these very properties into their constituent elements.

The Brooklyn *Citizen*, after examining the official reports of the standing of the Roman Catholic church in this country, published in *Sadlier's Catholic Directory* for 1887, says:

Boston, the metropolitan see, to which the other two dioceses of Massachusetts are suffragan, has 400,000 Catholics. Truly is "the Boston of Collins and O'Brien" not "the city of Winthrop and the Puritans." Last year there were born there over eleven thousand children, and of this number over seven thousand were Catholics. "A steady annual growth of seven in eleven," says the Boston *Pilot*, "independent of the gain by immigration, will, in the course of one generation, make Boston the most distinctly Catholic city in the world."

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixon Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY.

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of THE OPEN COURT is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to THE OPEN COURT should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, MARCH 3, 1887.

DARWIN AND HIS WORK.

Charles Darwin, the great naturalist, died on Wednesday, April 19th, 1882, at his quiet home at Down, England. So retired was the life led by him, that not until two days after his death did the news reach the London papers, but everywhere, as soon as the sad fact was announced, there was a spontaneous outburst of loving regret from the people of every nation where his work was known. Rarely in the world's history has a man of science been so widely recognized during his lifetime, or so sincerely mourned at the time of his death. His own countrymen showed him all the honor possible, in a national way, by claiming for, and awarding him, a place among their immortals in Westminster Abbey, and among his coffin-bearers were the great scientists, Wallace, Hooker, Huxley, Lubbock, and others as distinguished.

Soon after his death the general desire to show

honor to his memory for his grand work of enlightenment found expression in a Darwin fund, to which came contributions from Austria, Belgium, Brazil, Denmark, France, Germany, Holland, Italy, Norway, Portugal, Russia, Spain, Sweden, Switzerland and the United States, in addition to what was given by his own nation and its colonies. A part of this large fund was used in the erection of a commemorative statue, while the surplus is held in trust by the Royal Society of Great Britain to be used in the promotion of biological research.

The statue, when completed, was unveiled in the great hall of the Natural History Rooms of the British Museum, on the 9th of June, 1885, the addresses being made by Prof. Huxley, in presentation, and by the Prince of Wales in acceptance for the Museum. It is recorded that on that occasion "around the statue were congregated the most representative men of every branch of culture, from the Prince of Wales and the Archbishop of Canterbury to the opposite extremes of radicalism and free thought. Indeed, it is not too much to say that there can scarcely ever have been an occasion on which so many illustrious men of opposite ways of thinking have met to express a common agreement upon a man to whom they felt that honor was due."

What were the services which commanded for this modest, unpretentious student this world-wide admiration and appreciation? He had, living, made no claims to superiority of intellect or knowledge; he was a man of domestic tastes, quiet habits and unassuming mode of life. He had never been prominent on public occasions, was rarely heard at great dinner parties; he cared nothing whatever for the world of fashion, was no authority on art, shone little in the phosphorescent light of *belles-lettres*. Huxley answers our question in his address in behalf of the Darwin Memorial Committee: "The causes of this wide outburst of emotion are not far to seek," he said. "We had lost one of those rare ministers and interpreters of nature whose names mark epochs in the advance of natural knowledge. For whatever be the ultimate verdict of posterity upon this or that opinion which Mr. Darwin propounded; whatever adumbrations or anticipations of his doctrines may be found in the writings of his predecessors, the broad fact remains that since the publication, and by reason of the publication, of 'The Origin of Species,' the fundamental conceptions and the aims of the students of living nature have been completely changed. From that work has sprung a great renewal, a true 'instauratio magna' of the zoological and botanical sciences. * * * The impulse thus given to scientific thought rapidly spread beyond the ordinarily recognized limits of biology. Psychology,

ethics, cosmology, were stirred to their foundation, and 'The Origin of Species' proved itself to be the fixed point which the general doctrine of evolution needed to move the world."

Intellectually, Darwin was of royal pedigree and family. His paternal grandfather, Dr. Erasmus Darwin, was one of the pioneer teachers of the theory of evolution long before his illustrious grandson was born; he was a thinker, philosopher and poet, author of "Zoönomia," "The Botanic Garden," "The Temple of Nature," and other works. His great-grandfather, Robert Darwin, is described in local records as "a person of curiosity," with "a taste for literature and science," and "an embryo geologist." His grand-uncle, Robert Darwin, was the author of a work on botany of considerable repute. His father, Robert Waring Darwin, was a physician of eminence at Shrewsbury and a Fellow of the Royal Society. His father's brother, Sir Francis Darwin, was noted as a keen observer of animals. Another uncle, Charles Darwin, who died at twenty-one, was author of a valuable medical work. His mother, who died while he was yet a child, was a daughter of the famous potter, Josiah Wedgewood, a careful and painstaking observer. Among his cousins, on the mother's side, were Hensleigh Wedgewood, the Philologist, Sir Henry Holland, and Francis Galton, the scientist and authority on heredity. His wife was a Miss Wedgewood, his cousin, and his sons are eminent in science.

But not wholly to pedigree or family predilections is the work and fame of Darwin due. That, in great part, is owing to rare personal qualifications—to his unswerving devotion to the study of Nature, to his phenomenal patience, to his careful observation, to his unwearied perseverance and continuity of purpose, to his generous recognition of fellow-students, to his genuine and rare modesty, and to his grandly simple rectitude of character.

Charles Robert Darwin—the Darwin of the Darwins—was born at Shrewsbury, England, February 12th, 1809. His family were in good circumstances, and no unpropitious "environments" hindered his natural bent toward scientific investigation. Family connections, neighborhood tendencies, and inherited proclivities combined to make him the fine character he was.

His scholastic education commenced at Shrewsbury, where, as a school-boy, "coming events cast their shadows before," in his delight in collecting shells, minerals, eggs, coins, etc., showing his bias toward investigation and classification. At sixteen he was sent to the University at Edinburgh, where one of his earliest papers, prepared for an Academical Society, was on "The Floating Eggs of the Common

Sea-Mat," setting forth his discovery of organs of locomotion in this low form of marine life.

From 1827 to 1831 he was a student at Christ College, Cambridge, where he was fortunate in having the companionship and guidance of such thinkers as Prof. Henslow, Airy, Sidgwick, Ramsay and others.

He was only twenty-two, an age at which most young men are busy "sowing their wild oats," when the chance of accompanying Capt. Fitzroy, on the government ship *Beagle*, on a voyage of scientific discovery round the world, was presented to him. Though he understood that the trip would be of several years duration, and might be in some respects dangerous; though his services were to be gratuitous (with the privilege only of retaining as his own the specimens collected on the trip), yet he eagerly accepted the opportunity; and his five years of exile from home and friends were years of delight to his soul, and during those years was laid the foundation of all his noble after-work of discovery and experiment. His work as a writer began when, after his return, he contributed three volumes to the series recording the observations made during the voyage of the *Beagle*—"Volcanic Islands," "Geological Observations on South America," and his valuable Essay on "Coral Reefs."

Three years after his return, at the age of thirty, he married a cousin, Miss Emma Wedgewood, daughter of his uncle Josiah Wedgewood. Within a few years of his marriage he built his family mansion at Down and instituted the beginnings of his series of practical experiments, the results of which, when long afterward presented to the public in his "Origin of Species," were accepted as indisputable testimony to the truth of what had been until then held as theory only, but which, when thus fortified, was accepted by the world at large, as well as by brother scientists, as incontrovertible and demonstrated truth.

He gave the best years of his life to these experiments, forsaking for them all public emoluments and honors, and all other pursuits. "Early to bed and early to rise; wandering unseen among the lanes and paths, or riding slowly on his favorite black cob, the great Naturalist passed forty years happily and usefully at Down, where all the village knew and loved him," wrote Grant Allen; yet, every day probably, in all these years, he was, with deliberation, with careful exactness and thoughtful judgment, making experiments of all kinds with plants, insects, birds and animals; browsing in all the highways and byways of literature and ferreting out the secrets of individual experience for facts bearing on the subjects in mind; trying in every thinkable way to test the accuracy of his biological surmises. His admiring

and admirable friend and scientific compeer, Alfred R. Wallace, says, on this point, that soon after his return from his memorable Beagle voyage "he had already perceived that no explanation but some form of the derivation or development hypothesis, as it was then termed, would adequately explain the remarkable facts of distribution and geological succession which he had observed during his voyage, yet he tells us that he worked on for five years before he allowed himself to speculate on the subject, and then, having formulated his provisional hypothesis in a definite shape during the next two years, he devoted fifteen years or more to continuous observation, experiment and literary research, before he gave to the astonished scientific world an abstract of his theory in all its wide-embracing scope and vast array of evidence in his epoch-making volume, "The Origin of Species." If we add to the period enumerated above, the five years of observation and study during the voyage, we find that this work was the outcome of *twenty-nine* years of continuous thought and labor by one of the most patient, most truth-loving and most acute intellects of our age."

Alfred Russell Wallace, with a modesty characteristic of both himself and Darwin, omits to state, in the sketch from which the foregoing paragraph is taken, that the publication of the "Origin of Species" was hastened because of a striking memoir which he (then absent on a voyage of tropical discovery) had sent on to Darwin in 1858, with a request that he forward it to Sir Charles Lyell for presentation to the Linnean Society. To Darwin's surprise he found, on reading it, that it contained his own theory of natural selection, not worked out in detail as he himself was working it out, but still complete in spirit and essence. Sir Charles Lyell and Sir Joseph Hooker, who were aware of Darwin's own unpublished work, both urged him to publish a few extracts from that work in the same journal in which Wallace's paper was to appear, and the two contributions were read together before the Linnean Society, July 1, 1858. "That double communication" says Grant Allen, "marks the date of the birth of modern evolutionism." Darwin decided that it was time to give to the world some of the results of his experiments with his conclusions in regard to them and "The Origin of Species" was published in November of the following year, 1859. Says the writer last quoted from, "that book was one of the greatest, the most learned, the most lucid, the most logical, the most crushing, the most conclusive that the world has ever yet seen. Step by step, and principle by principle, it proved every point in its progress triumphantly before it went on to demonstrate the next."

The work excited immediate attention and

aroused hot discussion, and in less than six weeks after its publication was in such demand that it had become famous and a second edition was called for and put upon the market. Darwin was over fifty when "The Origin of Species" was published. It was to have been one of a long series which he contemplated, but ill health prevented him from finishing that series to his own satisfaction before his death, at the age of seventy-three, though doubtless the most important ones were given to the public, since other scientists, by their work in the same direction, filled up the gap thus left. In spite of his constant work and study Darwin was for a great part of his life a semi-invalid, but he made every moment of available time of purpose to science. Among the works published by him were "The Descent of Man," which awoke still further opposition and discussion from orthodox thinkers, though the battle had been in effect won by the earlier work, "The Variation of Animals and Plants Under Domestication," "Emotional Expressions of Man and the Lower Animals," "Insectivorous Plants," "Fertilization of Orchids," "Movement and Habits of Climbing Plants," "The Effect of Cross and Self Fertilization," "Power of Movement in Plants," and "The Formation of Vegetable Mould Through the Action of Worms." In regard to this last work it may be noted as an instance of his remarkably painstaking experimenting, that having early had his attention called to the subject, from a suggestion from his father-in-law, Josiah Wedgewood, soon after he built his family mansion at Down, in 1842, he began to spread broken chalk over a certain field, which he let remain undisturbed to the action of earth-worms until 1871, when a trench was dug to test the results, an experiment taking twenty-nine years!

His experiments were never absent from his thoughts. In his garden and his conservatory some of these were ever in progress. Col. Higginson tells us how, on a certain visit to Darwin, when he remained over night, he happened to look out of his window very early in the morning and "seeing him hurrying in from the remoter part of the green garden with a great shawl wrapped around his head, his white hair and beard emerging from it—a singularly unconscious, absorbed, eager figure. I asked his son afterward what his father was out there at that time in the morning for in his impaired condition of health? 'O, yes,' said his son, 'he is always at it. He always says he is not doing anything at all. But he always has one of his little experiments, as he calls them, going on out there in the garden, and he has to look at them two or three times every night.'"

Every one who ever met the great Naturalist—lofty and noble in figure, as in mind—bears testimony

to his lovable qualities. "To that charming candor and delightful unostentatiousness which everybody must have noticed in his published writings," says Mr. Allen, "he united, in private life, a kindness of disposition, a width of sympathy, and a ready generosity which made him as much beloved by his friends as he was admired and respected by all Europe." No one was so much surprised at the honors shown him as himself. John Fiske says: "When I first met Mr. Darwin in London, in 1873, he told me that he was surprised at the great fame which his book instantly won, and at the quickness with which it carried conviction to the minds of all the men on whose opinions he set the most value."

He mingled little in general society, but enjoyed the personal acquaintance and friendship of most of the leading scientific men of Europe and this country. Two or three years of his earlier married life were spent in London, and we read of him at this period in the Carlyle reminiscences as dropping in of an evening for a friendly chat with Mrs. Carlyle, or of her taking a drive with him to see his new house at Down, and again of Carlyle being absent "at dinner at Darwins," etc. He was not at all a self-assertive, self-conscious man or Scientist, but only a sincere lover of science, and an ardent investigator of the ever-tempting, tantalizing and beckoning promises of revelation of the wonderful mysteries of the Universe. His grandfather's words in his poem, "The Temple of Nature," might have been his own invocation.

"Priestess of Nature! while with pious awe
Thy votary bends, the mystic veil withdraw;
Charm after charm, succession bright, display,
And give the goddess to adoring day!"

S. A. U.

SCIENCE vs. THEOLOGY.

Science emphasizes the importance of investigation. It says investigate and then believe or disbelieve according to the weight of evidence. Theology says, believe first and then investigate if you choose, but be careful that investigation does not weaken your faith. Science teaches that doubt is necessary to inquiry and that inquiry is necessary to intellectual progress. Theology, by condemning doubt, discourages impartial search for truth and, at the same time, courage and independence of thought. The faith of the man of science is conviction founded upon evidence. Theological faith does not admit of proof or verification. The authorities of science are those who have made their subjects matters of years of laborious study; yet an appeal from their statements is always open to any one who can show their error or inadequacy. The authorities of theology are ancient characters who are held in veneration on account

of their alleged inspiration, and appeal from whose declaration is pronounced sinful and perilous.

The object of science is Nature—the world of phenomena, whose ongoings are open to our observation and contemplation. The object of theology is the supposed attributes, plans and purposes of the unknown cause of phenomena. Science is knowledge classified and methodized. For convenience we label a certain class of facts astronomy, geology, chemistry, biology, etc., but all these sciences are but segments of a circle, parts of one great science—the science of the universe. All the sciences being related, there can be no complete knowledge of any without thorough knowledge of all.

When we go beyond the region of observation and experience, and beyond the possibility of data for our beliefs, we pass from the region of science to that of theology. Theology begins where knowledge ends. The empire of science is continually enlarging, while that of theology is yielding its territory just as fast as the complex groups of phenomena in which it entrenches itself are shown by scientific discoveries to belong to the region of law and causation. Miracles, like ghosts, vanish as the light approaches. Theology is retreating from field to field, and is now pleading for the right to recognition as the science of that which is beyond phenomena—the light that never was on land or sea. The various conceptions of the eternal mystery in regard to which theology dogmatizes are but so many mirrors from which men see reflected their own mental and moral faces. Man projects ideally his own intelligence and volition out upon the field of phenomena and imagines that he is studying the plans and purposes of God, when he is unconsciously studying his own nature. This illusion is the foundation of theology which, carefully analyzed, reveals not the plans and purposes of Infinite Intelligence, but the conceptions and feelings of man, formulated into dogmas and made realizable to the ignorant by ritualisms which appeal to eye and ear. The key to theology is anthropology, because the actual object of theology is a conceptual being entirely human in its intellectual and moral characteristics. The existence of that power in which we move and live, which rounds a pebble and forms a planet, which germinates a seed and evolves an animal, even the wonderful structure and yet more wonderful mind of man, is indubitable, though one declines to limit it by definitions or to give it human attributes.

Science shows that the present order of things is the product of the modification of pre-existent orders. All leading scientific thinkers regard evolution so well established as not likely to be shaken in its main conclusion. From simple conditions has grown a world diversified in appearance and teeming with differentiated life. The higher forms have a genetic kinship with lower forms. As structural modifications have resulted in the body, so

mental modifications have resulted in the mind of man. Language, government, art, morals and religion have grown from the most rudimentary conditions. Judaism and Christianity can be shown to have grown out of earlier religious systems. Christianity gained its great conquests only when it had assimilated much of the Paganism with which it was confronted, and it persists to-day only because, ignoring those portions of the New Testament teachings which are ascetic, or impracticable in this age, it adopts the maxims and conforms to the requirements of our modern industrial civilization.

Fortunately moral character and conduct do not depend upon theological dogmas. Ethics is the science of human relations. The moral law is a generalized expression for the sum total of actions conducive to our well-being. The moral sense is no doubt innate, but it is an implication of evolution that innate or connate tendencies are the acquisitions of centuries, the experiences of ancestors organized in the race in the form of predispositions; so that instincts and intuitions, and even the old metaphysical *a priori* "forms of thought," are experiential in their nature—*a priori* in the individual but experiential in the race.

Modern science, in a truly reconciliative spirit, fuses into a synthesis whatever valuable there is in the old conceptions with the newly-discovered truth, and it is equally opposed to the dogmatism of theology on the one hand and to mere iconoclasm on the other. It destroys only to rebuild, only to get possession of the ground; and it would preserve whatever valuable materials there are in the old structure, for use in the erection of a fairer and nobler edifice for humanity.

In an article giving "A Thought-Reader's Experiences," in the December number of the *Nineteenth Century*, Stuart Cumberland, the most celebrated of the so-called mind-readers, says that in his experiments he is always blindfolded so that his attention may not be distracted by light or movement, that in working out actions, such as imaginary murder tableaux, he prefers holding the patient's hand in his own, "so that all the nerves and muscles may have full play." He never, he says, gets a "mental picture" of what is in the subject's mind and depends wholly upon impressions conveyed to him through the action of the subject's physical system while his attention is concentrated. Mr. Cumberland states that he has never seen a successful experiment of reading thoughts without contact, "unless there had been opportunities for observing some phase of physical indication expressed by the subject, or unless the operator was enabled to gather information from suggestions unconsciously let fall by somebody around. I have on several occasions managed to accomplish tests without actual contact, but have always been sufficiently

near to my subject to receive from him—and to act upon accordingly—any impression that he physically might convey." "In my case," he adds, "thought-reading is an exalted perception of touch. Given contact with an honest, thoughtful man, I can ascertain the locality he is thinking of, the object he has decided upon, the course he wishes to pursue, or the number he desires me to decipher, almost as confidently as though I had received verbal communication from him.

* * *

David A. Wasson, who died in Medford, Mass., in January, after a long and painful struggle with disease—the result of an injury to his spine sustained many years ago—was a philosophical thinker, a poet and a man of exalted character. His papers, contributed to the *Atlantic Monthly*, the *North American Review*, *The Index* and other publications, are all marked by vigor and originality of thought, an earnest and conscientious spirit and fine literary taste, and many of them are worthy of collection and reproduction in permanent form. Hampered though he was by physical infirmities, which increased year by year, whatever he wrote bore the stamp of the thinker and the artist. No one who knew him well can forget the charm of his personality, and none familiar with his writings, who know under what painful disadvantages most of them were produced, can fail to feel a deep and pathetic interest in his philosophical and literary work.

* * *

The papers announce that Mr. Beecher is now at work on his *Life of Christ*, that after its completion he will write his own life and that then the two works will be sold together by subscription. The *Springfield Republican* gives the publisher a hint as to the heading of their announcement, thus: "The Lives of Christ & Beecher, by the Latter." The *Republican* mentions that Rev. E. F. Burr, author of "*Ecce Calum*," dedicated one of his books to President Scelye, of Amherst College, and another to the Supreme Being.

* * *

In a tribute to her husband, whose death was announced a few weeks ago, Elizabeth Cady Stanton gives this illustration of Mr. H. B. Stanton's readiness, when addressing an audience, to take advantage of any unexpected occurrence:

On one occasion he was delivering a temperance lecture on the platform covered by a thick oil-cloth that protruded two or three inches over the edge of the boards in front. In the midst of one of his most eloquent passages he was comparing the inebriate's downward course to the Falls of Niagara, and the struggle with drink to the hopeless efforts of a man in the rapids. Just as he reached, in his description, the fatal plunge over the precipice, he advanced to the edge of the platform, the oil cloth gave way under his feet and in an instant he went down headlong into the audience, carrying with him desk, glass, pitcher and water. Being

light and agile, he was quickly on the platform again, and immediately remarked with great coolness: "I carried my illustration farther than I had intended to. Yet even so it is that the drunkard falls, glass in hand, carrying destruction with him. But not so readily does he rise again from the terrible depths into which he has precipitated himself." The whole house cheered again and again, and even Gough never struck a more powerful blow for temperance.

* * *

A lady relates this of her servant, a spinster about forty years old, who had a settled aversion to the male portion of mankind: "One day she asked for my library ticket to go to our village library for a book to read. I recommended two or three books which I thought she would find within her capacity, but she found that they were all out and she choose a book for herself. It was Darwin's 'Descent of Man.' 'Why did you pick out this book, Biddy?' I asked her, in surprise. 'Sure, ma'am,' she replied, 'it says its about a daycent man, and if there's one daycent man top of ground I thought I'd like to be radin' about him; but it ain't about any man at all, ma'am; its all about mon-keys, sure.'"

* * *

Dr. Edmund Montgomery writes:

I perfectly agree with Mr. Hegeler that living faith in the unbroken continuity of organic "form" and conscious participation in its further development, have to become the positive and central inspirations of the scientific creed. It is this fact of nature which is really the superindividual, realistic basis of the unity of mankind and of all its social and ethical striving. The mystery of love in all its phases arises from the fundamental organic unity—a unity rendered wondrously mystic and magnetic through the estrangement of individuated personality. Every one so isolated and yet so completely one with all the rest. The ready self-sacrifice for Love's sake, and especially the joyous sacrifice of parents, attest sufficiently how deeply and instinctively rooted this feeling of organic unity really is. Being universal among unperturbed classes of humanity, it affords an organized, impressible and altruistic medium for the emotional reception of the scientific creed. But as the same nature-rooted sentiment has been falsely interpreted by supernatural and anti-social theories of life, it devolves upon science to give it a solid, incontestable basis in vital organization.

* * *

The Century Magazine prints for the first time the words of Abraham Lincoln given in an official reprimand to a young officer who had been court-martialed for quarreling: "Yield larger things to which you can show no more than equal right, and yield lesser ones, though clearly your own. Better give your path to a dog than be bitten by him in contesting for the right. Even killing the dog would not cure the bite." This is not, in our opinion, sound moral teaching. It would never develop strength of character nor promote a strong sentiment of justice among men, with respect for the right of one another. The man who voluntarily allows others to impose upon him encourages imposition. The man who submits to

injustice to himself, when he can prevent it, encourages injustice to others, and, however amiable his disposition or good his intentions, his conduct weakens the safeguards of social order. The truly just man respects the rights of his fellow men, and insists upon his own. "The killing of the dog would not cure the bite," but it would prevent his biting some other person less able, perhaps, to escape or to defend himself.

* * *

Auberon Herbert, in *A Politician in Trouble About His Soul*, says of Herbert Spencer:

With the most faithful appreciation of scientific work, he has seen that the world belonged neither to the physicist, nor to the chemist, nor to the biologist; but that it was something larger than any world of theirs. He has seen, as Carlyle, and Emerson, and Ruskin, and Walt Whitman have seen, each in his own way, the wonder and the miracle in which we are all enveloped—the marvel of the knowable world and the marvel of the unknowable world, lying beyond the enchanted mountains and their impassable barrier; he has looked through the nature that surrounds us to the meaning at the heart of it all; he has used science as the interpreter of the sacred thing, but not stayed in it, as if it were the sacred thing itself. We owe it to him more than to any man—unless, perhaps, it be Emerson—the power to realize the harmony and unity embracing all things, the perfect order and the perfect reason, in the light of which men may walk confidently with sure aims. We owe to him new possibilities of that faith, of which the theologian, with his combined pettiness and rashness, has almost robbed the world.

THE following notice of THE OPEN COURT is from the editorial columns of the Boston *Herald* of Feb. 24:

THE OPEN COURT, which takes the place of the *Index* and is now published at Chicago as a fortnightly, is a great improvement on that rather unequal journal and brings to the front, with their affirmations of positive thought, the principal radical thinkers of the country. There is a welcome field for such a paper, though its home would seem to be in the East rather than in the West. But one is too happy to have such a paper in existence to be too critical as to the quarter of the country in which it appears. Many of the old stand-bys are here in their proper place, but one recognizes a more philosophical tone of thought, a more constructive view of life, a stronger grip on things essential. This is to be encouraged. An objection to much that is called new thought is that it is nothing but articulated nonsense. THE OPEN COURT in its initial issue is comparatively free from this sort of utterance. There is not an article in it which a thinking man can afford to skip and if the periodical can be maintained at its present level it will speedily become one of the influential papers of the United States in all that pertains to vital thinking. It will be an honor to any man to reach the public through its columns.

* * *

Mr. Zimmerman's speech in the last issue of THE OPEN COURT was the only part of the discussion of Mr. Hegeler's essay that was printed from the stenographer's notes without revision or correction, and it contains some errors which in justice to Mr. Zimmerman should be indicated. In the fifth line for "those for" read *these few*; in the seventh line instead of "can" read *again*. In the eighth line after "until" read *at last*, and after "vigor" omit "falls under" and substitute *feels no invigorating*.

UNITARIANISM AND ITS GRAND-CHILDREN.

BY MONCURE D. CONWAY.

In the statistics, Unitarianism appears one of the smaller sects. In reality, it is the largest. The fallacy arises from the fact that Unitarianism is not viviparous, does not bring forth its young alive; it is oviparous, and most of its eggs, like those of the cuckoo, are hatched in other nests than its own. The bad name of the cuckoo comes from the European species, which shove other eggs out of the nests they invade before depositing their own. The American cuckoo respects the brood of other birds, and leaves its child to be brought up with them, and for a time be confused with them. When the broader wing develops in the Congregational nest, or the Episcopal, or the Quaker nest, there is a good deal of fluttering and scolding among the parent birds; but the new creature is strong, not easily pitched out, and is gradually adopted as one of the family. If Unitarianism recognized all its children in other churches, and outside of all churches, it would feel patriarchal as Abraham, the father of generations. The late Dean Stanley said that, while he was in America, every sermon he preached had some of Channing in it, and every sermon he heard was largely from Emerson. Yet he did not attend any Unitarian Church. Channing is a Unitarian father; Emerson one of his children, Theodore Parker another. These two children were from eggs laid in the nest once called "infidel;" they were repudiated, but are now objects of parental pride. Then Parker and Emerson found nests in which to lay their young. Transcendentalism and Parkerism, children of Unitarianism, gave birth to the germs of new departures. The Free Religious Association, the Ethical Society Union, the Agnostic philosophy, are thus grandchildren of Unitarianism. If all who are really of one blood could be gathered together, a great force might be generated. There is a growing tendency in the old household of liberal faith to build for itself a larger mansion; so that its grandchildren may mingle with its children, and not merely come for an occasional visit, but stay for a long time. On the other hand, some of us fear that the homestead is not large enough for a house that can include all the liberal family. We know that, whether beside Tiberias or Winnepesaukee, such houses of the true and free cannot be made with hands; and suspect that it might even be better if Unitarianism were to give up denominational housekeeping altogether and live on its children and grandchildren, who would be all the better for its culture and experience.

Thirty-five years ago I came from an orthodox church into the Unitarian Church to find it hotly militant. Many besides myself must look back on those

old disputes with sorrowful wonder. The polemical spirit of those days has passed away before a discovery which has changed every thinker's point of view. We are now evolutionists. We regard each other not as soldiers of one or another camp, but as minds representing various stages of development—buds or blossoms, or fruits more or less ripe, to be dealt with not by bruises but sunshine. We have also learned two other things: 1. That the persistence or decline of doctrines depends much less than we used to think on their truth or untruth. The world is fashioned by evolutionary forces. Even an untrue dogma may survive so long as it produces the man valued by society and helps the average world better than the truth. 2. We have learned that dogmas may not be what they seem, and that where any faith bears sweet fruit, loveliness of life, charity to all, the mere orthodox name does not alter the organic truth of that faith any more than it would affect the character of a peach tree if you should label it prickly pear. He that deviseth liberal things is liberal, whether he can rightly analyze his liberalism or not.

The controversial method is thus discredited. Our zeal is transferred from the abstract to the practical side of our truth. To propagate a doctrine means to make it a factor in human evolution. The more we fight for it the less we advance it, for the man we fight is the man we have got to enlighten. And if we cannot show in ourselves, in our families, in our societies, better types of character than his, we cannot by any reasoning touch the spring that moves that man—who is average mankind, organized through ages by ecclesiastical selection, but moralized by social selection.

The defect of most liberal organizations arises from the fact that they were pre-Darwinian. Positivism, with its elaborate scheme for a Church of Humanity, already, in its second generation, appears antiquated. Transcendentalism included the idea of development, but it was based on the optimistic view of nature; the law of evolution reveals nature "red in tooth and claw," dependent on man for restraint and direction. The Free Religious Association was a Declaration of Independence, and it was followed by a sort of confederation for the security of individualism rather than for co-operation. The union of societies for ethical culture, formed this year in New York, is the only liberal organization constituted since the revolution in the aims and methods of progress caused by study of the laws of evolution. We may, in a sense, call that ethical movement the great-grandchild of Unitarianism.

Nearly every Unitarian feels that he is able to keep abreast of most movements. He has no creed to keep him from being a Free Religious Associate, a transcendentalist, a rationalist, an ethical culturist, an agnostic even. And yet these new departures have had to develop themselves outside of Unitarianism. Somehow

they have not found the ancestral atmosphere congenial to a farther religious and ethical evolution. Is there any necessary cause behind this fact?

What are the aims of a liberal Church? Its primary aim is to cultivate the whole higher nature of every individual it can reach. This is a great task. Every soul is dogged through life by its hereditary animal; to restrain that animal, tame it, domesticate it, and harmonize it with the higher purposes of life, is a work requiring the finest art and profound science. The good shepherd of the new age, unable to frighten the wolf from his educated flock with incredible hells, nor bribe it with a upine paradise, must, nevertheless, alarm animalism with the actual consequences of evil, and invest virtue with her every charm, that the sense of honor may grow strong enough to subdue every degrading tendency. For that work the Unitarian society seems fairly constituted. It holds two great doctrines which fit it for such ethical service—the dignity of human nature, and the salvation of every man by his own merits. A generation thoroughly trained on those two principles would be a virtuous generation.

I heard Emerson say—it was more than thirty years ago—"I do not hear the preacher, but gladly help in his support; it is important to have in town a man occupied with its humanities." I could not help feeling that something must be wrong, or else he himself would be still the great preacher in his ancestral church. The three greatest intellects of our own time—Emerson, Darwin, Carlyle—were all trained for the pulpit; but neither found it adequate for his large aim. It might do for "the humanities," but not for humanity. And this brings us to consider another aim of every liberal church. It must have some mission to the world. It must not merely cultivate individual natures for personal happiness, domestic life, or the social circle; it must influence the state, the world, the conditions under which society is evolved, the forces by which humanity is fashioned. Self-culture is but a variety of selfishness unless it is humanized. Science studies all things impartially; morality distinguishes the good from the evil; but religion means to fall in love with the good. To seek it everywhere, to make sacrifices for it, to demand the whole world for it, is as essential to rational religion now as it was to those who, of old, gave their lives joyfully in hope of a renovated earth.

Jesus was an evolutionist. The travail of his soul was a purified and renewed earth. It was to be brought about by human toil as a harvest. A small seed fed and watered till as a tree it fills the earth, was the similitude of his faith. But his truth fell amid briars of superstition; it was choked as it sprang up. When he died and appeared no more among men, his followers located his new earth beyond the clouds, where they supposed he had gone; they lavished their enthusiasm and their sacri-

fices on another world, and abandoned this to its supposed diabolical ruler. The aim of the living Jesus was thus overthrown by the phantom of a risen Christ. After its long slumber of centuries the idea of Jesus has awakened, in our own time; again there rises before religious faith the vision of a renovated world to be secured by human effort. The dream of immortality remains, but the rosy heaven which so long absorbed religious enthusiasm is steadily superseded by the hope that this great lump of earth is to be leavened with truth, and justice, and beauty; and by the belief that it is to be brought about by the labors of man.

Yes, in our own age, for the first time since Jesus went silent, has the cry of the poor been heard by religion, and the salvation of man from actual evils become the supreme end of any church. Good men in many churches have indeed heard that cry, churches have adopted their charities; but Christianity never promised the salvation of this world from the evils which afflict and degrade it, never proposed to exterminate pauperism, disease, despotism, never threw itself on the side of any cause that concerned man simply in his earthly condition. It was heresy to deal with human sufferings as not included in the providence of God; it was sacrilege to devote to man any treasures consecrated to God. If that providence had done for man as much as man has done for him, every human desert would be blossoming like the rose.

If now once more the brave voice of Paul, warning the Athenians that God needs nothing at all at men's hands, is heard, we owe it primarily to the Unitarian movement. The germ of a human religion was planted when reverence ceased to believe that man's chief end was to glorify God, to pay God for dying for him, to sound his praises for the surprising mercy of not damning the whole human race to all eternity. Unitarianism proclaimed a new God and a new man; that implied presently a new heaven; that again a new earth.

But every new divinity must for a time propitiate the preceding one. The old forms and phrases are used, though with new meanings, and there is apt to be a sort of compromise—a father-and-son arrangement. By that means Christianity inherited the temples of Paganism, and by a like process Unitarianism inherited the temples of Puritanism. The father generally holds a mortgage on the estate of the son, but when the grandson comes the continuity becomes strained. For this third person is the spirit which finds the letter a burdensome heritage. The living spirit is sharper than a two-edged sword; it is always a divider. It questions the forms which the new faith has derived from the old. And that is the spirit which is searching Unitarianism to find whether it is able to meet the demand it has awakened—to deal with the social, moral, national, human questions which have supplanted theology. Fifty years ago Unitarianism

gave up from its pulpit the noblest genius this country ever produced, because he could not celebrate the sacramental symbol of a dogma which Unitarianism had taught him to repudiate; yet fifty-five years ago that same preacher, Emerson, was able to bring an humble abolitionist from Boston common into his pulpit, from which, for the first time, the slave's cause was heard by people of wealth and influence. And during all that struggle for humanity the Unitarian, alone among churches, had a witness for justice in every community and, above its official hesitations, wrote in faithful and fearless pulpits a record of which it need not be ashamed.

Fifty years is a long time. It is probable that in most Unitarian congregations a preacher's eloquence would outweigh his dissent from their theology and disuse of any sacrament. But, in the presence of great issues affecting humanity, men whose hearts burn within them lose their interest in theology, in ceremonies; the ritual solemnities become literally impertinent. The adequacy of a church to the issues of its time is solely a question of whether that church is able to attract to itself the moral genius of its time. And that no church can do without being the very best organ through which moral genius can influence the fine issues for which it is finely touched. Is Unitarianism drawing to itself and giving free course to the moral genius of its time? Yes, in one sense; no, in another. Yes, if its children and grandchildren be reckoned with it, and its sons who have carried its thunder into certain orthodox churches. Sydney Smith once wrote to a friend: "I preached a sermon this morning on peace, as good as any of Dr. Channing's; in fact it was Dr. Channing's." The like may be said of many sermons now charming Boston and New York, only they are somewhat more heretical than Channing's; for the meal may be bear's meat if the grace is liturgical. When some one spoke of the apparent decline of Unitarianism, Dr. Bellows said a better phrase were the decline of apparent Unitarianism. The suggestion seems still true.

Whatever may be thought of the Unitarianism which is leavening churches called orthodox, I cannot help feeling that the societies which have no theological tests ought to be able to form a unity so complete, a fraternity so free, a ministration so various, that the religious genius now starved in uncongenial professions shall be recalled. Very slight modifications of structure may be followed by vast changes of function; a grain-weight of bone may make all the difference between the earth-bound and the heaven-soaring creature; and it may be that some small changes might make Unitarianism into the real American Church.

Simply to drop the name Unitarian might have great results. The question of the Trinity is now of only infinitesimal importance. What serious person is willing

to sever himself from his ancestral church on so paltry a question as whether the deity exists in three persons or one? People are concerned now to know whether there be any God at all or not, but whether he has three persons or three or three thousand, is of no importance whatever. That battle-field is cold. The Unitarian surrendered the whole thing with the authority of the Bible. If the Bible is not God's Word, what it teaches about his personality is of mere literary interest. For reason or science there can be no such question. The man who believes God has several persons, or a million, has as much fact to support him as the man who says he has one, since, apart from "revelation," neither knows anything at all about it. The Unitarian name is an anachronism, and, I suspect, is kept up from loyalty to the fathers and a lingering militantism.

But more, the Unitarian name, arrogant toward orthodoxy—as if alleging that it does not hold the divine unity, a sort of "bloody shirt" waved in its face—on the other hand misrepresents the thinkers so labeled. It obstinately suggests that they are devoting their lives, their scholarship, their freedom and power, to a small theological negation. So long as people can hear preached in Trinitarian churches, as they do, the fatherly tenderness of God once distinctive of Unitarian doctrine, the humanity of Jesus, the sacredness of man, they will not care for the mystical word with which such realities are connected. And if it be said that such preaching in orthodox churches is dishonest, the Trinitarian may ask whether it be any more honest for those who affirm the Universal Love to prompt that love with prayers; or for those who reject the vicarious atonement to still consecrate the blood of Jesus?

However, names are difficult things to deal with; they get into trust deeds, and bind the living to bury the dead. Therefore, the only way to get rid of such a misnomer as "Unitarian," is to earn the right characteristic name, to work up to it, live up to it, until the world can read the true name on their forehead, as they read "Quaker" on the brow of George Fox and "Methodist" on that of Wesley.

The ear of the world has never been caught but by some gospel of salvation. But from what can a Unitarian save the world? He cannot aspire to convince the world of the truth of a theological creed, for he has none; he cannot propose to save the world from hells and devils that do not exist. From what, then, can he save it? The world is daily teaching us how and from what it must be saved. Outside of the churches—alas! outside—societies are formed to confront the manifold evils of the world—temperance societies, purity societies, woman's rights, man's rights, anti-capital, socialistic leagues. Each a satire on the churches, and each a rough-hewn stone in the church of the future—the Church of Man. They are rough, these movements,

out of proportion, stumbling-blocks to the refined and reasonable, because they are detached from the centers of religious sentiment and culture, which alone might shape and polish them.

But who is equal to these things? Religion has so long been occupied with making poor God comfortable, and pleased with himself, that we have no training for these social and moral issues. A poet says "new occasions teach new duties," but they do not teach us how to fulfil them. The Bible having ceased to be a guide, because it requires casuistry to make it out a moral book, we have been left to the laws of nature; and now find nature even less moral than the Bible. The anxious mother asks her liberal pastor: "Will you please give me a reason for my son why he should not gamble?" "Well, we didn't study that subject at the divinity school." "Or," she proceeds, "perhaps you will give me an answer for my daughter who, after hearing your beautiful sermon on God as revealed in nature, asked whether we should follow our nature." "Ah, Madame, that is a difficult question. I must look it up some day. By the way, how did you like my view of agnosticism last Sunday?"

When our good minister goes out into the world he is even more helpless. There he finds capital entrenched in the natural law of supply and demand, and labor hurling at it the equally natural stone with which conservation of force supplies its hand. The Golden Rule is transformed to the Rule of Gold. It is the struggle for existence. The millionaire cannot exist without his million any more than the workman without more wages. Steadily rises the storm. They used to tell us in the anti-slavery agitation that God would end the wrong in his own good time; but when it was ended that way, so much hell-fire was brought to the work, that it looks as if it might have been better to do the work ourselves. If the people had been as fully instructed by their pulpits in the moral facts of their own country, as in those of ancient Judea, there would have been no slavery and no war. And as one sees an anarchist nation steadily forming in hostility to the existing nation, while its moral guides are exhuming Jerusalem or speculating on the unseen world, a shuddering fear arises lest what we are witnessing should turn out to be the reversion of a race to barbarism. What corruption in great corporations, what baseness in politics! With what cynical hypocrisy is the polygamy of Utah outlawed in such ingenious terms as to leave unrestrained the baser polygamy of our cities, which leaves its victims without respect or shelter! What rebuke of this do we hear? Where is any Sinai? Among all the exhausted craters I see but one summit beginning to dart out the sacred flame. The movement which in largeness, freedom, influence, may claim to be successor to that of Channing, of Parker, of

Emerson, is one in New York, which is trying to found religion on pure morality—on the actual salvation of man. The moral ignorance of educated people is a necessary result of the long confusion of morality with theology. A learned and veteran Unitarian minister has lately stated that we liberals are all living morally on elements bequeathed from orthodoxy to our atmosphere. I fear there is a good deal of truth in that. It may account for the feebleness of our protest against the combination of churches to defy constitutional rights of conscience and establish their average theology, their Sabbath, their bible in every State; and, by exempting their church property from taxation, tax every man so far for their support. It accounts for the fact that Bible societies go on circulating a Bible containing thousands of admitted errors, while one in which most of them are corrected is at hand. That deliberate circulation of exposed falsities as the Word of God could not continue if the liberal teachers of this country were not infected by an atmosphere inherited from ages of pious fraud.

I do not mean to intimate that these orthodox men are not good men. But they are under the epoch of religious militantism. We know the duty of soldiers.

"Theirs not to reason why,
Theirs but to do and die."

The captain who, in private life, would scorn untruth, on the battle-field will deceive his foe by every stratagem. For himself he would not harm a fly; for his flag he will kill thousands of men. So have many tender-hearted men, enlisted as soldiers of the church militant, slain and burnt those whom they regarded as enemies of Christ; and, now that holy massacres of heretics are out of date, they resort to deception and stratagem. But it is all to win souls for Christ. It is to save human beings from a fearful doom. "E'en their vices lean to virtue's side." They are zealous to save men from a fictitious hell. I wish we were all as zealous in saving men from real hells. When the Christian soldier lays aside his armour you have a kindly, honest, moral man. He will vote with his theological antagonist for the right thing. If we could only get all the good moral men who make such sacrifices for their theologic flag—even sacrifices of veracity and charity—to set our common cause, the salvation of man from moral and social evil, above their creed, above the ceremonial service of God, the millennium might cease to be a mere dream. Men cannot thoroughly serve two masters. So long as they believe in a deity who needs something at men's hands, that service will be the supreme thing.

Positive begets negative. The militantism of the church produces an antagonist militantism. So long as the barbarous laws of Moses are imposed on us—Sabbatarian law, law of blood for blood, blasphemy laws—there will be revivalists of common sense to show up

the mistakes of Moses. Biblical immoralities and absurdities cannot be consecrated without recoiling in resentment and ridicule.

But the time seems ripe for the formation, between these militant hosts, of a religion based on what all believe—on what no sane man doubts. The Ethical Society marks an era. A hundred years ago five American colonies sent a few delegates to Annapolis to consult whether there might not be established in the confederated colonies some kind of uniformity in trade laws and other urgent matters. They came to the conclusion that nothing could be done so long as the States were isolated by jealousy and without political solidarity; so they issued a summons to the States, and our Union was formed, each State reserving its self-government, but each contributing to form a central power representing interests they had in common. Puritan colony, Quaker colony, Episcopal Virginia, Catholic Maryland, Baptist Rhode Island, and the rest, formed a Union, neutral as to their creeds, but strong to protect and advance them all, and guarantee the freedom of all in each. A hundred years from now the historian of religion may have to trace moral results proportionately grand to the recent convention of delegates from four or five societies for ethical culture. Among those delegates were several varieties of theoretical belief. But it is no theory that right is right and wrong wrong; that the evils of the time should be dealt with; that the ethics of society and of the home should be studied with more care and taught with more earnestness and wisdom.

Such co-operation does not demand that men should abandon their several creeds or churches. We all believe in justice, charity, freedom, truth; let us study the moral laws and their application to our condition. To some this may be subordinate to a doctrinal scheme, but they can lend a hand, be it only a left hand. But to Unitarianism, and to the phases of liberalism descended from it, this ethical religion supplies the only hope of any renewal of the life which once made the land bud and blossom under the breath of great spiritual leaders. The wine of those great vintages has gone into old bottles. All the better. The ethical union is not for any denomination, but for mankind. In the ethical union advantage may be derived from the varieties of experience and training represented in the different sects. They have all progressed farther than is supposed. In London Cardinal Manning once invited my co-operation to secure purer and cheaper water for the poor of the city. Dr. Adler tells me that he is receiving letters of encouragement for his Society for Ethical Culture from orthodox clergymen. All these have the same practical problems to deal with as the unorthodox—social, domestic, moral. The same ethical chaos surrounds us all—good instincts vulgarized by fanaticism, impurities fostered by false methods of dealing with

them, popular sentiment utilized by demagogues for base ends, crime flourishing through unscientific codes, the reformer doing that which seems right in his own eyes, without trying to see eye to eye with his brother. What heart can see any dove hovering over this chaos without an emotion of hope that its brooding may bring peace and order?

What can a liberal society do? Let it found in its community a society for ethical culture. Let it invite all, especially all public teachers, to come and consider purely moral and social subjects, theoretical and practical, social and domestic, local and national. Let the prevailing moral ideas be thoroughly searched. Let the practical methods be revised. Discipline in the home, the school, the prison; corporal punishment; the purpose of punishment, and its methods; the difference between vice and crime; how to deal with intemperance, licentiousness, pauperism; what instruction should be given boys and girls concerning sex, and the dangers, bodily and moral, amid which they move; marriage laws; poor laws; labor laws; amusements and pleasures: these and other urgent matters, about which there might be a harmony such as that which prevails among scientific men as to principles and methods, are left in crude confusion because the comparative study which elicits truth is here wanting. The clergy, to whom moral instruction of the people is entrusted, have no means of having their traditional notions checked. The preachers are not preached to. Dr. Holmes once suggested the danger that the pulpit might relapse into Paganism for lack of moral instruction. Most of the clergy are cultivating American fields with the ploughs of ancient Palestine. If a better plough were shown them there is really nothing to prevent their adopting it, though they might label it Palestinian. There ought to be an ethical school in every community in which moral science shall be studied. Sir James Mackintosh said that "morality admits no discoveries;" he declared, and Buckle followed him, that there has been no important variation in the moral rules of life for three thousand years. That stationariness has been due to the domination of dogma over the social, domestic, and political life of mankind. It is not true, however, that no progress in moral ideas, even with these disparagements. The virtue of self-truthfulness, impossible so long as the self was believed satanic, has appeared. Compassionateness for animals, unknown to the Bible, has been arising under the Darwinian era. Toleration, on moral grounds, is a new virtue, though feeble as yet and not able to keep the atheist from being boycotted. These latest moral buds and fruits prove that while theories grow gray the tree of life is renewed. Ecclesiastic cherubim no longer guard it from our approach. Its leaves are for the healing of the nation. Its fruit shall be righteousness, joy, and peace. But the time

of its ripe fruit is not yet. Morality is still largely monastic, puritanical, sour. The virtue of youth is bruised because the young man is taught by his mother and his pastor lessons of life which he presently finds do not correspond with the facts. We have free thought; we now want mature thought. Theology has run its career and now rests in the tomb of the unknowable. Nothing is heard there but the tolling of the bell and chant for the soul of the departed. However we may long to know the unknowable, to pierce the veil of the future beyond this life, we must turn from such longings and make the most of what is left us—the power to be ourselves a providence and to answer prayers. If you cannot get what you have set your hearts on, you must set your hearts on what you can get.

COMMENTS ON MR. HEGELER'S ESSAY.*

BY W. M. SALTER.

I consider that Mr. Hegeler has given us an important philosophical theory of ethics. His view seems to go with Spencer's up to a certain point. That is good which tends to the continuance of life, in ourselves and in others, and not only that, but to a greater quantum (quantity) of life, Mr. Hegeler laying special stress upon the soul-life as distinguished from the merely physical-life.

Spencer says that all our judgments of good and bad imply that life is desirable. Mr. Hegeler does not dispute this. But Spencer says, desirable, because life affords a surplus of pleasure over pain. Mr. Hegeler says, irrespective of this; according to him, life is desirable for itself alone. Spencer holds that if there were not more pleasure than pain, or if there were only equal amounts or more pain than pleasure, life would not be desirable; and then good and bad would have opposite meanings to those they now have; good would mean those actions that tend to shorten life and bad those actions that tend to prolong it. Mr. Hegeler holds that even if there is no surplus of pleasure or, I should suppose, if there is an actual surplus of pain, life is still to be desired, for it is a good in itself.

What, then, according to Mr. Hegeler, are the functions of pleasure and pain? They are not ends in themselves, but rather signs that ends are being accomplished; pleasure accompanies the maintenance and growth of life, pain its disintegration and decay. By our desire for pleasure and our dislike for pain we are influenced in the direction of those actions that tend to build up life and hindered from doing those that lead to destroy it. But pleasures are not rationally to be sought for their own sake, but because they are con-

joined with those actions that promote life. Spencer, on the other hand, cannot speak of the functions of pleasure and pain, because they are ends in themselves, the one to be sought, the other to be avoided; but he can speak of the functions of life, namely to give us a surplus of pleasure over pain. We naturally crave pleasure and avoid pain; according to such a view as Mr. Hegeler's, these desires are the machinery by which life is built up; only by using the machinery do we accomplish anything; but the structure to be reared is different from the machinery to be used. According to Spencer, the "machinery" becomes the end. To take another illustration; a locomotive is fed with coal and gives forth steam; only on this condition does it run; but its end is to run. Suppose now that it became a conscious being and felt pleasure in consuming the coal and emitting the steam, and thereupon came to the conclusion that the pleasure was the purpose for which it existed, it would be like the man who because he finds pleasure in the things that build up his life thinks that pleasure is the end and not life itself. Suppose that the things that gave pleasure tended to destroy life, as does in some rare instances, perhaps, happen; suppose the ordinance of nature were different from what it is; then, according to the logic of Spencer's view, we should seek pleasure though life were destroyed, on the ground that cessation of life is better than a surplus of pain; while according to Mr. Hegeler's view we should endure pain and renounce pleasure, because this would be the only means by which we could live, and life is the paramount end. Possibly I am in this overstating Mr. Hegeler's personal convictions, but I am only seeking to bring out the implications of his theory. If Mr. Hegeler would not hold that life is desirable in case it is attended with more pain than pleasure (even with much more), then the distinctness of his theory vanishes, and instead of *life alone* he admits pleasure also as an end; and then his theory, to have any philosophical value, would have to tell us *how much* pleasure must be in life to make it supportable or desirable? He has expressly said, not necessarily a surplus of pleasure over pain; must it then be an equal amount? or, if not so, then half or quarter as much? It seems to me, we are driven to rough calculations of this sort, if on the one hand we do not hold with Spencer that pleasure is the paramount end, and yet, on the other, allow that it is something of an end and admit that life absolutely without pleasure and full of pain would not be desirable.

Which is the right theory? I shall not attempt to answer. I have wanted to bring out clearly Mr. Hegeler's theory in my own mind, rather than to criticize it. I think, however, as between the two, that Mr. Hegeler's theory comes nearer the facts of life. The life-instinct is wonderfully deep in the race. There is nothing that we shudder at so as destruction. There

* At a meeting of the Society for Ethical Culture of Chicago succeeding that at which was read "The Basis of Ethics" by Mr. E. C. Hegeler, printed in the first issue of this Journal. In the next number will be given still further comments and criticisms made that evening.

may even be those who would rather live on in entire unhappiness than be blotted out altogether. They would rather live in misery than cease to be. And though there be few in number, there are many who would rather live, if but a little happiness is granted them once in a while, and all the rest of their existence is unhappy. The little oases in the midst of which they may linger now and then, redeem the dreariness of the desert through which they pass; they would rather go on, if an oasis is somewhere ahead, than give up the march because the desert is so wide. I suspect there are many people who do not have as much happiness as unhappiness in life; occasionally we hear of one willing to die, yes, even to take his or her life; the number of suicides is actually increasing. But I suspect that the mass of those to whom life is a long struggle, with many disappointments and little pleasure, would yet rather go on, and look on death with dread, altogether apart, too, from fears of what may come after. For myself, I would say that in searching for the truth I would rather be baffled a thousand times and have the discomfort and sense of frustration accompanying such experiences, if the thousand and first time I found the truth, than to forego the search at the outset, because I knew there would be more pain than pleasure attending it. Others might not think the result worth the trouble; I should. I should rather have the mortification and shame of defeat in the wrestle with an evil habit a hundred times over and at last win the victory, though I never thought of it again or my life ended immediately thereafter, than not undertake the struggle because there was to be more mortification than joy attending it. The amounts of pleasure and pain in a life or in the life of a race seem to me a poor means of estimating its value; but the amount of life, the amount of attainment, physical attainment, intellectual attainment, moral attainment, this, whether applied to an individual or the whole race, seems to me a high way of estimating the worth of their existence.

But here I am trespassing on the field of criticism which I had not meant to enter. The question, however, is, not which do I happen to regard as supreme, life or happiness, or which do any of us, but which is it rational to regard as supreme? It may be that because Mr. Hegeler's theory comes nearer to the facts of life it is thereby no truer as a theory; for though men do regard life as worth having, though it brings to them more pain than pleasure, it may still be asked are they reasonable in so doing, and, on those conditions, would not a perfectly rational mind rather not live at all? So Spencer thinks, and Spencer's view may be truer as an ethical theory though Mr. Hegeler's comes nearer to the facts of life. As to whether Spencer's theory is the truer of the two I shall not undertake to say, though I incline to think not.

THREE LIVE THOUGHTS.

Whosoever is afraid of submitting any question, civil or religious, to the test of free discussion, is more in love with his own opinion than with truth.—*Watson.*

Be perfect! Countless harmonies slumber in thee, to wake at thy bidding—invoke them, call them into life by means of thy nobility! Canst thou suffer the base, the perishable in thy nature to put to silence the noble and the immortal?—*Schiller.*

The repressed and unhappy are in ten-fold more danger from temptation than those who feel they are having their share of life's good. The stream that cannot flow in the sunshine seeks a subterranean channel; in like manner, when circumstances or the inconsiderate will of others impose unrelenting restraint upon the exuberant spirit of youth, it usually finds some hidden outlet which cannot bear the light.—*E. T. Roe.*

CORRESPONDENCE.

A LETTER FROM BOSTON.

To the Editors: JAMAICA PLAINS, MASS., Feb. 10, 1887.

We are a little lonely here in Boston without *The Index* coming punctually every week with its inspiration of noble words, turning our thoughts to large and commanding themes of interest.

Somehow I feel as we might when there had been a wedding in the family and the bride has gone far away. We hope the change is for happiness and good to all, and are disposed to treat the bridegroom who has borne away our treasure with all courtesy and prospective affection, but, nevertheless, we do feel lonely and a change has come over the old relations. So, while we welcome THE OPEN COURT and are hopeful of all the good it is to bring us, we yet wonder if anything can be as good as the old familiar friend, and we trust that they who receive it will like a letter from the old home.

Yesterday was the day appointed for the woman suffrage hearing at the State House, and the weather smiled upon it as it has hardly smiled for two months, and the occasion was worthy of the weather. The audience was large, as usual, and, while mostly composed of the staunch men and women who have followed this movement for years, there were some new faces and a sprinkling of remonstrants. The committee were thoroughly courteous and considerate. The cause of the petitioners for municipal suffrage was represented by Mr. Blackwell, Mrs. Stone, Mr. Garrison, Mrs. Shattuck and others, and Mr. Fay, a very gentlemanly lawyer from Brookline, appeared for the remonstrants.

While fortunate in their choice so far as the personal traits of their representative appeared, he was hardly a powerful advocate, for he gave away the whole general principle, by showing something very like approbation for the plan of allowing women to vote on the license question, and was only strenuous in his opposition to municipal suffrage, especially in large cities.

He took occasion to thank Col. Higginson for his article in *The Forum*, wherein he has stated all possible objections to woman suffrage with an ability which the remonstrants have never been able to command. This brought up the veteran colonel, whose trumpet gave forth no uncertain sound. Distinctly ranking himself with the petitioners, he fortified the claim for woman's suffrage with the noblest words of James Otis, and Benjamin Franklin, and Charles Sumner, and showed that the women who had spoken had adhered closely to these doctrines which were

at the foundation of our civil constitution. Those who had misunderstood his position and feared that the mists of conservatism were obscuring his light, rejoiced with exceeding joy over this full and candid utterance.

The meetings of the Hermetic Club have been noteworthy this winter. Mr. W. T. Harris has on two Tuesdays expounded the Bhagavadgita, and at the last session Mr. Emery, of Concord, took his place as chairman and conducted the discussion with great ability. It was curious to hear the old veteran, Mr. Pillsbury, bringing out his stern plea for practical work in the midst of this philosophic speculation.

A lady of Boston has received as her guest, and kindly given to many the opportunity of meeting at her house, Mr. Mohini, a Brahmin of remarkable scholarship and eloquence. Having had in early life the advantages of education in an English school, he speaks our language with great correctness and beauty, and is thoroughly versed in the Hebrew and Christian Scriptures. I am told that he is equally at home in both the French and Italian language and literature. Having passed through a period of doubt and agnosticism, as he says most young Brahmins do, he is now a devoted Brahmin, accepting revelation as authoritative, but not confining it to the sacred books of his own nation, but believing that the divine light shines through all sacred books and all religions. While we may not accept his beliefs, we cannot but admire the breadth and catholicity of this thought. He is still quite young and very pleasing in appearance and manners, and his influence is very strong upon some of his hearers. It indicates a wonderful advance in freedom of thought and in real liberality in religion, that those whom in our childhood we were taught to renounce as heathen are now welcomed among us to teach us of their wisdom as well as to learn of ours.

The "ladies' night" of the Liberal Union Club, on February 26th, will be an interesting occasion. Miss Eastman will be the speaker. She always speaks on religious themes with great earnestness, true insight and wide observation. Liberals need bonds of union, not to separate them from others, but for richer communion among themselves and for making their work broader and more effective.

With best wishes for the success of THE OPEN COURT, I am,
Very truly yours,

EDNAH DOW CHENEY.

LIMITATIONS OF THE HUMAN FEELING.

To the Editors:

FAIRFIELD, IOWA, Feb. 20, 1887.

An aged negro couple, living alone in the Skunk river valley, in Lee county, Iowa, frightened by rising water, attempted to reach higher ground in their wagon. The water was but two or three feet deep, yet, reaching a bad place in the road, the team was unable or refused to go farther and the old couple were left there in helplessness and peril, although their cries were, after awhile, answered from the shore and the calling back and forth lasted some time; so far as is known, no serious effort was made to rescue the unfortunates. They remained there prisoners all night in bitter and increasing cold, awaiting the rescuing party that never came. On the following morning cries were again heard by those living near, yet or some inexplicable reason no aid was sent. Not until late on the second day did any one go to them; then they were both found dead in the now frozen water beside their wagon, having attempted to unhitch the team.

All accounts of this heart-rending tragedy agree that the old couple were of that simple, child-like purity of life so common among the older generation of colored people and were dearly beloved by their white neighbors, and that the water was at no time so deep or the current so swift as to render it impossible or

even hazardous for strong men to reach them. Why, then, this apathy and inhuman inaction on the part of those who knew the situation? I have seen men swim torrents to rescue animals from a less painful and perilous situation! It would seem that of all suffering and danger this case should have been most powerfully appealing. Reverence for age and piety, sympathy for helplessness, added to the common feeling of humanity, should irresistibly have drawn any normal person to share their peril and suffering in an attempt to relieve them. The people who stood by and saw these venerable, virtuous and helpless ones of their own kind perish miserably were not savages nor brutalized peasants. They were average people of the middle working class.

The case is a disheartening puzzle. Shame and indignation seem more appropriate to it than philosophizing, yet doubtless it shows a limitation of the feeling of humanity which may be in some degree traced out and accounted for. A son or any relative would have rushed impetuously into danger to rescue the loved ones. Is it not almost as certain that near friends and associates on an equality would have done the same thing? We are forced to believe that had the old couple been white instead of black they would not have been left to their pitiable fate. No one with highly-developed altruistic feelings can see any human creature perish so without desperate efforts to save them.

The limitations then are the various degrees of selfishness left in human kind by an imperfect and faulty system of moral and emotional training. The sympathies of most people very much need broadening. Their love is intense enough when it comes near to themselves, but it rapidly loses force as it reaches out toward the great body of the race and is well nigh intercepted by the slight barrier of race difference. When the religious sentiment is centered more on humanity and less on self and the supernatural, such an incident as that on which these thoughts are founded will be impossible.

F. B. TAYLOR.

FREE-THOUGHT LYCEUMS.

To the Editors:

In the first issue of your new fortnightly I find an article by Thomas Davidson on the need for free-thought education. It interested me very much, the more because I have here since 1884 argued the necessity of a more liberal and comprehensive intellectual education than that given in the public schools. Will you kindly grant me the space for a few remarks on the proposition with which Mr. Davidson closes his paper.

I think he is mistaken if he believes that a free-thought college will do much good; it is not in the colleges that the mind is framed, as far as the feelings of fear and hope, of reverence and esteem, are concerned. It seems to me, at least, that the young people of about eighteen years, or of whatever age they may enter a college, should be sure already of being and remaining on the right side. The time for imbuing them with really liberal principles, even though they do not at once grasp all the consequences thereof, is when the period of maturity begins; and then the instruction they receive should cease to be merely elementary. The time usually decisive in determining the moral and religious, as well as the intellectual, character, is, on an average, that from the age of thirteen to eighteen. What free-thinkers want, therefore, in my opinion, is a good free-thought lyceum, to which pupils can go after graduating from the grammar room. A carefully-educated and half-way diligent boy or girl ought to be ready for the lyceum at the age of thirteen, and if he has then gone through a course of instruction of half a decade, he may safely be allowed to go to any college or university, no matter who manages it, or what the religious views of the faculty are.

Let nobody say that a free-thought school for children, or a free-thought kindergarten, might as well be proposed. With children under thirteen years almost everything depends upon the home in which they are brought up. Of course, it would be best not to send them to the public schools at all, considering their average character; but then, here a little care on the part of the parents may prevent bad consequences, while beyond the age of thirteen it cannot. My idea is that to the lowest class of such a lyceum pupils should not be admitted under thirteen nor over sixteen; they should be ready for the best of American universities latest at the age they become citizens. Let there be no more colleges in the United States, but better schools preparing for them, as pointed out by Dr. Paul Carus in one of *The Index* issues of July, 1886.

Very respectfully,

THOS. H. JAPPE.

ETHICAL CULTURE AND MONISM.

To the Editors:

PHILADELPHIA, Feb. 22, 1887.

I have just received the first number of your new paper, and, as I am a *lawyer*, as well as a *theologist*, I want to make a polite bow in *OPEN COURT* and respectfully ask to be admitted to your bar. It is easy to see that ethical culture is to have prominent standing in your *COURT*, and it deserves it; and, because I am in sympathy with the new movement, I desire to enter a brief "demurrer" to the policy of some of its chief apostles.

I think they are too outspoken and unguarded in so frequently publishing their negations in regard to God, prayer and the future life. They have a perfect right to proclaim their opinions, but I fail to see what these questions have, necessarily, to do with ethical culture. I do not believe in concealment and hypocrisy, but I would not unwittingly shock and drive away any person whose co-operation is to be desired. All intelligent men know that belief has very little to do with morals, and that some of the best men have been known as atheists and agnostics, and that the same is true of many theists and believers in prayer and the future life. Why cannot all liberals work together in the new departure of ethical culture without having their respective peculiar opinions continually paraded? I have reason for thinking, from personal observation, that this friendly hint deserves careful consideration.

Let not this ethical culture movement be hampered with a *creed*, written or implied. I have not had time to examine Dr. Montgomery's Monism, and shall reserve my opinion until the case is fully heard in *OPEN COURT*. I call myself a Rationalistic Theist, but I find *my* theism well expressed by Professor Haeckel, as follows:

"The more developed man of the present day is capable of, and justified in, conceiving that infinitely nobler and sublimer idea of God which alone is compatible with the monistic conception of the universe, and which recognizes God's spirit and power in all phenomena without exception. The monistic idea of God, which belongs to the future, has already been expressed by Giordano Bruno in the following words: 'A spirit exists in all things, and nobody is so small but contains a part of the divine substance within itself, by which it is animated.'"

I close this hasty note with a suggestion I have made in another connection:

"It was once said by a master of English literature and a keen observer that 'language is a device to conceal one's ideas;' and may it not be possible that, after all, truly scientific and candid men have substantially the same theory of the universe, and really mean the same thing, while they use very different words to express their meaning?"

R. B. WESTBROOK.

There has never been a great man who has not been either the victim of laws or the object of human ingratitude.—*Castelar*.

DRIFTING.

FIRST VOICE.

Drifting, along the dreary waters drifting,
Night on the waves, and ne'er a star o'erhead,
Never a gleam o'er all the waste uplifting,
Never a ray thro' all the darkness shed.
Drifting, along the dreary waters drifting.

Whither away, O, soul across the ocean?
Dark is the night and dangerous is the sea,
Sweeter were life with all its wild commotion,
Better were death than life like this can be.
Whither away, O, soul across the ocean?

SECOND VOICE.

O, heart, why wilt thou weary me with wailing?
Worn are we both and wasted with the strife,
Far from the toil and tears we twain are sailing,
Leaving behind the bitterness of life.
O, heart, why wilt thou weary me with wailing?

Be still, sad heart, and cease thy vain repining—
Be patient, for the night will soon be past,
Somewhere at a golden shore is shining,
Thither the flood will bear us at the last.
Be still, sad heart, and cease thy vain repining.

WALTER CRANE.

THE AGE.

WRITTEN AFTER READING "LOCKSLEY HALL SIXTY YEARS AFTER."

BY W. F. BARNARD.

This our age that wears upon its front the symbol of the truth,
Grandest age of all the ages in the promise of its youth,
Seeking out the great world-purpose, seeking it but to obey,
Lifting man up into manhood, thrusting ignorance away,
Bearing all of gathered knowledge that the human mind has won
From the distant primal ages to the latest cycles run,
Very light of light within it, light of truth if that be light;
Throwing gleams upon its pathway that erstwhile had slept in night,
This, this age finds its accuser in a lover of the past,
Blaming all our growing freedom, saying we have failed at last.
He who sang in early manhood songs that filled all men with strength,
Ends his singing, falls in darkness, lays his lyre down at length.
Broken spirit, broken purpose, all his nobler hope resigned;
Crying after vanished shadows in the blindness of his mind.
Oh the woe, the silent anguish, when a heart that once was free,
Free in hope and free in purpose, murmurs "Night: I cannot see."
If the blind say in the morning "Day is vanished it is night."
Is the morning's glory lessened? is there aught the less of light?
To us all the past is vanished; to us comes a newer earth:
All the present days and deeds are but the pangs and throes of birth.
Say you there is more of sorrow; say you there is more of tears;
Backward turn your thoughts and borrow nobler days or grander years.
Nobler days; of truer purpose. Noblest days are those that find
Man through freedom working upward; granting kingship to the mind.
Wickedness, aye, yes and virtue: virtue for its own true sake;
Needing not the fear of hell to keep its little life awake.
Sadness, badness, yes we own it. Was the past the better then?
Were men good for love of goodness, or from fear of God and men?
Crave you happiness; deserve it by the greatness of your lives;
He alone is truly happy who most truly lives and strives.
Is it better that a nation knows no wish but to obey?
Is the squalid, dumb agreement better than the righteous fray?
Shall we leave the larger ocean where the freer spirit strives
For the stagnant pool of custom with its scum of lying lives?
Is there woe and death; diseases feeding on earth's helpless brood?
Falter not then, ceaseless effort; that alone will bring the good.
Ask not thou if all are moving to the same ideal ends;
Blame not thou our larger freedom if the lower man descends.
Art thou moving toward the summit, dost thou hear the higher call,
Then thou shall not cease from labor though the stars and heavens fall.
They who learned the false lessons stagger now the truth is known;
They who did their tasks with trembling shirk them now the fear is gone.
Truth is truth nor will it linger e'en to save a thousand lives;
Let it come; and you who fear it, back again into your hives!

Progress from the thought that held mankind accurséd, steeped in sin,
To the higher thought that points but to the soul's own law within,
Is not universal progress; not all men will love the high;
Many who through fear mocked virtue, now will grovel till they die.
Let them die; we will not linger for the sake of those who need
Promises or threats to keep them in their little space of creed.
Freer souls must needs yearn upward, something dwelleth in the breast,
Making all the past seem sordid with a vision of the best.
Forward toward the perfect day, and forward toward the higher man;
Springs the greater from the lesser, 'twas for this our life began.
Man is holy, let him learn it, let him know the right of right;
Though it take a thousand seasons passed in struggle with the night.
Evolution: man's own effort is its very seed and strength;
By his striving it will conquer, bringing perfect day at length.
Oh the vast and mighty purpose, man and his true self apart;
Oh the thirst, the aspiration; Oh the throbbing human heart!
Visions fall upn my eyes; I see the higher man; his face
Set on the sun-path; see him moving, merging in the crowning race.
See him standing all transfigured on that far ideal height,
Gained at last to find new vistas stretching toward the infinite.
Oh the mystery of being! Oh the sacredness of man!
Oh the light of life within us! Oh the future we can scan!
Come the waves of deep emotion rolling silent through the soul—;
Man is holy; let him learn it; he shall gain the perfect goal.

BOOK NOTICES.

LETTERS MÉDITES DE MADMOISELLE DE LESPINASSE. Published with new documents and *une étude*. By Charles Fleury. E. Deuter, Galerie d'Orléans, Palais-Royal, 1887.

Time evokes quaint contrasts in the march of centuries, and the distance that "lends enchantment" gives to eighteenth century chronicles a peculiar charm. From an esthetic as well as literary point of view it was the great century of France. Then it was that the national spirit had reached its most characteristic expression; when classical ideals and foreign influence had dissolved away in the birth of a new order and an individuality sufficiently pronounced to cast its reflex throughout the civilized world, gave to the nation its independent personality. It was the eighteenth century that lifted France to her present rank as the leader in modern arts (a reputation which modern artists seem doing their best to forfeit). It was the eighteenth century that popularized, through the trenchant, fascinating pens of its literary lights, the new intellectual order destined to culminate in the bloody tragedy of its close. The encyclopedists, the Voltaires and the Rousseaus, are but types of the genius of the epoch when France was a torch-light on the hill-top of civilization.

It is among the relics of this rich past that the materials of the present volume were found. Those precious archives of unpublished history—the great Paris libraries—are exhaustless fields of such literary exploits. Old MSS. bequeathed in dying testaments; biographical sketches too faithful to bear the light of contemporaneous scrutiny; autograph letters palpitating with personal intimacies, designed only for private perusal. One after another these faded, worm-eaten, half-illegible souvenirs of a society gone by are dragged from their hiding-places as national heirlooms.

"The Kings of Egypt," says Cochin in his caustic criticism of the Count de Caylus, "were not judged till after their death; a wise provision, since no one would have dared to judge them living." Thus is offered to public perusal, for the first time, bits of personality, philosophic and political dissertations, fragments of individual history, etc., which time alone could render publishable. Legendary rehearsals of scenes in which the actors come back like ghosts to repeat the old and even new story of life's serio-comedy. The ambitious, the speculative, the hopeful, the joyous and the suffering—each tells his tale.

In this last category may be ranged Mademoiselle de Lespinasse. Born ignobly, though of noble parentage, given an education calculated to intensify a native sensitiveness, and then left fortuneless by the death of her fond, remorseful mother, just at an age requiring guidance and protection, this young lady started in society at evident odds; and yet she became, at the age of 24, one of its pivots.

In the *salon* of Madame Deffand, the scene of her first success, she became the center of a coterie, which later, when the jealousy of her protectress determined their separation, grew into a wider circle. Here came Turgot, the Count de Guibert, the Count de Crillon and the "bon" Condorcet, to whom she writes with such solicitude: "Spare your eyes and take frequent baths. They will cool your blood overheated by work." For twenty years the *salon* of Mademoiselle de Lespinasse was the resort of talent and rank. "D'Alembert drew and she held," was said of these two friends whose lives were closely associated for years; a tie severed for d'Alembert only by her death.

And yet, despite this social success—the admiration of an *élite* world by the force of that personality which made her queen in her realm—Mademoiselle de Lespinasse was an unhappy woman. One of that vast multitude victimized by blind sentiment, she wasted her best powers in a fatal alternation between passion and remorse. Her restless soul, bewildered by an imagination forever pursuing phantoms, knew no peace, and the strain proved too much for her physical organization. She fell into a state of melancholy which led rapidly to the end, hastened, probably, by her own hands.

The letters, inspired by this state of depression, are profound psychological studies. It would be impossible, without quoting extensively from them, to give the varied shades of this sad spirit. She grew touchingly candid at the close of her career, and her last letter to d'Alembert—the patient, devoted lover through every phase—lays bare the woman's soul. One feels that every disguise is here thrown aside in the agony of a supreme, final moment.

It is at six o'clock in the morning, a few days before her death, that she writes:

"I owe you everything. I am so sure of your friendship that I exert all my remaining force to sustain a life in which there is for me no longer hope or fear. For my sorrow there is neither remedy nor consolation, and yet I feel that I owe you a prolongation of these days which inspire me with horror.

"Nevertheless, I cannot count on my will. It may give way to my despair; and I take the precaution to write to ask you to burn, without reading, all the papers in the large black *porte-feuille*. I should die to look upon the writing of *mon ami* (the Count de Mora, then dead). I have also in my pocket a rose-colored *porte-feuille* containing his letters that I pray you to burn. Do not read them, but keep his portrait for my sake. * * * * Farewell, my friend; do not regret me. Think that in leaving this world I find a repose I can no longer hope for here. * * * * My death is but a proof of my love for Monsieur de Mora, while his has proven a response to my sentiment deeper than I ever thought.

"Alas! when you read this I shall be delivered of the weight that is crushing me. * * * * I wish to be buried with the ring I have on my finger. Farewell, my friend, forever!"

Poor d'Alembert. How much the revelation contained in the dying appeal of his friend must have added to the poignancy of his bereavement. The nature of his sentiment for her is nobly expressed in his effusion: "*To the shades of Mademoiselle de Lespinasse*," where he says: "Alas! I have lost with you sixteen years of my life."

He it was, the unwearied friend through all the vicissitudes of her restless career, and to him was left the execution of her last

will and testament, which begins with a request that six hours after her death her head shall be opened by a surgeon of "La Charité," or any other hospital, and that she may be buried as a pauper, "without being exposed under the doorway."

Proud and passionate to the end, the last hours of this unhappy woman are a strange mingling of strength and weakness. There is now nothing left her but to die—she must die.

On the night of May 23, 1776, friends gather about her bedside, knowing it is the end, and the loss seems to them irreparable. With a supreme effort she begs d'Alembert to forgive her and falls back unconscious.

Her last words were those of an American statesman: "Do I still live!"

JOHN B. ALDEN, New York, has recently issued the first volumes of a new edition of Guizot's "History of France" in handsome dark morocco, the edges neatly marbled. Price for the entire set, to consist of eight uniform volumes, \$6.00 per set. Other new publications by the same publisher are a small "Handy Atlas of the World," containing nearly 200 pages, with a map on every second page, the opposite page being occupied with description and statistics. Also Drummond's "Natural Law in the Spiritual World," which Bishop Doane calls "a great work." Nearly 200 pp.; cloth, 40 cts.

WE welcome to our exchange table, with much pleasure, the first number of *The Chicago Law Times*, a handsome quarterly magazine of over 100 pages, edited by a woman, Mrs. Catherine V. Waite of this city. Of the dozen leading articles which it contains three are by women: "Chief Justice Chase," by Mrs. H. M. Tracy Cutler, which is accompanied by a fine frontispiece portrait; "Women Jurors in Washington Territory," by Lelia J. Robinson, L.L.B., and "Admission of Women to the Bar," by Ellen A. Martin. If future numbers keep up to the high level of this first one, the magazine will be not only a credit to the lady who edits it, but to the legal profession at large.

ST. NICHOLAS for March is as breezy in tone as the month is expected to be in weather. Among its many delightful things in the way of pictures, stories, etc., are continuations of the Mexican story, "Juan and Juanita," an Alaskan story; an interesting bit of biography in "The Boyhood of Thomas Bailey Aldrich," now editor of the *Atlantic Monthly*, and a new "Brownie" poem and pictures, by Palmer Cox.

SURFEITED as we are with the reminiscences and letters of our traveling scribes, we welcome none the less heartily what Oliver Wendell Holmes begins to tell us, in the *Atlantic* for March, of "Our Hundred Days in Europe," confident that he will make us feel, ere its close, that that time is all too limited for our pleasure in the recital. James Breck Perkins gives a sketch of Théophile Gautier, the French critic; "Longfellow's Art" is criticised and enlarged upon by H. E. Scudder; "The Hippolytos of Euripides" is the subject of an article by W. C. Lawton, and Agnes Repplier has a bright and readable paper on "The Curiosities of Criticism." There are poems by James Russell Lowell, Louise Chandler Moulton and others, of which the best is "Blindfold," by Andrew Hedbrooke. "The Lady from Maine," a short story, is concluded in this number. The continued stories are by Crawford, and the combination novel by Mrs. Oliphant and the editor of the *Atlantic*.

THE CENTURY for March is quite an art number. Mr. W. J. Stillman, the art critic, has an article on "The Coinage of the Greeks," from the artistic point of view. The third of Mr. Brownell's notes on "French Sculptors," in this number, has four full page illustrations, examples of the work of Barrias, Delaplanche, Le Feuvre and Fremiet. The introductory paper is given of Mrs. Van Rensselaer's series on "The Cathedrals of England," which is said to be one of the most important art enterprises ever undertaken by this magazine. An article by John T. Stoddard, on "Composite Photography," which gives several examples of the combined loveliness of the "sweet girl-graduates" of Smith College, blending each class into one mysterious whole. Of one of these composites, the "Lounger," in a late *Critic* says: "It was a peculiar, a rather uncanny sensation that I experienced in gazing at these nine-and-forty sweet girl-graduates baked into a photographic pie, as it were, and served at a Barmecide feast where one might see and scent the savory dish, yet must forever fail to taste it. It struck me that a writer like Mr. Stockton might make much of the idea of a sentimental young man's quest in Northampton of the original of this portrait, and his being beset by faces singularly like, yet in no instance identical with, the one that had charmed him. I make the suggestion now, without charge to any one who cares to act on it and is competent to do so." A second paper on "Faith-Healing and its Phenomena," by Rev. Dr. J. M. Buckley, is preceded by an article by Mr. R. Kelso Carter, one of the leading disciples of the faith-cure. The Lincoln history is given considerable space, and the one complete story is by Geo. W. Cable.

OPINIONS OF THE OPEN COURT.

Capital is the first number of THE OPEN COURT.—PROF. W. D. GUNNING.

I like the appearance of THE OPEN COURT very much. It is neat and unostentatious. I prefer the smaller size of the page, and the wider space between the lines is also an improvement. Desp'te Mr. Abbott's injunction, it is the *Index* resuscitated under more propitious conditions. The old companions are all there. I thought it very considerate of you to let your former colleague to have as usual the honor of opening the Court. What serious and arduous work you have now before you. To establish *Ethic and Religion upon a scientific basis*. It is the greatest of all reformatory tasks.—DR. EDMUND MONTGOMERY.

Your new craft sails well and has good freight.—THOMAS DAVIDSON.

Your first number is here and looks finely.—M. J. SAVAGE.

I have glanced at THE OPEN COURT, like its exterior, form, paper, type, its *tout ensemble*, and also the articles under the different headings, as now only glanced at. Hope the O. C. will succeed in bringing much folly to deserved judgment and condign punishment.—WM. ZIMMERMAN, Chicago.

THE OPEN COURT is received. It is evidently going to have some of the good things which gave value to the *Index*.—CHAS. EATON, Toledo, O.

Came duly in receipt of No. 1. Am highly gratified with its appearance and contents. It is an honor to the great cause of Humanity and Reform. Shall do my best to obtain subscribers for you.—OTTO WITTEIN, Rochelle, Ill.

I was so mournful for the old *Index*, but it seems to me that a phoenix is arising from the old ashes that bids fair to wear more attractive plumage than even the dear *Index*. * * I have not yet read thoroughly Mr. Hegeler's Essay, but I am sure I like it pretty well, at least.

LITA BAUNEY SAYLES, Killingly, Conn.

I have just finished reading the sample first number of your Journal and it is not to flatter when I say it more than pleases me. It contains several articles of, it seems to me, great merit. Especially that of my namesake, Mr. Potter, "The Need for Free-thought Education," is very timely and should be repeated by every Liberal paper in the country.—A. L. POTTER, La Motte, Ill.

The first number of THE OPEN COURT is full of promise of a great and useful future.—T. P. WILSON, M. D., Ann Arbor, Mich.

The first number of THE OPEN COURT has a cordial welcome. Clean it looks, clear and bright it is.—F. A. ANGELL, Montclair, N. J.

The Open Court.

A FORTNIGHTLY JOURNAL,

DEVOTED TO THE WORK OF ESTABLISHING ETHICS AND RELIGION UPON A SCIENTIFIC BASIS.

VOL. I. No. 3.

CHICAGO, MARCH 17, 1887.

Three Dollars per Year.
Single Copies, 15 cts.

THE ART OF MAKING POVERTY.

BY M. M. TRUMBULL.

Part I.

It is a grievous fact and "a grievous fault" that much poverty exists in the United States to-day. That it ought not to exist in a land of such abundance is plain. The extent of it is beginning to cause alarm and some people think they hear the rumblings of a social earthquake near at hand. Reformers moralize about this poverty and seek to relieve it in a superficial way, but the art and privilege of making it are "vested rights," which may not be disturbed. So many people of influence are interested in the business of making poverty, that laws are enacted for their especial benefit, which all the political parties promised to maintain. To make poverty is the work of Congress, of the State Legislatures, of the Knights of Labor Parliament, of the Trades Union Councils and of the local statutes passed by all the mercantile, professional and industrial associations, from the lawyers and doctors down to the "brotherhoods" of carpet-layers, car-drivers and scavengers.

So much poverty is concealed by pride and self-respect, that the full extent of it is not easy to know. The most reliable measure of it that we are likely to get is found in the recent report of Mr. Carroll D. Wright, Commissioner of Labor. In this report, which is official and rather conservative, Mr. Wright expresses the opinion that there are one million working men out of employment in the United States, seven and a half per cent. of all the men ordinarily engaged in agriculture, trade and transportation, mechanical and mining industries and manufactures. This is probably an under estimate, but even thus, it exposes a substratum of poverty in our social system quite sufficient to account for the present unrest and discontent of labor. By this estimate we can measure the dimensions and extent of the distress and crime which now abound in that curious mixture of contrasts which we call the civilization of the nineteenth century. It gives results as truly as the merchants yardstick. It proves that the other millions who are not out of work are insufficiently paid. A million idle workmen looking for a job must lower the wages of all those who are at work, first, by force of competition, and secondly, because they

add nothing to the aggregate wealth out of which all wages must be paid. A million of workers out of work means a surplus of human muscle, an overproduction of men. A million of artisans and laborers so cheap as to be worth nothing, must cheapen all the rest.

If only one-half of them are married, we behold a half a million women and a million children hungry. In this low plane of poverty we find the recruiting stations for a great army of sports, and tramps, and thieves. Dr. Watts himself never suspected how much political truth was wrapped up in his warning to lazy boys, that

"Satan always finds some work for idle hands to do."

He only spoke to willing idlers in that song, but the moral of his verse will apply to unwilling idlers too. Taking income as the standard of life, we shall find that the magnetic power of this substratum is great enough to drag down every class in the community one degree lower in the scale of living than it ought to be, excepting the limited classes for whose benefit the poverty is made.

To divert ourselves and others from this gloomy spectacle, we beat the patriot gong; we call attention to the multiplying riches of the land; we boast of the height of our steeples and the splendor of our palaces. It is the daily task of newspapers to dazzle us with golden rhetoric, to describe for us the glory of the diamonds that sparkled at Mrs. Plutus's reception, and the profusion of the midnight feast that filled a thousand guests with terrapin and wine. We borrow the cloak of Dives to hide the sores of Lazarus, and boast that we have cured them; but the sores are still there; their poison taints the air we live in and multiplies the Lazaruses. With amiable goodness we organize charity, found asylums, endow reformatories, and having prescribed for the symptoms, we neglect the disease. We leave in active operation the social and political machinery that creates the poverty. We make the greedy doctrine of "self-preservation" the active principle of life, and for our social code we borrow the ethics of the fishes in the sea. We devour one another, and call our civilized cannibalism an act of "self-preservation." When we grow rich at the expense of others, we pity them, as the victims, not of us, but of that lately-discovered law called the survival of the fittest. A comforting philosophy teaches us that we survive, not because of cunning, strength and appetite,

but because we are the "fittest." "The world owes me a living," says the tramp, "and I'm agoing to have it." We call that a low sentiment, and easily prove that it is morally unsound, but if we follow the trail of it upward through its devious windings in and out, even to Plutus's parlor, we shall find that it is the inspiration of much that we dignify as "business." To restore the social health we must unmake the poverty. We must reverse the machinery of self-preservation and direct it to the preservation of us all.

From the ethereal regions of sentimental philanthropy we must descend to the prosy earth. We must discuss the moral qualities of such coarse thing as taxes, wages, rent, bread, fuel, clothes. These may be uninspiring themes, but in the relations they bear to politics and law, we shall find the mitigation, if not the cure, of poverty. The working man's poverty is absolute and relative. Absolute in his want of money, relative in the dearness of what he must buy. Whatever deprives him of work, whatever lowers his wages, whatever increases the cost of existence to him and his family, helps to make him poor. Taxes weaken him, though his name is not found on the assessor's books. He is not classed as a "tax-payer," even when he pays most of the taxes. Out of the proceeds of his labor a very large proportion of the taxes must be paid before we come down to the wages-fund at all. The city, county and State taxes may seem to concern him not, but he will find them in the rent he pays for his tenement, and in the price of whatever he buys at the store. That the laborer is such a "heavy tax-payer" is one of the chief causes of his penury. The layer of poverty at the base of our social system grows thicker and thicker in the direct ratio of increasing taxation.

Here we come to a serious obstacle in the way of social reform, the claim of the politicians to a monopoly of party questions, or whatever for the time being they choose to regard as "politics." The political economist, the professor of social science, and the teacher of moral philosophy, are all warned off the premises occupied by the "two great parties." The intruders obey the warning, partly because they recognize the claim, and partly because they themselves fear to be classed as politicians. The domain of social science includes every political question, and the methods of taxation are not the exclusive property of partisan conventions. Political economy is nothing more than household economy enlarged to the dimensions of the nation. Fearing to enter the domain of politics, reformers confine themselves to the task of soothing pain, instead of curing it. They strive to ease distress by acts of charity, leaving the big driving-wheel that makes the poverty to whirl round and round forever. They moralize instead of reversing the engine, because they think that only the party boss has any right to touch it,

and they are afraid to "speak to the man at the wheel." They talk to classes numbering millions, as if they were talking to two men. They advise employers to be just to the employed, and they tell the employed to reciprocate the justice. They forget that in the competition of business the selfish men dictate the policy of all. The law makes giants, and then kind-hearted moralists quote Shakespeare to them, and remind them that,

"Tis well to have a giant's strength,
But tyrannous to use it like a giant."

In their admiration for the sentiment, they do not notice that it is philosophically unsound, because in actual competition a giant cannot use his strength to its full advantage in any other way than "like a giant." In discussing social remedies and the causes that make poverty, we must consider not only the personal vices of improvidence and drink, but the public vices which lie concealed in the extent and methods of taxation, and in the methods of the "self-preservation" societies of every degree.

Our grammar admits of three degrees of comparison, and in analogy we separate society into three classes, the upper, lower and middle. Each of these, however, may be subdivided into a hundred different grades of "quality." We have many flights of social stairs rising one above another, from the abject plane of mere hopeless animal existence, to the gorgeous upper floor whose velvet carpets are trodden only by millionaires. The purpose of life is to climb from the stair we occupy now to the one above. Our method of doing it is to pull down those on the upper step to make room for ourselves, and to push down those on our own level to the tier directly below. This is called the "struggle for existence," the "battle of life." While there is much varying fortune in the conflict, and many ups and downs, yet the killed and wounded in our present social war far outnumber in four years the losses inflicted by the civil war from 1861 to 1865. The cost of the social war, in actual wealth, dwarfs the cost of the civil war to nothing. Where opportunities are unequal, the balance of advantage in this fight must be with wealth and cunning. In this elbowing and bustling, thousands of the "unfittest" are crowded lower and lower down even to the bottom step, and from there into the pit of actual want; aye, into that lower deep still where pestilence breeds, and out of whose dingy slums crime sallies forth at night.

Combination to limit production and increase prices, is an active maker of poverty. Aided by the principle of exclusion or the "freeze-out" process, its mischievous operation is very great. The consolidation of capital into "pools" is continually reducing the number of "hirers" and adding to the number of the "hired." As to the self-employer, he is rapidly becoming extinct. Time was when an energetic man, with a set of tools

and a trade, could start for himself and make his own living; he can rarely do so now, except as a cobbler and mender. He is crowded into the ranks of the "hired," to intensify the struggle for existence among them. This, too, is the impending fate of the smaller manufacturers and of nearly all the business classes of limited capital.

Combinations to limit production and increase prices are criminal by the moral law, and yet they are encouraged and assisted by the statutes of the land. The tribulations of a lump of coal in its travels from the mine to the mechanic's grate, furnish dramatic evidence of the poverty-making ability of these combinations.

Before the mine-owners will allow a pick to touch the coal, they require that seventy-five cents a ton be added to the price of it by Act of Congress. This done, they, instead of making coal plentiful by going to work and developing the mines in competition with each other, actually form a "pool" and agree to limit production in order to make it scarce. They literally make an "allotment" to each member in the syndicate of the quantity he shall mine. They then fix the price at which the coal shall be sold: By this time the lump of coal is out of the ground and ready to be sent to the market. Here the railroads are taken into the conspiracy, and they agree to assist the syndicate by discriminating tariffs against all competitors. To compensate them, a few cents more must be added to the price of coal. The lump now gets to the wholesale market where the wholesale merchants dump it into another "pool," which they have made for their own monopoly. They add another artificial price to it by various boycotting devices, and especially by forbidding mine-owners to sell directly to the retail trade. The lump of coal now passes into the "pool" of the retail dealers, who have already formed a combination to boycott the wholesale dealers if they dare to sell directly to the consumers. The retail dealers fix the final price of the lump of coal. At every step of its way, from the coal-cellar where nature stored it away in the ages long ago, to the stove in the poor man's home, an unnatural piece has been added to the lump of coal by artificial methods in violation of good morals and contrary to public policy. At every stage of its progress honest men, who would not join the syndicates, and poor men, who could not join them, have been "frozen out" and driven into other business, or else into the overcrowded ranks of the hired classes, or else into the army of idlers and the inevitable "pool" of poverty.

The above example may be multiplied by nearly the full number of articles necessary for existence. Like the lump of coal, everything we use, from the wheat in the stack to the washerwoman's paper of starch, is put to the torture at every step of its progress from the place of its production to the consumer's home. The

result of the process is the manufacture of a very troublesome grade of poverty. A few specimens, taken at random from the newspapers, will show the method and quality of the work. The "Barbed Wire Men" met at the Sherman House in Chicago, Nov. 17, 1885. It was announced that "the object of the meeting was to effect the formation of a strong pool which would completely control the production of the entire wire manufacturing interests of the country and arrange an unalterable scale of prices to which all must adhere. It was resolved that a *curtailment of the product* was the only means to *maintain high prices* and enable the manufacturers to reap corresponding profits."

On the 15th of June, 1886, at Erie, Pa., there was a meeting of "The Tarred Felt Paper Association." The dispatch announcing the meeting, says: "There were represented in person and by proxy a capital of \$22,000,000, which was pooled for one year. It is believed that it is the intention to *crowd out the small manufacturers.*"

On the 14th of April, 1886, a meeting of starch manufacturers was held at Chicago. The report of it says: "The specific object of the meeting was to form a pool to control the price of starch. For several months past this article has been cheaper than is strictly necessary for the benefit of the manufacturers, and the scheme is to form a combination strong enough to *brace up the prices.* It was not definitely decided whether to *limit the product* of each manufactory to a certain proportion of its capacity, or to adopt some other method of retrenchment."

On the 10th of February, 1886, "The Western Wooden Ware Manufacturers" met in Chicago. Here is an extract from the report of the proceedings: "The prevailing schedule of *prices and production* was ordered to remain in full force until the quarterly meeting, when a general overhauling of prices will be had, and those who are accused of underselling will be called to a strict accountability."

The following is an extract from a report of the proceedings of the "Mattress Makers": "The manufacturers of woven-wire mattresses yesterday completed the arrangements for the formation of a permanent organization to control the trade in their particular line of goods. The combination will be called the National Wire Mattress and Spring Bed Association, and will have for its object the mutual protection of its members, and will exercise full control over the *percentage of production* and the regulation of *market prices* for goods."

These are a few specimens that might be multiplied indefinitely. They are enough to show some of the evils of the social war. To limit production is to limit the sum total of possible wealth, and thereby to make poverty. To increase prices by making scarcity adds

to the cost of existence. This to the rich man is an inconvenience, to the man of moderate means a hardship, to the laborer hunger, cold, and sickness. It is well for us that some of those conspiracies fail, but it is deplorable that many of them succeed, and the aggregate result of them is a vast quantity of machine-made poverty that needs only organization and leadership to smite society as the hammer of Watt Tyler smote the tax-gatherer. We thank the Creator for abundance, and then make laws and regulations to promote scarcity. To make dearth is to make poverty, to limit production is to throw laborers out of work and into destitution.

The fiercest fighting on this unnatural battle-field is not over there on the right flank where capital and labor are contending, nor over yonder on the left where organized monopolies in battalion columns are trampling down all weaker competition, and all independent rivalry; it is right here in the center of the field where labor is wasting its powers in a senseless wrestle with labor. The so-called "conflict" between capital and labor is mere friendly emulation when compared with the bigoted conflict between labor and labor. Shaped into trades-union legislation the jealousy of working men toward each other is an active make of poverty.

THE RIGHTS OF THOSE WHO DISLIKE TOBACCO.

BY ANNA GARLIN SPENCER.

A woman, not overstrong, and tired with a year's hard work, starts for a sea-shore resort to spend the summer vacation and get rested and well. She first takes a comfortable seat in a parlor-car. At the end of the car and near her chair is partitioned off a select "smokers' apartment." The fumes from within that enclosure steal out and make her feel ill. She asks of the porter the privilege of exchanging her seat for one further removed from this smokers' apartment. Her request fortunately can be granted. She makes herself comfortable once more, with an inward protest against the favoritism which allows smokers to so nearly defraud her of the better air, for which, together with the more room, she has paid her extra fare. A seat next to her new resting-place is vacant, but she sees a bag and papers which indicate that it has an occupant to come. Soon the owner of the seat appears. He has been having a chat with friends and a smoke in the "regular," not the parlor-car "smoker." His clothing and person are saturated with old and new flavors of the weed. He removes a heavy woolen coat, and puts on a cool "duster." The coat is hung on the hook next our traveler, and the air from the ventilator which she has had opened for her benefit, wafts its condensed aroma directly to her nostrils. By and by a gentleman from the "par-

lor-car smoker" comes in, and greets cordially the gentleman from the "regular smoker," and asks him "to have a game" in the little room sacred to the smoking-clan; and all the while he is talking about matters and things in general, leaves the door of said apartment open. The woman traveler begs the porter to "shut that door." As he does so the two men look at her as if she must be a trifle peculiar. They then leave her for their game, and doubtless another smoke; to return in a half-hour, take seats on either side of her, and industriously "season" her with breath and clothing to the secondary aroma of pipe and cigar. An aching head and a rebellious stomach almost forbid brain exercise, but the sufferer cannot help starting a train of wondering something after this fashion: "Wonder why the same money buys a non-smoker, or any man, the use of two and even three seats—one in the regular smoker, one in the parlor-car smoker, and one in the ordinary or parlor-car, and buys a woman only one seat? Wonder why the railroad officials don't secure the woman that one free from tobacco smoke? Wonder if smokers know how offensive they make themselves to many people? Wonder if they would care if they did know? Wonder if there is anything in 'the weed' which makes men less gentlemanly, as they assuredly are, respecting smoking than in any other particular? Wonder if there is any place this side of heaven where one can breathe pure air?"

At this point her station of exchange for another road is reached, and our traveler goes from the hot car into a stifling little waiting-room. A card in the ladies' room says "no smoking allowed," but the gentleman's room is divided from her waiting-place only by an open archway, and almost all the occupants of it seem inclined to the favorite "nerve-soother."

After a little more car travel the steamboat is reached which is to take the Pilgrim to her destination. Even the "ancient and fish-like smell" of the wharf is refreshing, and with delight she establishes herself on the forward deck, which will be the shady and breezy end of the boat when the steamer turns out into the broad bay. A seat is selected where the back can be rested against the walls of the upper saloon, and with only a few heads in sight, and those of strangers who are naught to her, and who do not much obstruct her view, our traveler's joy begins. "The sea, the opaline, the beautiful, the strong," what a magic cure is it for the headache and the heart-weariness and the temper-annoyance. The breeze freshens, the billows dance, the swell grows heavier. Ah! this is life! What grateful thoughts well up in answer to nature's bounty of healing and of joy. Worth while is the strain and stress of laborious days if by them one earn the right to so enjoy this glorious summer world!

Just at this moment of content and happiness, the quick senses of the traveler detect the familiar and hated

tobacco smoke. There is her neighbor of the parlor-car. He is indulging in another cigar. He leans over the rail in front of his victim, and puffs and puffs his column of airy contamination right into the sea breezes which were so full of healing for body and mind but a minute before. The glory is gone. The little tobacco fiend gains a speedy victory over great nature's purity and peace.

The purser comes around, and "Is smoking allowed on this boat?" is the despairing question.

"Yes'm, on this forrard part. There's nobody smokin' at the other end."

"But the other end is sunny and has no breeze. Here is where I wish to stay, and," raising her voice a little, "tobacco smoke is very disagreeable to me and makes me ill."

"Sorry, ma'm. Perhaps you'd like to go into the saloon. Ladies mostly do."

The saloon! Hot, stuffy, and with a party of excursionists dancing as nimbly as the motion of the boat will allow, to the wheezes of a parlor organ from which an unwilling waltz is being coaxed! Saloon, indeed!

The gentleman with the cigar has heard the remonstrance and gallantly throws the end of his cigar into the sea, but looks as if a woman who "would make a fuss over a good cigar in a public place" was beneath contempt.

A little peace, and then three men sit near the rail of the lower deck and smoke. And several promenaders come and go with pipes and cigars and the traveler gives it up, she can keep her seat no longer.

She perches herself on the outermost seat of the deck, hanging to the rail in most uncomfortable fashion, still fighting for pure air.

At last the journey is ended; the hotel reached; the good supper dispatched with an already quickened appetite; and the piazza, which has been recommended as among the chief attractions of the place, is eagerly sought. It is indeed an entrance-way to one of nature's grandest temples. The fierce hot day is going out gently to meet the lovely night. A broad stretch of heaving sea mirrors the gorgeous sunset sky, and the trees near the cliff-walk show grand and gloomy in the twilight. "Perfect," sighs the traveler in blissful praise.

But here comes the crowd of people from the dining-room. And ten out of the fourteen men light cigars and seat themselves within a few feet of our new-comer. She must either endure the sickening annoyance, or go in out of the glory; into her little close room which is not on the "view" side of the house. She is too tired to walk beyond the range of her tormentors to-night; but she foresees that she will have to do that all the summer or lose her sunset beauty. Is it any wonder that her blissful mood is again destroyed when she considers that she is paying as much for the privilege of being

driven from the common piazza as these men are for using it?

Men and brethren, ought these things so to be?

Is there not a question of *right* involved in a condition which bears so hardly upon one side and gives the other so vast an advantage? Why should the smoker be given, or take, the mean privilege of driving from comfort to misery all those who dislike tobacco, even in the most public places? Can anyone explain on principles of justice, or good-breeding, the right of the smoker to render the air of cars, steamboats, public coaches, hotels and boarding-houses, and all other places where he elects to be, disagreeable and often sickening? It has been truly said that "smoking is the only vice that all people are compelled to share the effects of in their own persons." If my neighbor drinks whisky I am not obliged to take even a drop into my system. But if my neighbor smokes, I am obliged, as long as he remains my neighbor on the piazza or other place of resort, to inhale some of the poison he is consuming. There is much to say about the pecuniary waste and physical harm of tobacco-using as a personal habit. But the sole purpose of this article is to draw attention to the infringement upon the rights of those who dislike tobacco, perpetrated by tobacco-users, and sanctioned by those who cater to a tobacco-using public. This aspect of the question has passed beyond the boundaries of taste, or preference, or conventional good manners. It has entered the domain of *ethics*. The point now to be determined is in brief this: Have those who dislike tobacco any rights which tobacco-users are bound to respect?

If my neighbors in the city like the smell of decaying garbage about their houses, or think it wholesome and pleasant to keep a dirty pig in the cellar, I can complain of them to the sanitary authorities, and have the nuisance removed, in spite of their personal tastes in the matter. But if I take a sick baby into the country for pure air and wholesome surroundings, and the inmate of the room next mine chooses to poison the atmosphere of his own and my apartment through the open windows and thin partitions with a nasty pipe, or a meaner cigarette, I have probably no redress but to change my boarding-place. So debauched is the public conscience in this regard that any complaint of the omnipresent pollution is considered a foolish personal idiosyncrasy, to be disregarded as soon and as often as desired. It is considered by the majority of hotel-keepers, railroad and steamboat officials and servants, and all who purvey to the taste of travelers and boarders, that the smoker has the right, and that the complainant is seeking to enforce a peculiar hobby of his own. The good-natured smoker will throw away his cigar if you frankly say it is disagreeable to you, but he very evidently thinks he is making concession to an extraordinary weakness on your part,

and that that weakness will soon make you as disagreeable in his eyes as his cigar can be in your nostrils.

It is high time that this inversion of the principles of right was exposed to just light. It is high time that the man who uses a public place for the indulgence of a private habit which is positively injurious and disagreeable to many, who have paid as high a price for their use of that public place as he, should understand that *he is the offender against right and propriety*, and not the person who complains of his pipe or cigar. It is high time that petitions setting forth the injustice of the present favoritism shown tobacco-users were presented to all who now pander to this false sentiment and discrimination, and the rights of those who want pure air insisted upon.

We cannot hope to cleanse our streets of the filth and foul air that smokers and chewers torment the cleanly with. It may be too much to ask that the man who elects the smoking-car for the first half of his journey be forced to stay in it for the second half, rather than to make himself a nuisance to some one else. But at least, let us "strike" for the abolition of the smokers' apartment in the parlor-car, and for unconditional prohibition of smoking in and about the pleasantest places of resort in hotels, and public parks, and gardens, and all the nooks and corners where the non-smoking class most do congregate. And let this be demanded as a right; not begged as a kindness.

CHATS WITH A CHIMPANZEE.

BY MONCURE D. CONWAY.

Part I.

On a fair day I found myself in Benares, sacred city of the Hindus. I had seen, many cities built by men, but now for the first time beheld one built by gods. It is a City of Temples, and houses ministrant to temples. It has no trade save in gods. Its population is a procession of pilgrims which started out in immemorial time; every day a new population following that which departs, while outside may be seen through the night the watch-fires of those who on the morrow will fill street and temple, kneel at a thousand shrines, consult the oracular well, buy gilt gods with shell currency, receive baptism in the Ganges, partake of sacramental food, offer sacrifices, and pass onward. As I wander through the streets, stopping here and there to purchase little deities, or float slowly on the Ganges, some vista opens occasionally into my own past. Once I too knelt with that ashen fakir before Siva,—the Consuming Fire. These throngs whom priests are immersing—have I not seen them in the Rappahannock river? Have I not tasted those little eucharistic cakes blest and distributed to the "new creature," who, born again of the water and spirit, must eat only divine food, manna, wild

honey? How often to-day have I seen John the Baptist clad in camel's hair? The pyre is aflame. The widows, no more permitted to ascend in the fire-chariot with their lords, bathe in the river near by. One body the pariahs are burying—one that died of small-pox. The Small-pox is, by euphemism, a deity; it is angry if any form whereof it takes possession is burnt, and its sacred self scorched. Therefore, here is the one exception to cremation. Small-pox superstitions are not confined to India; thousands of Canadian peasants believe, it is said, that they who suffer that disease receive a certain consecration—no doubt a survival from the Hindu faith. Indeed, as I roam through Benares, few incomprehensible things meet my eye. I carry a large bunch of old keys, gathered from the spiritual lands through which my own pilgrimage has led me, one or another of which, with some filing, will fit the most complex of these ancestral locks. But these keys, long kept in my mental museum, unlock similar doors to dissimilar scenes in East and West. Behind the Western altar and sacrament are substantial secularities; the old charms are turned to uses not evolved from them, just as my purse-full of cowries (shells) turn into brass idols, unrelated to the mollusks that shaped them. In London or New York my creed or sacrament shall bring me various profit and promise of the life that now is. But here at Benares the creed and sacrament are not cast shells turned to currency; they are alive; the whole of human life is turned into an inorganic formation on which dwell and move forms fossilized in the West, or represented if at all in some fanatical *lusus nature*.

One morning I thought I had made a discovery. I set out before me the gods and goddesses purchased at their bazaar on the previous day, and meditated on them. I thought of the masses I had seen almost treading one on the other to get near the images here copied,—the Destroyer, the elephant-headed god, and other monstrosities; above all the hideous Kali, skull-girt, blood-lapping, in one hand a sword in the other a cut-off head. Then a little monkey-god caught my eye, and the secret of the whole thing flashed on me. What I was witnessing at Benares stood revealed as a survival of superstitions not merely pre-historic but pre-human! It was the ancient anthropoid beliefs which man had here inherited, and embodied in symbols and shrines.

Thereupon it occurred to me that I had not yet visited one of the most famous temples in Benares, or even in India—the Monkey Temple. Straightway I summoned my interpreter, a Mohammedan, and journeyed to that Temple. Near the outer door the pavement was wet with blood of the morning sacrifice; I had to pick my way to the entrance. A priest met me and threw around my neck a wreath of yellow flowers,—nasturtium-like,—which rendered me sacred enough to enter. At an inner door a pretty boy appeared

holding a salver piled with honey-cakes and sweetmeats, of the kind desired by monkeys. I bought a liberal allowance and was conducted within. My interpreter, remembering from a previous ramble my interest in Sacred Trees, guided me to a huge and very ancient one in the farther court, around which holy men were engaged in austerities. In the hollow of that tree lay a monkey and her new-born babe. I saw the mother's soft eyes looking out, without fear. Before my vision rose a scene of some simian cult, out of which that of cruel Kali could hardly be developed. This was better than butchering kids before a fury. I felt a thrill of happy emotion that beyond the blood-stained pavement I had found this consecration of the maternal principle even in the humblest beginnings of our race. But my new theory was slightly shaken.

From this point we passed into the main court. The temple mainly consists of roofless courts within courts: into the roofed parts I did not enter. Here was a wondrous, a charming scene! Hundreds of monkeys were engaged in their slumberous sun-worship on the roofs, their furzy forms decorating, as if with animated moss, the maroon-gray walls, some of the younger ones playing like children in a corner of the court. Some two score were seated along the quaintly-carven cornices, and when they saw me enter, my hands full of sweetmeats, slowly descended. There was no rushing, no scramble: indeed they appeared rather desirous of according a polite welcome to the visitor than of receiving anything from him. They descended lazily and gracefully—here a foot on some saintly symbol, there a hand on some holy image, swinging gently to the paved floor. They approached without any fear or pert curiosity; they did not hold out begging hands, nor propose to take up a collection. No one prayed to another, nor to the Brahman, nor to me. When I offered cakes and sweetmeats some accepted, and munched languidly. Their plump bodies were plainly made of plenitude of sweetmeats, but they ate a little, as if not wishing to hurt my feelings. There were several varieties of them; there were dark faces and light faces, and some that bore witness to the legality of miscegenation. There was evidently no color line in this happy community. After a few minutes the young ones returned to their play. I observed that they danced around in a ring, as the Hindus never do. Indeed, the Hindus never dance at all for amusement; their only dancers are the temple-dancers (Nautch girls) who merely describe a passion or poem with pantomimic gesticulation. An old Anglo-Indian said that a Hindu gentleman would rather commit any crime than dance, and it cannot be far from the truth. The younger monkeys danced; the middle-aged poked a little mild fun at each other; the old ones climbed again to their cornices, and to slumber in the soft sunshine.

Gradually all of them left me save one. This one had attracted my attention at first because he seemed to be a Chimpanzee, a species not to be expected in that region. He may not have been one zoologically, but I shall call him one because he was such cerebrally—I may even say spiritually. I had given him at first the finest cake I had; he had tasted it and smacked his lips, giving me to understand that it was delicious; but I saw that he did not care for it at all, and when a young monkey came—his spoilt daughter perhaps—and snatched it out of his hand he only made a show of pursuing her. While she sat quite near, eating it, this sage old monkey seemed satisfied. When she had gone after the rest he remained and looked at me steadily; also with a certain humor in his countenance, which inspired both confidence and interest. There was something in his expression which reminded me of the negro's remark when an organ-grinder brought his ape through the plantation: he had no doubt the little brother could talk easily enough if he wasn't afraid of a hoe being put in his hand. I felt a desire to be with this quaint acquaintance when Brahman and Moslem eyes were not on us. I dismissed my interpreter and the priest, sat down on a stone bench, and offered the Chimpanzee my remaining sweetmeats. He regarded this as a friendly overture, and came a little closer. He climbed on a little parapet of the wall, where, half reclining, he was still as any other god in his shrine. Then occurred the first of a series of interviews which I consider interesting enough to pass from the Temple Court of Benares to THE OPEN COURT of Chicago.

THE EVOLUTION OF CHARACTER AND ITS RELATION TO THE COMMONWEAL.

BY MISS M. S. GILLILAND.

The attainment of the greatest possible amount of social happiness I take to be the noblest of human aims; the highest within the range of our faculties; and, being within that range, worthy of belief, hope and endeavor—the highest endeavor of rational beings.

The importance of this subject needs no demonstration to students of ethics. There is, however, a large class in whom the feeling which long ago found utterance in the "how long, oh Lord, how long;" the revolt against the misery of the world with the wild wish to help it, often occurs as the result of some jar (alas, how common!) to the social sympathies, but in whom the wish dies down, drowned in an ocean of hopelessness as to the bettering of social relations, or chilled to death by the mist of a supposed pious submission to "the order of things." To those who feel but do not see, I should like to give what little help I can.

There is another class, those who do not think about it at all, whose individual aims absorb their entire

attention. To them I should like to point out the simple fact that the conditions most essential to the happiness of their fellows are precisely the conditions most essential to the attainment of their own; so that by promoting the former they inevitably promote the chances of the latter. A short-sighted egoism continually defeats itself.

First then to those who would fain better things but know not how.

We bear the burden of many sorrows and suffer, on all sides, the pain of baffled desires. Is there no help for us?

Must we console ourselves with the pious by saying: "Here we have no abiding city;" "we are but strangers and pilgrims bound for another shore." "Yonder" lies our home. "Here we are on our trial, 'tis a state of probation; we will bear it as such and try to be virtuous, knowing that our lot beyond depends upon our action here." Or, if this belief be taken from us, must we lose all hope? Must we regard humanity as a forlorn stream of sentient beings, doomed forever by a deluding instinct to propagate their species, born forever into hope, and pass forever through Disillusion to Despair, surrounded on all sides by iron law, flinging themselves against Fate like impotent waves that dash against the rocks and chafe only themselves? Our outlook is fortunately not restricted to these two views, neither of which give us much hope for our life here and now.

There is a third view which would teach us that "all evil results from non-adaptation of constitution and conditions," and that this evil is ever tending to disappear by the gradual adaptation of constitution everywhere going on. The special non-adaptation with which we have here to do is that of the human race to a social state. Long continuance of savage life and the survival of the fittest for such a life produced a character in many respects opposed to that necessary for comfortable social relations. Egoism was enormously developed; Right meant simply Might; Sympathy was prevented from developing, partly by the warlike habits of the savage and partly by the individual independence which gave rise to but few occasions of common suffering or common rejoicing. Necessity formed habit and habit formed character. But conditions were gradually changing. Increase of population necessitated the agglomeration of tribes, a division of labor and an immense increase in the amount of labor, needful to supply so largely increased a community. The wants and needs became vastly multiplied too, in accordance with a universal law, that "every change produced a diversity of effects." But change of character must ever lag behind change of conditions; because the former is the product of the latter. Hence it is that this heterogeneous, complex social life has evolved needs and wants on every side, which, as yet,

humanity is incapable of responding to. The constitution is not adapted to the conditions, hence the evil. Have we careless servants; have we slothful men of business; have we lying, thieving officials; have we aching heads from overstudy or aching backs from overwork; each and all, and a host of other ills with them are to be attributed to the same general cause—the imperfect adaptation of mankind and the needs of social life.

This view casts a flood of light on our condition, gives us a ground of hope for the gradual amelioration of our lot and enables us to give a reason for the hope that is in us. But it does more. In showing us the good it incidentally reveals to us the means of attainment. Complete adaptation of character to the needs of social life is the goal; necessity, as we have seen, compels habit or crushes the rebel; and habit forms character. Here we have at once a guide for our individual lives and for our endeavor for the lives of others. Do we want to become a clever pianist, we practice playing the piano; do we want to teach a child to sew, we make it practice sewing. "Practice makes perfect" is the pronouncement of general experience on the subject; and we shall find it as true of virtues and tastes as of any mechanical dexterity.

Let us then in our own lives endeavor to form desirable habits; and in so far as we may be able to influence the lives of others, let us try to demonstrate to them the all-importance of this magician habit, and let us try to remove stumbling blocks from his path. This last much-needed aid may be rendered by us in various ways.

First—By the avoidance of an indiscriminate charity. Let us try to help those most who are most able to help themselves, those upon whom the pressure of outward circumstances has been calamitous, rather than those out-distanced in the race of life by reason of personal incapacity, whether physical, mental or moral. It is a most salutary law that punishment should fall upon defect, and we are wrong and retard that so desirable adaptation of character and capacity to the needs of social life when we help to make punishment inappreciable.

Secondly—By our advocacy of independence in every individual member of the community. Let us not forget the rule. *Necessity* forms habit and habit, alone, forms character. How short-sighted, then, is the policy that would take from those least developed and least fitted for social duties the pressure of that necessity which is above all things best fitted to develop their capacity and fit them for efficient membership of the body social. Would we see industry flourish and idleness become irksome? Let us encourage no law which would secure to any class a life of luxurious idleness. Would we see thrift grow and waste disappear? Let us not lighten responsibility nor lift burdens natural to

any given relation. The paternal government which would save a people not from their sins but from their sin's consequences, which would interfere between an act and its natural results—whether it be by lifting from the shoulders of prostrate female virtue the burden of the support of illegitimate offspring, or from parental shoulders in general the burden of children's education, or in any other way whatsoever—that government does its people grievous wrong. It keeps them children, not indeed with the innocence and teachableness of childhood, but with its ignorance, incapacity of self-help and inadequate sense of responsibility.

These things I say chiefly with regard to laws and enactments, and our intelligent attitude toward them. Help may be given personally where the results of incapacity press with extreme severity; but let it be *personal* help, let it at least develop sympathy in the helper; and let it be judicious. Let it never be of a kind to encourage the moral offender to offend with impunity, or to place inferiority of any kind on a par with superiority.

That brings us to the consideration of the third and perhaps greatest of all the means at our disposal for helping our fellows:—the development of sympathy. Just as egoism is the chiefest preventive to happiness in the social state, so is sympathy its principal producer. All those ills at least, which we suffer from one another, ills of omission and commission, all are attributable to poverty of sympathy. Did we realize clearly the vexations caused by our misdeeds, and did the realization pain us, we would certainly act better. How then to cultivate this sympathy? It must be the business not of laws at all, but of individual effort. Let us enter into relation with others as widely as possible, let us encourage co-operation of every kind, so that we may kindle our fellow-feeling and have occasions of common sorrow and joy; and let us help personally. Even if at first we must need force ourselves to do so, eventually the desire will reward the habit. Interest in those we help flourishes marvelously quickly.

Let us try, too, to break down class prejudices, to do justice in our own estimates of those who differ most widely from us, and to promote that mutual knowledge of classes which best helps each to do justice and feel for the other. But, above all, let us try to make our interest identical by equitable relationships that shall be complimentary rather than rival—remembering that “a fellow-feeling makes one wondrous kind.”

Necessary limitations of space scarcely admit of my saying anything to that second class to whom I would address myself: those who do not care about the common weal or happiness, whose interest is purely egotistical. One would indeed almost feel inclined to leave them without a word—for they are a contemptible class—

but that they, by their action, may imperil that weal, about which if they do not care we do.

Know then, O thou narrow and miserable soul, that thy so much prized happiness is to be accomplished in no other way than by just the very means which has been recommended to thy nobler brother. Think, all ye such, if you can think, and learn! Are you cheated by your grocer? Are you pilfered from by your servants? Do you lose money over inefficient and lazy work-people? Do the shafts of your carriage break upon sudden strain because of unsound wood? Do you lose your nearest and dearest or do you yourself run the risk of being plunged into death by the breaking of bridges immorally constructed? Are you poisoned by evil odors from badly-made drains, or reduced to beggary by the dishonesty of debtors? Are you suffering from any of all the thousand ills which rascality and inefficiency daily subject us to? Know then: all these ills are traceable to the same general cause: non-adaptation of constitution to conditions, inefficiency of character to meet the needs of social life. And think: does it not concern you personally that those conditions shall be maintained which alone will mould character in the necessary direction? I pray thee think! State interference or non-interference; individual independence or meddling supervision; personal kindness or indifference and rudeness: these things seem far apart from railway accidents, typhoid fevers, trade peccadillos or work-people's stupidity; but I tell you they all belong together, they have the most intimate connection, even that relation of relations, the relation of cause and effect. Are you callous? You are so at your peril.

MONISM IN MODERN PHILOSOPHY AND THE AGNOSTIC ATTITUDE OF MIND.

BY EDMUND MONTGOMERY.

Part III.—Conclusion.

Professor Haeckel, who, as every one knows, has furnished, through his classical biological investigations, manifold direct proof in support of the evolution hypothesis, and who, through his popular works and lectures, has probably done more than any other single person to spread the knowledge of that great, life-elevating doctrine, is also the advocate of a Monism that—though essentially based on hylozoistic assumptions—pretends, nevertheless, to explain everything in strict keeping with mechanical principles. According to it, every atom is eternal and has an eternal soul. This soul possesses the properties of sensation and volition, pleasure and pain, desire and aversion, attraction and repulsion. Atoms aggregate to molecules, molecules to crystals or plastidules, plastidules to cells and cells to complex organisms. All this is said to occur in rigorous obedience to general mechanical laws, notwithstanding that it is

volition which impels atoms to form chemical combinations and that the plastidules transmit to other matter, by dint of a faculty of reproduction, the complex motion received during their evolution, the motion, in fact, in which their specific nature consists. And this faculty of reproduction, which thus renders possible organic growth and propagation, is really unconscious memory, a faculty of the soul. Parallel to the aggregation of the material particles, their souls also aggregate, forming complex souls, our own soul being the most complex of all.

The original dualism of body and mind within the atom is thus made to form, by mere grouping, what Professor Haeckel calls Mechanical Monism.

The philosophers of the seventeenth century, to whom the connection of soul and body was such a vexed question, believing—as all mechanical scientists since Descartes have believed—that each of the two modes of existence displays its own series of phenomena without the least interference from the other, these benighted philosophers would no doubt be greatly astonished at this easy solution of their central problem. You have only to lock up the two incommensurable elements together in the smallest possible compass and you will find them ready ever after to help each other out of every imaginable difficulty.

An atomistic unification of body and mind on a hylozoistic foundation was also not long ago attempted by a highly accomplished scientist, whose truly phenomenal career “the stupidity of death” cut short long before it had reached its climax. Clifford tried to prove in a quasi-mathematical way that the reality which corresponds to our mental perception of things is made of the same stuff as the mental perception itself. It would occupy too much space to expose here the fallacy of his specious argument. This the present writer has undertaken in *The Index* of December 24, 1885, pp. 307-8, where he has disproved this hypothesis of mental atomism or mind-stuff and shown that complex individual consciousness is the only kind of mental existent we know or can legitimately infer.

When it became highly probable, if not quite certain, that to each conscious state there corresponds a definite molecular motion in the brain, scientific philosophers, and among them Lewes, tried to establish a monistic view on the strength of this correspondence. This is the view usually known as the two-sided aspect, or as Psychophysical Monism. According to it, the brain-motion, the functional tremor of brain molecules, is only another aspect of the corresponding conscious state, which, in truth, is the same fact of nature, only subjectively realized, while the motion is objectively realized.

But it is quite evident that another person can realize, as percept of his own, the *brain-motion*, while the person to whom the brain belongs is experiencing the

corresponding *conscious state*. These two different facts, occurring in two different minds, cannot possibly be one and the same identical fact of nature. So, here again, we find ourselves baffled in our monistic efforts.

How, then, does science, as now constituted, really bear upon a monistic interpretation of nature?

Science proceeds on the basis of an unfaltering conviction and ever-verified supposition that the things we perceive, by means of our senses, are real existents, independent in their intrinsic nature of our perception of them. Those scientists, who believe themselves to be idealists, have merely, during their philosophical excursion, let drop into unconsciousness the leading principle of their craft. The dilemma, which our present science encounters on its way to a monistic world-conception, is unavoidable. We find in the world, as it actually presents itself to us, highly complex bodies, possessing manifold properties, some of them displaying activities and experiencing affections of a marvelous kind. In analyzing these compound structures, science reaches more and more elementary constituents, out of whose combination these compound structures are most unmistakably formed. Dissolving thus all bodies into their ultimate constituent parts, not in philosophical thought or imagination merely but in all reality, there seems, at last, nothing left but a number of elements which, in their most simple state, constitute gases, whose manifest properties—the only properties which science is allowed to reckon with—are all of the most primitive, physical kind.

Now the dilemma is, how have the marvelous hyper-physical endowments of complex bodies got into structures that are made up of nothing but physically-endowed elements?

To take the qualities known only in connection with complex structures, and place them in ever so minimized a condition into their elements, is simply begging the question and completely breaking through the limitations of the scientific method. Science, prying into the origin of things, has thus come to a beginning, consisting of a vast multitude of interacting but disunited elements, and this is certainly not Monism.

As there cannot be the slightest doubt that the universe is not made up through mere aggregation of autonomous monads or atoms; but is truly a cosmos, whose diversified and manifoldly endowed parts are all closely interdependent constituents; our attempts at interpretation have to proceed in this monistic direction, and there is no reason why we should not approach nearer and nearer the solution.

But is there anyone to be found in any time who with his understanding has yet penetrated the secret? And, if not, why should “Agnostic” be a name of reproach? The term “Agnosticism” as now used designates not a creed, but merely a mental attitude, a wise suspense of judgment

regarding certain vital questions passionately pre-judged by the society in which so-called Agnostics are living. Formerly such dissenters from authoritatively pre-cribed articles of faith were simply burned alive, and that not so very long ago. In some parts of what is called the civilized world they are still ostracized. In England an "Infidel," up to very recently, was almost universally despised, and had a very poor chance in life.

To the indefatigable exertions and eminent social qualifications of such men as Professors Huxley and Tyndall is chiefly due the great change that has taken place in public opinion among the educated of the English-speaking nations; a change which allows the mild, more pitying than condemning, if not even half or wholly-shared name of "Agnostic" to displace the harsh and spiteful epithet "Heretic" or "Infidel." Through generous sympathy with all the higher interests of humanity at large and of Englishmen in particular; through an amiable, open disposition, ever ready to give fair play to an adversary, and to enter amicably into his mode of thought; and withal armed with the irresistible and masterly-wielded weapons of science; these men—speaking the genuine human language—have gained a candid hearing for their cause from the very foremost leaders of public opinion. As prominent symptoms of the radical change that has thus lately been wrought in the direction of complete tolerance, may be named the "Metaphysical Society" of London and the "Nineteenth Century," where Roman Catholic Cardinals, Anglican Bishops and the master minds of dissenting denominations have discussed and are still discussing with free-thinkers of all shades the questions they all have most at heart.

"Agnosticism," as commonly understood, has reference principally to the two great transcendental questions, the existence of God and the immortality of the soul. Strictly speaking, all who do not base their knowledge, their gnosis, on supernatural revelation are Agnostics, whether they call themselves so or not. For, it is a fact, that the keenest and most profound thinkers among the theologians themselves have now admitted, that reason—not less than science—is incapable of bringing us positive knowledge, not only concerning the particular nature of God and the particular mode of existence in a future life, but concerning the very existence of God and a future life. The logical proofs of Anselm and Descartes, the teleological proof, the proof from causality, from free will, etc., etc.; all have turned out to be fallacious. Those then, who do not believe in supernatural revelation—and who knows how many there are of such even among professed theologians—have to ground and actually do ground their belief in God solely on the feeling of the utter dependence of existence and life upon a power, not themselves. What the intrinsic nature of this creating and sustaining power may be

remains wholly enigmatical, however much the noble stirrings of their emotional nature may prompt them to identify it with its own highest sentiment and aspiration.

Dim and confused is in truth the boundary that separates at the uttermost reach of thought earnest and open-minded seekers after truth, on whichever side of providential Faith and personal Hope their conviction or doubt may incline.

The insistence on the supreme truth of supernatural tradition ends, of course, all discussion. Our human life, however, is being more and more exclusively molded on natural revelation. This it is, that makes the spirit of our scientific era more and more humanely moral, but also more and more agnostic, as regards the constitution of the intelligible world, so minutely known and described by our forefathers. Agnosticism in reference to the supernatural world, involves by no means a generally negative attitude of mind. Quite the contrary, it leaves us all the freer to appreciate the positive marvels of nature, and to work at a progressive development of our race.

The mystery of Being and Becoming! Who in his right senses dares for a moment to assert that the least glimpse of its origin and intimate workings has been vouchsafed to him.

George Eliot—truly a representative genius of the highest aspirations of our age—with a receptiveness as open as a child's, with knowledge as wide as human understanding, with sympathy as deep as the human heart; in vain, O in vain, has her humble beseeching, her keen and tender gaze rested with life-long questioning on the silent secret "behind the veil, behind the veil."

And how many cultured persons are there, now-a-days, who would consider, for instance, St. Augustine, Luther or Calvin to be more lovable as human beings, and deem their views of human life more truly moral and estimable than those of her, who had the full courage of her free, undogmatic convictions?

PUTTING OFF THE OLD MAN ADAM.

BY W. D. GUNNING.

A few years ago Dr. Ellsberg, to account for the facts of heredity, proposed a theory which has been accepted by Haeckel. A certain number of "physiological units," plastic and therefore called "plastidules" by Ellsberg, pass, not organized into body, from parent to child, to grandchild, down along the line in diminishing ratio until at last they fade out. Let us hypothesize an Adam and Eve physiologically. The child is not a new being, but a projection of the parents. In its body, but not incorporated with it, are plastidules of Adam and Eve. The child grows to manhood and a portion of these plastidules pass, with his own, into the

body of his child. A portion, still remaining free, will pass into the next generation. A time comes when all the Adamic plastidules will be cut off. "Abbreviated Heredity" intervenes. The man has "put off the old man Adam."

This may seem fanciful, but it is no more fanciful than Darwin's theory of Pangenesis, and the facts of biology would seem to necessitate one theory or the other, or both. Nature remembers long but she forgets at last. The unfolding human body does not epitomize completely the history which lies behind it. At last the body forgets its heraldry. I weep not over the grave of Adam. His plastidules have long been cut off. Between him and me there is no bond of kinship.

Physiological plastidules may be long persistent; the spiritual persist still longer. We have worked the tiger out of our teeth and nails, but the

"Tiger, tiger burning bright
In the forests of the night,"

lingers in our passions. The mind is still toothed and clawed, but not so much as of old. With the fading out of old organic plastidules fades out their manifestations in the mind. In what mental kinship do you stand to your Adam? In the higher range of faculties you sustain no kinship at all to this protoplast.

And those, your remote ancestors in India, in Egypt, in Palestine, how much of their mind-plastidules remain in you? Fix your attention on a segment of history. I place it here on this page not to excite merriment or derision, but to point a moral. It is the history of an ark, chest, or box, holding, perhaps, a few pebbles. It was captured by the Philistines from the Israelites and taken to Ashdod. The capture and burning of all our metropolitan cities would not smite us with such consternation as the capture of this box smote into the minds of Israel. While Israel shuddered with horror, Ashdod broke out into pustules. To speak with ancient Israel, the box was doing a right godly work, throwing down the statue of Dagon and smiting its votaries with pestilence. Terrified Ashdod, not daring to burn it, took it to Gath. In Gath it wrought the same pestilence as in Ashdod, and the Gadites took it to Ekron. The box, at once, smote Ekron with pustules and mice. What *could* be done with this god-box? Palestine was aghast. No man would destroy it and no city would receive it. Ekron took it out and left it on an open field. There it kept right on creating ulcers and mice. What *could* be done? What we will call, by accommodation, "the human mind," lit on an expedient. The box, or god-in-the-box—I do not think the "human mind" differentiated them clearly—seemed to deal chiefly in ulcers and mice. "Let us," these ancient men said, "let us buy it off by giving it five gold ulcers and five gold mice, modeled after those it has sent upon us." The gold mice and ulcers were put in a little box which was

placed on the Jahweh-box, and the Philistines took the two boxes on a new cart to Bath Shemesh. This city, being Jewish, welcomed the box with rejoicing, tore up the cart for sacrifice, and killed the cows which drew it. But some of these men (it is not said that they were women) looked into the box, and "it smote the men of Bath Shemesh fifty thousand, three score and ten." It does not appear whether it killed this time with mice and ulcers.

No wonder that the survivors of Bath Shemesh sent messengers to Kirjath-jearim asking that city to take the box. Kirjath took it and appointed a priest to serve it, that is, kill birds and bullocks and rams for it. It behaved very well for three months, till King David "stirred up all Israel from Shihor of Egypt even to the entering of Hamath" to bring it to Jerusalem. They went, a whole nation as we are told, to Kirgath-jearim for this terrible box. "And they carried the ark of Jahweh in a new cart out of the house of Abinadab and Uzza and Ahiv drove the cart. And David and all Israel played before Jahweh with all their might with singing and with harps and with psalteries and with timbrels and with cymbals and with trumpets." But when they came to the threshing-floor of Chidon the oxen stumbled, the cart tipped, the box toppled, and Uzza put forth his hand to support it. "And Jahweh smote him, and he died before Jahweh." The terrible box! "And David was displeased because Jahweh had made a breach upon Uzza." The diabolical box! It was left there at the house of Obed Edom, and Israel dispersed. It was too much for a nation!

Three months passed and the nation tried again. David gathered all Israel to Jerusalem to bring the box from the house of Obed Edom. They went now with priests properly sanctified for the task. On approaching the dreaded box they sacrificed to it seven bullocks and seven rams. The historian does not tell us what it had done with its gold mice and pustules. This final expedition was successful. The box entered Jerusalem in triumph, King David in a short linen frock, a kind of "Culty sack," dancing before it "in the face of Jahweh," much to the shame of one of his wives.

What have we been reading? How does the story move you? What kinship do you feel with these people? Hardly more than you feel with the grain-gathering ants of Texas, whose psychic life has been described by Cook. They gathered into barns, so do you and so do the ants, and here the kinship ends. Their mind-plastidules have been cut off. Their mind life is no more to you than that of the pithecanthropos. But it has been the bane of theology, pagan as well as Christian, to gather up the cast-off robes of the race and make them enrobe religion. We mend an old fiddle with a piece of another old fiddle. I would build the orchestra anew, using not a shred from the timbrel of Deborah or harp of David.

I know that the past holds the root of the present. I know that we stand, body and mind, in generic relations with all the life which has gone before us. So stands the fern on relations with the liverwort. But the liverwort was such a remote ancestor that every growing fern to-day, although springing from a liverwort thallus, sluffs that thallus from the root and lives its own proper fern-life. I would have Christianity, wise like the fern, sluff from its root the low thallus of Judaism. The young dodder is rooted in the ground, but as it grows and climbs and less and less nutriment flows into it from the soil, at last it sluffs off its root and lives only from the upper world of air. I would have religion and philosophy, wise like the dodder, cut themselves loose from devitalized roots.

How many a thallus is sticking to our roots! How many shriveled, sapless, pulseless roots this climbing dodder called humanity still holds clinging to its trunk!

I have tried a cruel experiment on an infant. The child was sucking milk from a bottle through an India-rubber tube. I pinched the tube and cut off the flow. How lustily the babe continued to suck—the empty air! Babes are they whose milk bottles are in ancient Palestine and who suck through the long elastic tubes of tradition. They suck up, now a litter of gold mice and now a long-haired hunter of foxes; now a syphilitic king and now a blood-spattered seer; now a seraph snake and now, and with every gulp, the Jewish Jahweh. I would pinch the tubes. The heaven-mother has lacteal glands whose flow is perennial.

You enter a great library and your eye ranges over the thousand thousand volumes. Here, you say, is the history of all peoples, are the thoughts of all thinkers, is the record of man from troglodyte beginnings till now. To be a full man, standing tip-toe over the ages, you must read all these. Think a moment and take courage. You must not read all these, nor a thousandth part of them. A thousand to one they are sapless roots. Take down the old literature of Palestine. I am always glad to see in a family Bible the Old Testament transformed into an herbarium for autumn leaves and a hiding place for old family letters. The book is not read, an indication of good spiritual health. This family is, as a dodder, cutting off a sapless root.

Here are ponderous tomes, Rawlinson's *Ancient Empires*. You need not tarry long on these. What is Tadmor in the wilderness to you in this garden of the Lord? Tadmor, Babylon, Nineveh, they were products of an extinct order of thought. It is not necessary to your mind-growth to know their kings or their conquests.

And here are many ponderous tomes on ancient Egypt—Bunsen, Lepsius and the rest. You are tempted to tarry. Mysterious as their sphinx were these worshippers of leeks and onions and beetles and crocodiles, but that very worship cuts them off from you. Egypt, with

her Nile-brood, is a shed thallus from our fern-root. The thin volume of Renouf will give you all you need to know of Egypt.

Gibbon's *Decline and Fall of the Roman Empire*—what ponderous and learned tomes! But why should you burn the oil of midnight to learn an inventory of emperors, chiefs, battles, butcheries, as infructuous as an inventory of autumn leaves storm-cast to the ground?

Hallam's *Middle Ages*—lore interminable, and what lore! Fifteen hundred years after Plato, the toe-nail of a man who had shown himself a saint by standing ten years on a stone column in hunger and filth and rags, the toe-nail of such a man was of more value in any city of Europe than a telescope or a whole library of Greek thought! *History of the Middle Ages*—history of crows and kites! *Thoughts of the Schoolmen*—thoughts of men whose highest problem was "whether God can know more than he knows that he knows?"

Read De Coulanger's *Ancient City*, Maine's *Ancient Law*, Draper's *Intellectual Development of Europe*, Lecky's *History of European Morals*, and you will get almost all the sap from these ancient roots—all the roots save one.

Greece! In this alcove of the Greek you may linger. Here is a proliferous root which the human tree, let it spire up never so high, will never rescind. Homer, Æschylus, Sophocles and Euripides sang for all time. Plato, Pythagoras, Aristotle, Socrates, thought for the race as long as the race should be. The Greek, the people, singing and speaking in that matchless language of their's, how little did they dream that in distant ages, over all Europe and over a world unknown to them, men, as they pushed out the boundaries of knowledge and struck higher notes in the gamut of thought, would draw from their speech the drapery in which to express their inventions and robe their thoughts until the English of science and philosophy would become an Anglecised Greek!

In another alcove, side by side, it may be, with Duns Scotus, with Zurgetius de Statu Servorum, with commentaries on the curse of Canaan, with philological dissertations on the Tower of Babel, with disquisitions on the deluge, you may find a novel by a recent author; a novel whose hero was the pithecanthropoid who left his skull in the Neanderthal cave, and whose times were the far-off stone-age when man was emerging from the jungle. Read it if you can. Cry if you can over the woes of Red, the hero. A growing babe was the author, trying to suck sentiment through long tubes from the age of clubs and claws. The tube is pinched. The plastidules of Neanderthal are cut off. Red is dead, thoughly dead.

"Atrugelos," unfruitful, is the word which Homer wrote against the sea. Atrugelos write against the million parchments and tomes cast up from the restless

sea of human life. From "Thalassa," the laughing sea are the volumes of Rabelais; from "polyphoiboids," the many-voiced, are the pages of Shakespeare; from the bitter-salt sea are the volumes of Swift and later poems of Tennyson; from the storm-wracked, thunderous ocean, are the Ociamides of Æschylus and night-cries of Carlyle; from the serene deeps are the thoughts of Plato, Goethe, Emerson, Spencer.

THAT PREVIOUS QUESTION.

BY J. H. FOWLER.

The world is a mirror reflecting self: yet it is the die that stamps experience. The sun is obscured by our own atmosphere; yet it is the source of all life. Man is neither fish nor worm, but aerial and ideal. He voyages in celestial space and finds terrestrial kinship in the remotest star, yet he may explore the exclusive Ego to the north pole of metaphysics, but the lie of his assumption freezes in his teeth while his crystal logic dissolves in suffering, sympathy, love, worship, joy. Every form of experience relates him to facts objective and to beings other than self. Egoism and devotion are antipodes. One must go out of self that heat and light may come in. Exit Ego, enter Hero.

Whatever the game, Faith is a trump card and with a Heart makes a good hand. But Faith is content with error and should be confined to recreation. Trust, with plenty of dry powder is the thing for work. Skepticism, the opposite of faith, tends to eliminate error; but distrust inclines to pessimism while trust ever points to the best. Life commences in trust. Through all the long voyage paleozoic fish to modern man, Life has safely trusted the polar stars of sense. No magic of intellection can charm them out of their nature-fixed orbits or weaken our hereditary trust in them. And yet these orbs did not adorn the sky of primitive life.

There is a field of trust whereon the light of sense never beamed, a day of senseless life, yet not of blind life. If it was not light it was not wholly dark.

Objective presence dawned upon it and was recognized. There was no seeing, no hearing, no tasting, no smelling, no feeling, but there was the contact of discriminate touch: organism selecting from environment the congenial and rejecting from self the inappropriate.

The most simple and primitive vital organism is and must ever have been, from the very beginning, functionally endowed with passivity to, and adjustivity toward, environment impressible and self-adjusting. Endowed with less power and guidance, Life would have wrecked at every outset, never could have made the long rough passage to the land of specialization sense. With no power of detecting the objective fact and of self-adjustment thereto, the vital organism were, of all things conceivable, the most unfit for survival, and at any moment life were liable to be swallowed up by environment.

The phenomena of life are known only through organism. This two-fold functional endowment so essentially inheres in the vital organism that we are unable to conceive of life without it.

Life, Organism, Function, Environment, are terms so essentially correlated and interlinked by nature, that no force of logic can put them asunder. The whole process of organic evolution consists in the progressive specialization of structure better and better adapted to the performance of this fundamental duplex function. Experience is the formative factor. It moulds structure and by heredity secures permanency, subject to perpetual modification. Individuals perish, but life endures, and experience is perpetuated and cumulative, storing in perpetually modified structure. Thus the vito-mechanical impulse, and chemico-vital reaction, experienced by the earliest progenitors, becomes the habit of succeeding generations and in the more remote offspring is organically fixed as instinct. The objective impulse and subjective response repeated give to organism the infinitesimal touch of change which ultimates in the intuition of objective reality.

The simple protoplasmic organism is the constituted subject of impulse and lays direct hold upon the objective fact, not as light, heat, sound or any form of force in space or time, but simply as objective presence, congenial or uncongenial, attractive or repulsive.

From this simplest and most primitive psycho-vital function there arises within the organism a perpetual struggle with a constantly-increasing effort or tendency to enlarge and intensify the receptive capacity and to increase the power of the adaptive faculty.

Our five senses are inventions of life through experienced necessity for larger and more special capacities of impression from, and of readjustment to, the external world. They are instruments of life by which special groups of phenomena are gathered up and utilized— instruments of conquest and defense in Life's warfare with environment.

Life has come to know and conquer, and through every organism may report as truly as the great Cæsar: *Veni, vidi vici*.

The greatest American economist defined wealth as man's power to control the forces of nature. So the grade of any being in the ascending movement is determined by its conquests, what it knows, what it does.

But philosophic truth needs no rhetorical setting.

Let us renew our research. See what we can know as to the whence and what of that primitive organic experience which, as mind-stuff, Life forms into our highest psychic being.

We find it unmistakably in every organism, plant or animal. It must have been simultaneous with the dawn of Life and could not have been the result of heredity. This simple primitive passivity or impressive

susceptibility of unspecialized protoplasm bears the same relation to the senses proper that this primitive form on protoplasmic structure bears to the specialized organisms. It may, therefore, most appropriately be termed *Proto-sense*, for it is the first form of sense unspecialized, sense simply of objective presence.

At present we know no more of its origin than we do of the simple structure which bears it. When we shall have determined the origin of life we may be prepared to know the first cause of that organic susceptibility to objective impress and power of self-adjustment thereto, which antedates all experience, nay which is the source of experience.

Certainly we cannot doubt that the first and simplest vital organism performed these functions as trustingly, so to speak, as we ourselves with our highly specialized instrumentalities perform them. And shall we now for the first time call in question the rectitude of nature in this performance? Suspect her first impress upon organism and pronounce all subsequent experience illusion? Shall we not rather exalt this primitive trust into a moral element, having learned by the persistency of identity and difference, the law of fact presentation, to which we are morally bound?

Organism is a creature of nature specialized by experience. How could nature misrepresent herself to her own creature? How could nature which, tends always to the elimination of all possible error, misdirect the specialization of organ and function so as to subvert the impress of nature and alienate the creature? When our mental faculties have been created by nature and evolved through experience in contact with nature, experience which leads us to the conclusion that the fittest always survives, how can we distrust our senses, through which experience comes, and declare that what we think we know through nature is not real knowledge? That our sense percepts give us no clue to objective realities? That the world as we think we know it is by no means the world as it is? That time and space are purely mental concepts?

Convince the laborer who saws wood by the hour to fit your stove! I confess equal stubbornness—I certainly do “fail to realize that distance and position, as well as all other space relations are truly subjective phenomena.”* Notwithstanding, I am “quite certain that all our faculties are strictly determined by our organization and wholly encompassed within it,” “our knowledge is relative,”* but nevertheless true knowledge. When I know that a thing is so and not otherwise, satisfaction is not conceit. I trust my own organism and well know that I am a moral being, and, as such, related to all being. In my human fellow I recognize and reverence this transcendent worth, striving with him for the higher fulfillment.

* From an article by Dr. Edmund Montgomery printed in *The Index*.

THE DECADENCE OF CHRISTIAN MYTHOLOGY.

BY W. S. KENNEDY.

“*E pur si muove.*”—GALILEO.

Let the old gray-beard Tuscan's now somewhat hackneyed phrase serve (for want of a better) as our motto. The physical globe is in motion indeed; but how many would suspect it if left to their own wisdom? Round and round whirls the vast rock-shell, and forward forever flies, age after age ploughing its viewless furrows in the eternal void and swerving not a foot from its appointed course along the old æonian road.

“Tumbling on steadily, nothing dreading,
Sunshine, storm, cold, heat, forever withstanding, passing, carrying,
The soul's realization and determination still inheriting,
The fluid vacuum around and ahead still entering and dividing.
The divine ship sails the divine sea.”—*Whitman*.

Here, then, we are actually whirling around at the speed of a cannon-ball, and yet would never know it. A glacier is in continuous motion, yet seems to move not at all; the foundations of a great building may, little by little, be sapped by the sea, and yet how firm and majestic and apparently impregnable the noble pile will seem only an hour before the thunder of its fall! A vast pile of cumulus cloud, floating in as seeming-quiet a midsummer's sky as you please, is yet always imperceptibly drifting, drifting with the air, and slowly melting away in the fiery furnace of the solar heat. And so is it with an outworn religious system; so is it, I believe, with the atrocious evangelical theology of our day. It is like a scroll cast into the fire, the writing is legible long after the vital cohesion of the fibers has been destroyed. In recently going through the third volume of Gibbon, I was struck with his accounts of the suppression of Paganism by the Christian Emperors. The abortive, though astonishingly and splendidly energetic, attempt of the Emperor Julian to revive the glories of the old Athenian religion and philosophy (a jolly good fellow that Julian) had shown that Paganism was but a shell of rites and ceremonies, and Theodosius—390-420 A. D. had only to prohibit public sacrifices and worship to give the poetical but outworn system its quietus, or nearly so to do. In sequestered rural communities a few vintagers and husbandmen still devoutly worshipped in their little mountain temples, and brought thither their humble sacrifices for the gods in whom they believed.

But practically the closing of the temples of city and town extinguished the Pagan religion (a hint here for those who rightly advocate the taxing of church property: extinguish the public worship and you extinguish the superstition), and the abolishing of the still lingering schools and gardens of the philosophers at Athens by Justinian a century later obliterated the last remnant of Paganism. In one of his letters Shelley (profoundly, if somewhat exaggeratedly) remarks of an act of vandalism by certain convent monks, that

“associated man holds it as the very sacrament of his union to forswear all delicacy, all benevolence, all remorse, all that is true, or tender, or sublime.” If, as Carlyle said, most people are [intellectually] fools, it of course follows that the associated action of majorities must end in a certain amount of foolishness. Break up any great popular organization, I care not what it is, and you are pretty sure to disintegrate a mountainous mass of folly.

It is notoriously difficult to bring into court legally approved evidence of change of religious beliefs, since there is nothing men are so cautious in concealing. Fishermen say that lobsters in getting out of their old shells in moulting time have a hard time of it, and often leave a leg behind. So those who have passed through the throes of religious change often come forth from the trial maimed and sore, and by the measure of their sufferings know the distance that separates them from their former co-believers, and the danger there is in revealing it. Yet we are not without many extremely significant indications of the decadence of Javeh worship amongst us. Not to speak of the confessions of orthodox clergymen often made in private to Unitarians and secularists; nor of the universal abhorrence of the damnation doctrines expressed in private conversation by orthodox laymen; nor of the common lament that no young men of worth can be obtained for the Protestant priesthood (hundreds of Presbyterian churches without a head simply because there are no men to put into the pulpits, and hundreds of New England country churches closed entirely—see the *Century* some time back—for lack of interest); not to speak at large of these, nor of the general running of steam and horse cars and milk wagons on Sunday, and the opening of cigar stands, fruit stands, news stands, art museums and theatres on that day, let us confine our attention to a few concrete and special instances.

What, for instance, do you say to that piece of riotous burlesque in the student's procession at Harvard during the recent celebration of the two hundred and fiftieth anniversary. A cut of the scene lies before me. Two men in ludicrous masks are carrying an illuminated model of the college chapel, palanquin-like, on their shoulders, and the model is covered with gaily mocking and jubilant inscriptions celebrating the joy of the boys at escape from the prayer humbug. What would Cotton Mather have said to that? Or what would Jonathan Edwards have said to the recent protest of the Yale students against being fed compulsorily on worm-eaten sermons and saw-dust doctrinal puddings? What, again, is the meaning of these innumerable trials for heresy?—the trial of Prof. Swing in Chicago, the public admonition by his bishop of R. Heber Newton in Brooklyn, the recent arraignment of the Andover professors, the ejection of B. W. Williams and T. W.

Bicknell from their positions as teachers in a Dorchester, Mass., Sunday-school on account of the alleged heretical tendencies of their views, and hundreds of similar though less widely known cases. Don't you detect a good deal of trembling and shaking in the towers of Zion? And that ludicrous flight homeward of Dr. McCosh of Princeton, blinded by the too dazzling light of Harvard's secularism and agnostic science—quite significant that, eh? And the acceptance and preaching of evolution by Henry Ward Beecher, what does that mean? He seems as much idolized as ever by his people; in fact, never was more popular. And everybody seems to sympathize with that Southern divine (Withrow is it, or Woodrow?) who has been deposed by college trustees for adhering to his belief in evolution.

That fine old radical, Ruskin, remarks the complete absence from the *dramatis personæ* on the stage and in imaginative literature of the clergy of our day, and rightly thinks it a mark of their “extreme degradation and exhaustion,” as being persons who have no real share in the manly march and battle of humanity (see his *Roadside Songs of Tuscany*, p. 106). “In general,” he says, “any man's becoming a clergyman in these days implies that, at best, his sentiment has overpowered his intellect.” “In defense of this profession [of preaching], with its pride, privilege and more or less roseate repose of domestic felicity, extremely beautiful and enviable in country parishes, the clergy, as a body, have, with what energy and power was in them, repelled the advance both of science and scholarship, so far as either interfered with what they had been accustomed to teach, and connived at every abuse in public and private conduct with which they felt it would be considered uncivil and feared it might ultimately prove unsafe to interfere.” (*Fors Clavigera*, II.)

So much for the destructive portion of our subject. At some future time we may be permitted to look at its constructive side, and consider the successor of the nations' anthropomorphic gods, *i. e.*, the Universe, and ask if indeed we can as yet discover in Its manifestations any ethical trend or purpose.

Professor Huxley says:

“Tolerably early in life I discovered that one of the unpardonable sins, in the eyes of most people, is for a man to presume to go about unlabeled. The world regards such a person as the police do an unmuzzled dog, not under proper control. I could find no label that would suit me, so, in my desire to range myself and be respectable, I invented one, and as the chief thing I was sure of was that I did not know a great many things that the —ists and the —ites about me professed to be familiar with, I called myself an Agnostic. Surely no denomination could be more modest or more appropriate, and I cannot imagine why I should be every now and then haled out of my refuge and declared sometimes to be a Materialist, sometimes an Atheist, sometimes a Positivist, and sometimes, alas and alack, a cowardly or reactionary Obscurantist.”

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixon Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of THE OPEN COURT is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to THE OPEN COURT should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, MARCH 17, 1887.

RELIGION IN THE PUBLIC SCHOOLS.

The *New Princeton Review* for January contains an article from the pen of the late Dr. A. A. Hodge on "Religion in the Public Schools," in which the writer asks: "Shall the Christian majority consent that their wealth shall be taxed, and the whole energy of our immense system of public schools be turned to the work of disseminating agnosticism through the land and down the ages?" * * The alternative is simple, "Christians have all the power in their own hands. The danger arises simply from the weak and sickly sentimentalism respecting the transcendental spirituality of religion, the non-religious character of the State, and the supposed equitable rights of a small infidel minority. All we have to do is for Catholics and Protestants - disciples of a common master - to come to a common understanding with respect to a common basis of what is received as general Christianity, a practical quantity of truth

belonging equally to both sides, to be recognized in general legislation, and especially in the literature and teaching of our public schools." Dr. Patrick F. McSweeney, in the *Catholic World*, says that this article "is remarkable as perhaps the nearest approach that has yet been made by a non-Catholic to the Catholic position on the school question." But Dr. McSweeney further suggests that the *denomination* start and manage the school, "the State paying for results in the *secular* branches." If the State must regulate the secular studies, he suggests another compromise, which, "although not as suitable, might be accepted by us." He would have the State "appoint Catholic teachers for Catholic children and Protestant teachers for Protestant children, prescribing the present neutral system of education for certain hours of the school day, and giving also a fixed hour or hours for daily religious instruction."

The rights of those who do not wish to have their children indoctrinated in the Christian theology, and the rights of all who desire to reserve the religious instruction of their children for the home or the church, are equally disregarded by the Protestant and the Catholic divine. Both Protestant Christianity and Catholic Christianity, unmodified and unrestrained by the skeptical and rational thought, which they both condemn, and having the power, would be just as ready to disregard the rights of each other as they now are the rights of free-thinkers. Fortunately liberalism is so widely diffused, and the largest sects are still so tenacious of their distinctive doctrinal teachings, and so much under the influence of a rival sectarian spirit, that the work of converting our public schools into purely ecclesiastical institutions is extremely difficult. We do not believe it will succeed. The growth of liberal thought, which will make the jarring sects subordinate their differences to a common purpose, will equally broaden the scope of their common work, and make their sectarian schemes we believe impossible of realization.

THE REVIVALISTS WE HAVE, AND THE REVIVALISTS WE NEED.

When, as within the past few weeks, there has been a so-called "great revival" going on, and much stress is laid by the preachers who give the meetings their countenance (hoping by this means to fill their own empty pews), by the daily press, by the church members who attend, as well as by the revivalists themselves, to the great good accomplished by their methods in reclaiming weak, bad and brutal men from their evil ways, many persons of education and liberal tendencies are disposed to ask themselves

whether, if these representations be true, the revivalists should not be encouraged in this good work however distasteful to cultured minds such methods are.

That many of these "conversions" do result in individual reform is, no doubt, true; but equally true is it that the ultimate outcome of these revival meetings on the public mind and on general education is a deflection in the direction of ignorance.

Revivalists are wide-awake, intensely emotional, strongly earnest men, limited in their range of thought, narrow in their conceptions of man's destiny, anthropomorphic in their ideas of God. They are sincere in their beliefs — their sincerity makes them enthusiastic, their enthusiasm strikes a responsive chord of sympathy among those they appeal to by the common bonds of humanity, that "touch of nature" which "makes the whole world kin" is deftly given and the fire of a revival is started. With all honesty of purpose the revivalists bewilder thought by their constant appeals to the baser emotions and to personal experiences. "I" and "you" figure largely in those appeals which are not addressed to the intellect but to the feelings; the chords of sorrow, suffering, fear, hope, pride, reverence, are swiftly one after another touched more or less strongly, and acquiescence in the speaker's views is gained and a momentary victory is won.

But it is always from a low stand-point that these revivalists speak. They deal with worn-out ideas revamped, ignorance is patted on the head, encouraged, and in a manner canonized. Science is misrepresented, sneered at, and ridiculed. Take up the daily papers which report these revival meetings and scarcely one of the sermons, when fully reported, fails to contain some sneering reference to distinguished scientists or thinkers whose work has seemed at variance with so-called "revealed religion." Take up the published "sermons" of Sam Jones and others, and vulgar wit which would disgrace the "end men" of a minstrel show or a reputable circus clown, greets you on every page as the words of men who profess to deal with the most serious and momentous questions humanity can ask. Compare the style of the published sermons of Sam Jones, Sam Small, D. L. Moody, or even those of Joseph Cook and ask how many pages of Darwin, Huxley, Haeckel, Agassiz, Lyell, Carpenter or Gray, you would peruse if written in the same vein?

Such revivalists beget in the popular mind, doubt of science, fear of progress, reverence for ignorance. They sneer in their flippant way at all the real workers for man's development. They relate little "smart" anecdotes in which "tadpoles" and "monkeys" and parodies of the "evolution theory" are prominent, or in which so-called "arguments of

Sceptics" are overwhelmingly confuted (many of these anecdotes being on the face of them glaringly untrue), and then when a laugh is raised that suffices to stamp the falsehood as true in minds unaccustomed to careful thinking.

These are the revivalists we have. But we do need revivals of a certain sort in our midst, and consequently, revivalists.

We need revivals of commercial honesty, of public sense of honor, of private and civic virtue, of pure living, of truthfulness, of high ideals, of purposeful lives, of self denial, of all the more solid and stalwart national virtues, rather than spasmodic individual attempts at temporary halts in patent vice. We need for revivalists men and women imbued and impressed in every thought of their brains and every pulsation of their hearts with the crying need for such a revival. Men and women who would like Moody and Murphy work on year after year unmoved by hindrances or repulse, in the straight line of their duty as awakeners. We want as a revivalist not one who self-conceitedly hugs in his inner consciousness his possession of superior knowledge as only attainable by himself, but instead, one who, knowing its inestimable value to the world shall not be able to rest until he proclaims that worth and causes it to be proclaimed from every house-top and street, every hill-side and valley where a brother man resides. We want him to make, in place of flattering appeals to ignorance, trumpeted proclamation of the need of enlightenment and eloquent portrayal of the loveliness of knowledge. We want him to draw vivid word-pictures of the work, scientific effort has already achieved in relieving some of the worst ills to which nature left man a prey, and in making liberty possible and life more endurable. Such a revivalist as is best described by Mrs. Browning:

"What ye want is light — indeed —
Not sunlight * * *

- but God's light, organized
In some high soul, crowned capable to lead
The conscious people — conscious and advised —
For it we lift a people like mere clay,
It falls the same. We want thee, O unfound
And sovran teacher! — if thy heard be grey
Or black, we bid thee rise up from the ground
And speak the word God giveth thee to say,
Inspiring into all this people round
Instead of passion, thought, which pioneers
All generous passion, purifies from sin,
And strikes the hour for. Rise up, teacher, here's
A crowd to make a nation — best begin
By making each a man, till all be peers
Of earth's true patriots, and pure Martyrs in
Knowing and daring."

S. A. U.

As we rise in grandeur of life our hope will grow higher and far-reaching; we shall believe more truly in the power of the good as we see it gaining in the actual

world. Nothing shall stand before it but it shall finally be overcome. They who have this thought at heart, that the good has the right to reign in the world, and that the bad has no right to exist, feel the call upon them to work for that end; they do not ask when it shall be; they wish that it might be now. But it is not; and so they see nought before them but the *ought* demanding their effort to bring it about. The thought of a higher order of things fills them; they cannot rest satisfied with the present; it is inadequate to meet their needs.

* * *

Nothing shall stand but truth. All creeds, all bibles shall be judged according to their true worth; not miracles shall make them truer, not records of wonders done or necromancy, but the measure of their agreement with the soul's high thirst that shall set their value. That creed then, the ethic, which shall fulfill most completely our highest thoughts, which shall demand of humanity all virtue, righteousness everywhere and always, shall be our bible, our truth.

* * *

The positive basis upon which religion now rests opens the way for a higher creed and a nobler hope than the world has hitherto known. Already the religious conception of Herbert Spencer is winning adherents in all parts of the civilized world, and the spirit of free-thought has so penetrated the churches in general that but a single step is necessary to place a large number within the pale of the religion of Evolution. While this silent change is thus going on in the stronghold of Christianity, those who openly declare their allegiance to the new faith are finding in it a strength and power of regeneration which a positive religion can alone possess, and which in fundamentally affecting their own lives cannot fail of demonstrating its true value to the world.

* * *

The philosophy of Evolution defines evil as a maladjustment in relation to the conditions of physical, moral and intellectual environment—that is, to the laws of universal order. It is therefore seen that evil is a necessary condition of progress and that it is but another name for imperfection.

* * *

In the future the great mass of men will obey the rules of conduct laid down by their religious teachers, but those rules, unlike many of the rules of the past, will find their basis in a scientific conception of what is best for man. To see the benefit that will accrue from such a moral teaching we have but to compare its effects with those of the teaching that claims to come from a supernatural source. Having no sanction in the human mind, it asserts its right to command without that sanction. This once granted, it is productive of the most injurious results; the teaching may or may not be true; if it is not

it will be obeyed till the results are indisputably proven detrimental, and perhaps even long after that. If the teaching is essentially true, yet is so obscure that it can not be firmly grasped by the mind the different interpretations put upon it, the different opinions as to what it really means will develop an antagonism in practice that can not be other than disastrous to the best interests of man. With rules of right conduct sanctioned by science the future progress of the world is certain and undeniable.

* * *

It is a true view of life that the world will at sometime fulfill our hope; sometime, we know not when. But we do know our duty and feel called upon to bring about that end; our want, our aspiration to it is the proof. Standing upon this ground there is no room for doubt. In our high moments, when we see things clearly, doubt is never suggested, but the thought of a world uplifted and made beautiful in truth, seems but a picture of a truly natural condition.

* * *

Whatever feeling of sympathy may lead us to a broad interpretation of the constitution of a church we must still feel that neither conscience nor thought can find free development so long as it is constantly coming into collision with an imposed creed. The position is becoming more and more unreal within the church, for those who, having renounced the supernatural, wish to teach what they actually accept, and no longer to teach that in which they have no faith. They are incessantly led into making compromises which not only produce falsifications of the expressions of thought, but also tend to weaken their grasp upon the unalloyed truth.

* * *

The great fundamental truths that underlie all religious conceptions are indistructable—destined to live as long as man lives. But those who take Jesus for their master are but giving their allegiance to the dead, who has no word for the world of to-day. Jesus was a man of and for the time in which he lived; and the new world, so different from the one in which he taught, whose hopes and purposes are so far from the hopes and purposes held by him, cannot be satisfied with any interpretation that can be put upon his teaching. In thankfulness for the truth which he gave, it turns its face toward that larger truth of infinite development.

* * *

The recent Andover controversy finds an echo among the Congregationalist missionaries in India who are as far from agreeing on the question as to the fate of the unconverted heathen as a large and increasing number of the clergy at home are. In a late communication to the *Andover Review* the author, who is himself a missionary, throws some light upon the different shades of

opinion that prevail among his brothers in the work. While many are still thoroughly orthodox, others may be found whose convictions are as far removed from orthodoxy as the East is from the West, and who do not hesitate to put their convictions into their teachings. Still others there are who, while almost willing to admit the falsity of the old dogmas, refrain from thinking on the subject for fear of convincing themselves of the reasonableness of their doubts. Lamentable as this last is, it is but another illustration of the tenacity with which men cling to old ideas when the current of criticism threatens to bear them away.

* * *

The conception of a universal moving toward moral order or perfection leads man to desire to realize the possibilities of his nature, and in obeying the moral law he is able to do this more and more. The emotion that rises in the mind at the thought of an ideal state of humanity is one of the great guiding springs of action. As man advances morally, duty and desire become one and the same.

* * *

Prof. E. L. Youmans left behind him a number of rare manuscripts and important letters, including his correspondence with Darwin, Spencer, Mill, Huxley, Tyndall, Bain, Lubbock, Agassiz and other distinguished men with whom he enjoyed an intimate friendship. A memorial volume containing these posthumous papers and letters, to be edited by Dr. W. J. and Miss Eliza A. Youmans, brother and sister of the deceased, will make a fitting tribute to the memory of the late editor of the *Popular Science Monthly* and constitute an important and valuable addition to scientific literature.

* * *

Elizabeth Cady Stanton writes from England:

I am well, but greatly depressed with the sad news of my husband's death. When I left home he was so well and so deeply interested getting out the third edition of his "Reminiscences" that I felt sure he had many years yet of life before him. But pneumonia is always fatal in old age, and he was near eighty-two.

* * *

One of the editors of *Unity* says, "To some of us it seems clear that ethical culture cannot be much promoted by admonition and instruction alone. It is with the heart man believes unto righteousness, and the heart is cultivated through the religious emotions, through church and family life, and all its associations. To leave religion and religious association out of the account is to cut off one of the most important factors of all higher ethical culture." Much depends upon the meaning attached to words ethics and religion. Those who make ethical culture

the essential thing would include in it all which "with the heart man believes unto righteousness," all the good taught "through church and family life and all its associations" and of course the fullest consideration of *all* the factors of "ethical higher culture." There is much they say taught in the name of religion that is no part of ethics; but that all there is of truth and permanent value taught by the various religious systems comes properly within the scope and province of ethics. When liberal thinkers shall learn to use the same words with the same meanings, many of their differences will be seen to have been merely verbal.

* * *

A friend writing from Boston relates the following anecdote, told her by a head master of one of the schools in that city, as illustrative of the hold that a well-known daily paper has upon the popular mind: "The recitation was in ancient history. The pupil was expatiating upon the topic of the Olympic games. 'A great many people went to see them,' she said, 'because it was put in the paper when they were coming off.' 'The paper!' exclaimed the teacher. 'Did they have newspapers in those days?' 'Why, yes,' was the reply, 'it says so in the book, anyway; it says the *'Herald'* proclaimed them.'"

* * *

Notwithstanding the prohibition of cremation in Italy by the Holy See this method of disposing of the dead is quite popular in that country, where not fewer than sixty cremation societies exist.

* * *

The press of the country has teemed with generous tributes to Mr. Beecher, fully recognizing his genius, his eloquence, his patriotism and his far-reaching influence as a preacher and reformer. He was without doubt the greatest pulpit orator of his age. The *Christian Register* justly remarks: "Mr. Beecher's eloquence was not of the grandiloquent or orotund type. It was conversational, dramatic; it gleamed with wit and humor or dropped into pathos; it soared on the lofty wings of the imagination, and swooped down again into anecdote and illustration. His discourses were full of windows that let in the light, and some of them set in stained glass which glowed with beautiful imagery."

* * *

He who frets is never the one who mends. And when the fretter is one who is beloved, whose nearness of relation to us makes his fretting at the weather seem almost like a personal reproach to us, then the misery of it becomes indeed insupportable. Most men call fretting a minor fault—a foible, and not a vice.—*Helen Hunt Jackson.*

DARWINISM IN ETHICS.

A LECTURE GIVEN BEFORE THE CHICAGO SOCIETY FOR ETHICAL CULTURE, JANUARY 16, 1887.

BY W. M. SALTER.

It would seem the high and noble thing to do what is good and right of our own accord. We do not reach the heights of morality till goodness is the free choice of the soul. I believe that man with his wonderful gift of reason can discern a highest good, and then, unconstrained by all that is without him, can choose it. This, to my mind, constitutes the incomparable dignity of man—that he is not as a cloud driven before the winds, but, as Geo. Eliot says, “can elect his deeds and be the liege not of his birth, but of that good alone he has discerned and chosen.”

Nevertheless, we have a curious and profound interest in the question, what is the tendency of things apart from our own will? We all know that we are not masters of our own life. There are conditions outside of us to which we have to conform. To take one of the simplest illustrations, we know that if on one of these very cold winter days we were not sufficiently protected against the weather, we should perish. We must adjust ourselves to our environment—to use a phrase that has come into vogue; we are compelled to, if we wish to live. The tendency of things is thus to develop prudence; nature may be said to be on the side of those who are prudent, since those who are not she does not permit to live.

The question is, does nature sustain any such relation to morality? Does the force of things outside of us incline the race to be moral? Or is it, perchance, favorable to immorality, or is it indifferent, so that good and bad men thrive equally well? In other words, is morality a private matter about which a person need have no more serious concern than about any other question of individual inclination and taste, or is it something having, whether we will or not, issues of life and death? We naturally incline to take the former view. When we transgress any of the laws of morality, we like to say to ourselves that it is our own affair, and nothing outside of us takes cognizance of it nor will any grave result follow.

It is at this point that the views of Darwin have a wonderful interest. Darwin does not write as an ethical philosopher, but as a naturalist. In his famous chapters in the *Descent of Man* (3d, 4th and 5th of Part First), his object is not to give us a theory of ethics, but to show the part which morality has played in the development of the race. Any one who thinks that morality is a private matter and that physical strength and mental capacity are the only things that nature takes account of, should read those chapters. Everywhere, according

to Darwin, among men as truly as among the lower orders of being, there is a struggle to live; and those who are best fitted to the conditions of life succeed and leave offspring behind them, and those who are less fitted tend to extinction. Any casual variation, by which an individual has an advantage over others, is seized upon, intensified by transmission, and perhaps in time gives rise to a well-marked species.

Physically a man is no match for a bear or a buffalo; in an actual tussle he would surely be worsted. None the less is he their superior by virtue of his intelligence; he invents a spear, a bow and arrow or a gun and thereby outdoes them. So as between men and races of men; variations in the direction of greater strength of body are of slight importance compared with variations in the direction of higher mental powers; in war itself it is not necessarily the most numerous nation or the one with the hardiest soldiers, but the one with the ablest generals and in possession of the most ingenious methods of warfare that gains the victory. But Darwin shows further that the possession of moral qualities is an advantage in the struggle for existence, that a race with strong moral feelings would, other things being equal, win in a contest with another race destitute of such feelings, in other words that nature is on the side of morality as truly as on the side of the strongest arm or the largest brain. Darwinism is often interpreted in a different way. It is often thought to sanction the efforts of the stronger individual to push the weaker to the wall. Let every man stand on his own feet, and those who can't stand, let them fall—it is said. To practically apply the doctrine: if a man can get an education, well and good; if he can't, let him go without it—never should he be helped. If a woman has power to get her rights, very well; if not, let her go without them. If a person is smart enough to defraud another, let him do so; if he is strong enough to do violence to another without impunity—very well, that is his right as the stronger. This is the creed of unmeasured individualism, of anarchism, and was well expressed by Rob Roy in Wordsworth's poem, as the old rule,

“That they should take who have the power,
And they should keep who can.”

But it is very crude Darwinism, nay, it is opposed to the teachings of Darwin, for according to him our notions of what we should and should not do are derived from the social instincts, and the social instincts contradict such heartless indifference to the welfare of others as the creed of extreme individualism allows. Doubtless such social anarchy did exist in the early ages of the world, in the “ages before conscience,” but the significant fact is that the primitive races without conscience did not perpetuate themselves, that they had no strength, no stamina, no cohesive power in the struggle with those superior races in whom the social instincts were

developed, that so far as they do survive to-day, they survive as savages and are on the border line between man and the brute.

Let us observe now in detail, how morality helps to build man up, so that by his very love of life he is naturally deterred from those courses of conduct that conscience condemns. A peaceful disposition is one element of morality. I do not mean the disposition to weakly submit to injuries, but the indisposition to inflict injuries; I mean the contrary of a violent and quarrelsome temper. At first sight, it may seem as if violent people injure others rather than themselves, as if their violence gives them an advantage in the struggle to live. But turn the matter round and ask, as between peaceable men and quarrelsome men, other things being equal, which are the more likely to suffer violence in turn and themselves come to an untimely end? I think there cannot be a doubt that peaceful men are more likely to survive and rear offspring than violent men, that violence is like a boomerang striking at last the perpetrator of it, that the ways of violence, even in uncivilized societies, are the ways of death, and the ways of peace are the ways of life. Temperate habits are another element of morality. The intemperate man who indulges his appetite for intoxicating drinks thinks it his own affair and that he will not greatly suffer; but the laws of life think differently, they cut short his days; it is a statistical fact that intemperate people at the age of thirty in England are not likely to live more than thirteen or fourteen years longer, while the expectation of life of the average country laborer at that age is forty years. Another element of morality is respect for woman and the sense of the sanctity of the marriage relation. Does it make no difference if men or women lead profligate lives? So profligate people are apt to think. They are rarely serious about it. But nature is opposed to profligacy—for she will allow profligate women to have but few if any children; she has a distaste for their breed, she wants it stopped. In the natural course of things, profligate men, as Darwin remarks, rarely marry; on their side, too, the breed of ungoverned lust tends to extinction. And both men and women, who do not regard nature's laws, she is apt to afflict with the foulest disease. And if in another way, men or women sin against nature's laws and in solitude and darkness practice the crimes that the light of day would blush to look upon, does the darkness hide them and nature take no cognizance? Witness the weakness that comes on, the weakness of body and weakness of mind, the loss of memory, the childishness, yes, the sterility—'tis as if nature would cover them with contempt. And in regard to the persistent disuse of moral feeling generally, do we realize what one of our highest scientific authorities, Maudsley,* tells us, that by it a man may

succeed in manufacturing insanity in his progeny, and that insane people, if they are allowed to propagate, become at last a race of sterile idiots?

Look at the matter on a wider scale. Consider men not as individuals, but as societies. If we think that natural selection favors simply the strongest in body or mind, consider the history of the family, the most rudimentary of human societies. What would a family be without some measure of unselfishness? To answer, we have to go to the lowest savages. Among the Andamanese the husband cares for his wife until the child that is born to them is weaned. Then the mother has to look out for herself and for her child. The father seeks another mate. Is nature indifferent, and do we imagine that this is a thriving tribe? The fact is that according to a recent reporter, the Andamanese are gradually dying out. He saw but one woman who had as many as three children. Few members of the tribe live beyond the age of forty.* And now suppose the mothers had as little unselfishness as the fathers, that they let their offspring care for themselves as soon as weaned; the tribe would probably in a generation or two become extinct. It is some measure of unselfish feeling that allows our race to be perpetuated at all. Yes, Darwin shows that the social instincts to some extent exist in the lower animal, so that there is no impassible chasm in that respect between them and man; timid birds will face great danger to defend their young; if there were no unselfishness, it is doubtful if we should have anything in the world at all but the elements and insensate plants, or perhaps, the very lowest forms of animal life, whose offspring need no care; all the higher forms of animal life, as well as men, exist because unselfishness has watched over the beginnings of their existence—and what mainly distinguishes human beings from animals, along, of course, with higher intelligence, is that the social instincts in men are intenser and cover longer periods and have a wider range; human beings *are*, according to Darwin, simply that portion of the animal creation in whom variations in the direction of unselfishness and intelligence have been transmitted and perpetuated, by which they have secured a firmer foothold and a more commanding place here on the earth. Think of it, if the fishes of the sea or the wild animals of the earth or even the birds of the air had the fellow-feeling for one another that men have and the intelligence, would they allow themselves to be caught or captured or shot? Would they not be a match for man, and unless some new variations giving greater power on the one side or the other arose, would it not be a pitched battle between them and man? We are men, because along with more of mind, we do care for one another; they are animals, because they are to such an extent dissocial, rather than social, and in a con-

* *Popular Science Monthly*, September, 1870.

* *Spencer's Sociology*, I, 198.

test, each one is left so generally to fight his own battle.

And now beyond the family, consider the community or the tribe. What parental feeling is to the family, that community or tribal feeling is on the larger scale. Do we think it makes no difference whether our selfishness goes beyond our families, that all we have to do is to care for ourselves and our children, that patriotism and zeal for the public welfare are idle sentiment and that obedience to the laws is only necessary so far as it is for our own interest? Darwin and those who have written in his spirit do not think so, and history proves that they are in the right. In times of peace, as one writer* remarks, sleek and prosperous selfishness may give a certain element of strength to a society. But these are not the times that test a society. It is when dangers arise, either from without or from within, it is in times of peril, that the real strength and cohesiveness of a community are tested. Can it put down internal dissensions, that threaten its life, can it withstand a foreign foe? For, as Darwin shows, not only individuals struggle to live, but communities and nations, and natural selection works to build up and destroy peoples with the same necessity and rigor with which it operates to determine the fate of individual lives. Who does not see the truth of what Darwin points out that even in the case of animals, who live in a body and defend themselves or attack their enemies in concert, they must be in some degree faithful to one another, and if they have a leader be obedient to him—else they will likely be exterminated? How much more truly is this the case with men! Suppose the members of a tribe are given to murder, robbery, and treachery among themselves, how long will they hold together even if they have no external foe, and if they have, how easily will they be subjugated? The fact is that a tribe or community cannot live at all, unless there is more of morality than of immorality in it; and the great amount of wrong and crime that exist in some savage communities, seem so only on account of the higher standards of morality that are recognized in civilized communities and do not interfere with the fact that their practice is ahead of that of savages who scarcely live in communities at all and have few if any fixed customs or laws. Whether a people has any disinterested love of virtue or not, they must learn it; for only those who do learn it, *i. e.*, some measure of self-control, of faithfulness, of public spirit, of obedience to law, survive, and the rest, because they do not meet the conditions which nature requires, perish. Darwin says in so many words, "a tribe including many members who, from possessing in a high degree the spirit of patriotism, fidelity, obedience, courage and sympathy, were always

ready to aid one another, and to sacrifice themselves for the common good, would be victorious over most other tribes; and this would be natural selection. At all times throughout the world tribes have supplanted other tribes; and as morality is one important element in their success, the standard of morality and the number of well-endowed men will thus everywhere tend to rise and increase."

All this holds good equally of civilized peoples. The same things that lifted the social savage out of the ranks of unsocial savages or animals and gave them the pre-eminence, lift the civilized man out of the ranks of savagry altogether and give to civilized states rightful pre-eminence in the world. Crude interpreters of Darwin's theory would have us eschew all philanthropy, shut up our asylums and hospitals, abolish poor laws, and let the weak and the helpless take care of themselves or die. Prof. Sumner, of Yale College, suggests* that the advance of civilization, instead of raising the victims from the bottom, may very possibly crush them out altogether. But this would not be rising to a higher stage of civilization, but would be relapsing into barbarism, copying after the Indians, who leave their feeble comrades to perish on the plains, or the Fijians, who, when their parents get old or fall ill, bury them alive, or those animals who expel a wounded animal from the herd or gore or worry it to death. Nay, there are savages and even animals that are ahead in sentiment of these heartless Darwinians; for Darwin tells us of Indian crows that fed two or three of their blind companions, and says he himself saw a dog who never passed a cat who lay sick in a basket, without giving her a few licks with his tongue, the surest sign of kind feeling in a dog. Destroy the social instincts, dry up the founts of sympathy and pity in man, and you strike at the social bond itself; society would be dissolved into anarchy, and the long, slow, painful work of building up the race of man would have to be undertaken again from the beginning. Let any community to-day try to organize itself on the extreme individualistic plan and show no charity, each man looking after himself alone, those getting justice who are able to get it, and the rest putting up with the denial of it as best they can; let it enter into competition with other communities, who take care of their poor and their sick and give justice to every man, woman and child in their midst, though there may be some who cannot raise a finger to get justice for themselves; let the struggle come to a clash of arms, and will any one doubt what the result will be? Selfishness, Prof. Everett says, will give its money, it will not give its life for the common cause. If the social spirit has been weak in peace, it will not by a miracle become suddenly strong in war. The unsocial community will go down, as it

* Prof. C. C. Everett on "The New Ethics," in *Utarian Review*, October, 1878—a most suggestive and at times eloquent article. I am also indebted to Prof. Georg von Gizycki's valuable article on "Ethics and the Development Theory," in the *Popular Science Monthly*, July, 1882; (translated from the *Deutsche Rundschau*).

* As reported in *New York Times*, January 1 or 7, 1883.

deserves to go down, before the enthusiasm, the courage, the devotion of men that have been bred in a social community to habits of sympathy and public spirit. Yes, if the community, whose principle was "every man for himself," were by a bit of good fortune isolated and never had to enter into a struggle with other communities, I believe in time it would perish from dissensions within itself, it would disintegrate like any organism of matter whose particles are no longer held together by any common attraction and from which the animating breath of life had fled.

The thing that builds up a community, a nation, is not less, but more sympathy and public spirit—more of all the virtues that spring from these sources. Think for a moment simply of obedience, reverence for law, whether the law is made by a chief or by a people for itself. What strength, what an almost irresistible power would a whole people trained to such a habit have. The Spartans were not equal in intellectual power to other Grecian states; but for a short time they held the supremacy over all Greece. And when I think of the three hundred who defended the pass at Thermopylae against the Persians and held it at such fearful odds until their last man had fallen, and remember that according to their poet nothing but obedience to the laws of Sparta kept them at their post, I do not wonder that a country that bred such a soldiery rose once to the very head of Greece.

"Stranger, go and to the Spartans tell,
That here, obeying their commands, we fell."

stands graven on the rock as their memorial.

Socrates anticipated the thought of Darwin, and of Bagehot,* one of the most fruitful thinkers who has followed in Darwin's wake, when he said that that state in which the citizens pay most respect to the laws, is in the best condition in peace and is invincible in war;† and Socrates himself had such a sense of the sanctity of the laws that he refused to flatter and supplicate the judges at his trial (which the laws forbade), and although had he consented to do anything of the kind, he might easily have been acquitted, as Xenophon says,‡ he preferred to die abiding by the laws, rather than transgressing them to live. What could withstand, other things being equal, a nation of men like Socrates? I believe that the things that tend to make a people strong, permanently strong, that tend to give it a lasting advantage in the struggle for existence, that make it the fittest and always the fittest to survive, are good things, moral things, things that conscience from its ideal standpoint would approve. This does not apply to temporary victories, but to those that are held, that are lasting. *Respice finem*—look to the end and issue of all things. No one can doubt that those great eastern empires that

we have glimpses of in connection with Hebrew history and legend, the Egyptian, the mighty Assyrian, the Babylonian and Persian, perished in turn because they were not fit to live. No one can doubt that Greece fell a prey to Rome, when she was no longer worthy to rule herself. No one can doubt that imperial Rome itself fell when it was best she should fall, and that it was owing to natural selection that the barbarians of the north became then the leaders of the world's progress, since out of their splendid energy and purer stock the foremost nations of a new world have come. It is difficult to speak of the present and the future. But the same laws will hold good. Always, I believe, will the nations that have anything like a permanent leadership in the world's affairs be the best nations—I mean those that have the largest amount of virtue and intelligence within their borders. It may be indeed that no nations at present existing will be permanent; this would not be contrary to natural selection, but a proof of its power. It may be that none of them have the conditions of permanency. For natural selection is, I believe, as high in its demands, as severe, as unrelenting as any ideal of the Deity that has ever been conceived. Nations that are full of selfishness and injustice cannot stand; they will be turned and overturned; the great powers of nature will not allow them to last. Nations with ruling classes given up to luxury, to effeminate habits, to wantonness, to "the lust of the flesh, the lust of the eyes and the pride of life," and to contempt of the poor and the weak, will not stand; "behold, this was the iniquity of Sodom, pride, fullness of bread, and abundance of idleness; neither did she strengthen the hand of the poor and needy. And they were haughty and committed abomination before me; therefore I took them away as I saw good."§ So speaks natural selection today, and always will, for it is a power as dread, as summary and as almighty as Jehovah. Nations full of violence toward weaker countries, eager with yawning necks to swallow them up and digest them for their own purposes, will not stand; they who are insolent and know no right above the sword shall perish by the sword; the power of natural selection is a moral power, and nothing, no success or triumph conceived and begotten in injustice, shall stand. This great judge of all the earth holds up the balances and says to the nations, for every act of injustice thou shalt pay. England, France, Germany, America,—each thinks it is dear to the heart of Destiny and cannot fail; and Destiny whispers through all the experience of the past, I care for none of you, you may go, have your little day, and pass away as Babylon and Greece and Rome have done before you; I care for justice, for a state of virtuous citizens with pure homes and clean hearts and honest lips, men and women who put truth above life and would rather their state should

* Vide his *Physics and Politics*.

† Xenophon's *Memorabilia* iv, 4, 15.

‡ Ditto, iv 4, 4.

§ Ezekiel, xvi, 49-50.

fall than that it should rest on injustice; I call for this, give it to me, O sons of men, and you shall be dear to me, I shall cherish you, and your work shall stand while the earth lasts.

This is how, my friends, I interpret the ethics of Darwin. Darwin does not give us a theory of ethics, or rather so far as he does I should have something to say in criticism of it; but he does us a greater service, I almost think, than if he had given us a perfect theory, he shows *how ethics works in the world*. It is a great and consoling belief that the powers of nature are on the side of man's struggles after justice and a perfect good. The Mighty Power, hid from our gaze by the thin screen of nature and of nature's laws, is not in love with you or me, but he is with our struggles after a perfect right, for to them he gives fruition and they are the salt that keeps the earth from spoiling, and their effect is undying, while all else is being thwarted, cut short and passes away. Every brave act we do and every true word we utter helps to build up human life here on the earth; and every mean act and false word tend to pull it down and destroy it. I have spoken of peoples and nations; let us not think that these are things too large for individual actions to count upon. The fate of a nation depends at last not on kings or parliaments or legislatures, but on the lives and characters of the individual men and women who compose it. As the Statement of Principles of our Society puts it, the well-being of the state depends upon the well-doing of its individual members. We think we are not responsible for the evil and wrong there are in society. We are to the extent that we submit to them. A great wrong cannot be done by a community unless there is the spirit of wrong or of tolerance for wrong, widespread among its members. Each one of us, no matter how unimportant we seem, counts as a factor in the public sentiment from which good things or bad things are born. I came across a striking passage in a writer the other day: "There are current maxims in church and in state, in society, in trade, in law, to which we yield obedience. For this obedience everyone is responsible. For instance, in trade and in the profession of law, everyone is the servant of practices the rectitude of which his heart can only half approve—everyone complains of them, yet all are involved in them. Now when such sins reach their climax, as in the case of national bankruptcy or an unjust acquittal, there may be some who are, in a special sense, the actors in the guilt: but evidently for the bankruptcy each member of the community is responsible in that degree and so far as he has himself acquiesced in the duplicities of public dealing; every careless juror, every unrighteous judge, every false witness, has done his part in the reduction of society to that state in which the monster injustice has been perpetrated."* That

came to me as a startling thought. Yes, you do count. And the only difference is that you may count in those influences that help to build man up here on the earth or in those that tend to weaken and undo him. You may build on the sands and the floods will come and wash your work away, or on the rock and your work will stand forever. You may help to make a nation of money-getters, close, hard, contemptuous of the weak, sacrificing honor and shame, and the sense of humanity and life itself for the sake of amassing riches, only to see it, if you could live on, crumble and disintegrate and its wealth in ruins, or you may cast in your lot with those who would be lovers of their kind, who would rather see justice done than amass riches, who would be clean in life and honor woman and protect the defenceless, and if you do not win the nation to your side, you or those who follow after you will form the saving remnant, by whom and through whom a new and wiser nation may arise. Men trying to rear states without justice in their hearts are like Sisyphus rolling his giant stones up hill, that nevertheless fall of natural gravity; and when one sees them anxious, striving, thinking with laws and constitutions and courts and armies to buttress themselves about, laboring so with their destiny, one thinks of poor Sisyphus, in Homer's lines, heaving and straining, the sweat the while pouring down his limbs and the dust rising upward from his head. "Wash ye, make you clean, put away the evil of your doings from before mine eyes; seek justice, relieve the oppressed," is the voice of natural selection as well as of Israel's God; else your work is vanity and all the labor of it and all the pain of it—all are for nothing; the great God of the world will not permit it to stand.

Two applications, and I am done. Think of the Athenian race, whose average ability Francis Galton, another writer who has followed in Darwin's wake, says,* was nearly two grades higher than our own, *i. e.*, as much as our race is above that of the African negro. Why did this marvelously-gifted race decline? Galton says because of social immorality, because, in plain language, marriage became unfashionable and was avoided, and courtesans held sway. Now I say every man to-day, whether immoral or not, who has light thoughts of woman, who is not indignant when she is dishonored, who lets light jests pass his lips or lewd thoughts linger in his mind, helps to swell the tide of our social immorality, for he helps to make the atmosphere in which it grows. Acts do not come from nothing, they come from thoughts and words and what we hear others say, from a thousand and one nameless things that seem to count for nothing.

On the other hand let us not imagine that the quiet, homely virtues, the graces of the heart, that kindness and pity and tenderness count for nothing with the great

* Robertson's Sermons, 3d series, p. 147.

* Hereditary Genius, p. 343.

powers of nature with which we deal. Never let us think that physical strength is everything; it is not everything even in the animal world. As Prof. Everett has beautifully said, to the powers of natural selection, "the delicate, the graceful, the tender, the beautiful, are as dear as the fierce and the strong. It was the great law of natural selection itself that taught the nightingale to sing and that painted the humming bird with his changeful hues. It is this that whispers to the timid hare to flee, and this that binds the gentle sheep together in their harmless federation." The gentler virtues all count in humanity's struggle for existence. As there are no light thoughts of human suffering that do not help to make men cruel, so there is no sympathy and pity that do not help to draw men nearer together and make them stronger in any time of danger or distress. Quiet fortitude in a mother makes brave sons and daughters. Love in peace makes heroism in times of danger. Selfishness disintegrates and disorganizes, love builds up and welds together. Nations stand not on dollars, not on armies, not on police, but on righteousness, and if unrighteousness becomes rampant in a community, not all its dollars or its police will save it. You and I count, my friends, living quiet inconspicuous lives as we do; oh, let us count for good, for purity, for unselfishness, for all that makes human life strong and stable on the earth.

FURTHER COMMENTS ON MR. HEGELER'S ESSAY.

CHICAGO, March 12th, 1887.

B. F. UNDERWOOD, ESQ., City:

DEAR SIR—Kindly publish in No. 3 the attached communication and editorial note, clipped from the *La Salle Republican*.

I hold their wishes to be both sincere from their standpoints—the one that of an ardent Catholic.

Sincerely Yours,

EDWARD C. HEGELER.

SCIENTIFIC ETHICS.

THE OPEN COURT is a new Chicago publication, issued fortnightly, and "devoted to the work of establishing ethics and religion upon a scientific basis." The feature that makes this periodical of interest to La Salle any more than the hundreds of others of its class is that our fellow-townsmen, Mr. E. C. Hegeler, is one of the incorporators of the publishing company, a financial backer of the enterprise and a contributor to the first issue of this organ of scientific ethics and religion. The first article, by W. J. Potter, is about the only one seriously worthy of consideration as a scientific effort to explain the mystery of man's relation to man, and the something these scientific (?) men call nature. Mr. Hegeler's effort is that of a man with excellent vision walking in dark

places and seeking with outstretched hands something he cannot find. His scientific (?) attempt to explain the immortality of the soul by the theory that while individual souls become extinct at the time of the physical dissolution, the aggregate soul of our humanity lives on and evolves into higher and better forms in each succeeding generation, is very foolish and too much of a theoretical abstraction to conform to the principles of sound philosophy. Not only this, but such a theory is opposed to the convictions, practices and laws of the entire human race in every age and clime, so far as history, tradition or investigation have yet revealed them to us. When these scientific men endeavor to diffuse the individuality of every distinct human soul, with its individual responsibility for its free acts and words, its distinct, real and conscious existence after the physical dissolution, and its possibility of attaining a perfect and worthy end by its individual effort in the nebula of the confused, insane and vapory nonsense of pananimism, then they not only take a false position but they degrade humanity, maintain an attitude adverse to their own personal actions and do a great wrong to society.

The effect of such a theory upon society would be not only a great wrong, but a disaster, and reduce mankind to a mass of immoral animals wherein selfishness and rapine would rule with physical violence, and the laws of justice and humanity be as naught. It would remove the *adequate motive* which prompts men to be good, and leave in its place only a vapid idealism, negative and withering. These highfalutin theories may captivate and amuse the minds of wealthy philanthropic theorists who are too proud to follow the sure paths laid down by nobler though humbler minds, or they may entertain the innate capacities of the flatterers and sycophants who bask in the smiles of wealthy patrons, but they can never supplant the burning truths of Christianity sown in the depths of the human heart, and reaped in the harvest of justice, faith, hope and eternal love. THE OPEN COURT may be a forum for scoffing at the true good, but it can never in its present form be a hall of light and truth in which men can learn the right way to the better end.

ROXOCO.

The *Republican* has received no request from anyone to review or even notice THE OPEN COURT, but the critical comments of our correspondent, as found elsewhere, lead us to remark in connection therewith, that the only proofs thus far in life presented to us in support of the theory that man has a soul comes under the head of heresy evidence. First-class courts generally rule out that kind of testimony. It strikes some people that the tenets of

the whole list of religions are founded on neither axiomatic nor demonstrable truths, but something established by tradition, which, by the way, is not a very distant relative of what is commonly known as superstition.—*La Salle Republican*.

CORRESPONDENCE.

RESOLUTIONS BY THE F. R. A.

To the Editors:

CONCORD, MASS., March 10, 1887.

The following resolutions have been passed by the Executive Committee of the Free Religious Association, with a request that they be published in *THE OPEN COURT*.

Resolved, That in company with all friends of progress and admirers of purity and independence in journalism, we regret deeply the inevitable discontinuance of *The Index*, and that we are satisfied that this is not due to any lack of fidelity, energy or ability either in its noble and gifted founder, Dr. F. E. Abbott, or in his successors.

Resolved, That we hold the names of its recent editors, Messrs. Wm. J. Potter and B. F. Underwood, who have conducted it most ably under the auspices of the Free Religious Association, in gratitude and honor, and that we now render our warm thanks, not only to them, but to all who have aided the paper with pen or purse.

In sending the above I take the opportunity of expressing my own confidence in *THE OPEN COURT*, as was prophesied by Mr. Wm. C. Gannett at the supper of the F. R. A. in Boston, on November 18th, "the soul of *The Index* is marching on."

FRED. M. HOLLAND, Sec'y F. R. A.

SCHILLER'S GODS OF GREECE.

(Freely translated in part.)

BY B. W. BALL.

1

Still ruled ye with dominion bland,
Earth's happy generations swaying,
Fair Beings out of Fable-land,
When all the young world went a-Maying,
And still thy fanes with wreaths were bright,
O Amathusian Aphrodite!

2

Around the Truth the drapery fair
Of Poesy was woven then,
Life's fullness streamed through earth and air,
As it will never stream again—
To make her loved and lovely man
Nature enriched with will and feeling,
So that whate'er his eyes might scan
Was trace of Deity revealing.

3

Where only now, as sages say,
Soulless an orb of fire is burning,
Carborne, a stately God of Day,
In ether blue men were discerning;
An Oread haunted every hill—
With every tree a Dryad died—
And with its silvery foam each rill
Was deemed from Naiad's urn to glide.

* * * *

4

To old Deucalion's race descending
Enamored Deities still came;
For mortal maid his flocks while tending
Apollo felt a lover's flame;
Abke round heroes, gods and men
Love did his rosy bondage twine—
Mortals and gods and heroes then
All knelt at Amathusia's shrine.

5

Your festive ritual never knew
Harsh penance or austere devotion—
The happy were akin to you—
All hearts throbb'd with a glad emotion;
For then the Holy was the Fair,
To Beauty's scepter all submitting,
Man's raptures gods blushed not to share,
If Muse and Graces were permitting.

6

No specter o'er the bed of death
Hung ghastly then, but sad affection
Kissing received the parting breath,
And Love his torch lowered in dejection,—
* * * *

7

Where art thou, lovely world? Again
Return, O vanished bloom of yore!
Save in the Land of Song your reign,
O happy Golden Time, is o'er,
Dishallowed meadows, forests mourn—
No glimpse of Duty is given—
From disenchant'd earth forlorn
Her haunting life of gods was driven.

8

Out of the cold North breathing dun
A blast that fairy world invaded,
And, while exalted was the One,
The mythic host before him faded,
In yonder starry vault I find,
My lost Selene,* thee no more,
While hollow echo on the wind
Answers my call from wood and shore.

9

Unconscious of the joy she yields—
Of her own splendor unaware—
Blind to the plastic power that wields
And fashions her forever fair—
Deaf to the voices in her praise—
Like lifeless pendulum's vibration,
Lo, goddess Nature now obeys,
Slave-like, the law of gravitation.

10

Day dies, but with each fresh morn shines
Resurgent from its grave diurnal;
The moon, waxing and waning, winds
Like spindle swift its round eternal,
Useless, to Poet's Land they flew,
Their home, the gods of earth's young days—
The world no more their guidance knew,
But held itself self-poised in space.

11

Yes, homeward to the Poet's Land,
The bright gods flying bore away
All that was beautiful and grand—
Life's melodies and colors gay—
Saved from the whelming stream of time
O'er heights of Pindus still they hover,
Immortally in song sublime
They only live, whose life is over.

* Selene, Greek name of the moon.

BOOK NOTICES.

PHILOSOPHICAL REALISM. By *William Levin Gill*, author of "Evolution and Progress" and "Analytical Processes." Boston: Index Association, 1885; pp. 292.

The leading object of this little volume in paper covers, composed mainly of a series of papers printed a few years ago at considerable intervals in *The Index*, is to show that the only reality is Mind; that material things have no existence *per se*; that they are but "mortal modes of mortal thought," which pass away and perish with the power of sensibility which begot them, mind alone

THE OPEN COURT.

remaining and enduring forever. Mr. Gill's philosophical realism is *idealism*, and this our author holds is the goal toward which all thought and action clearly tend.

The work shows acquaintance with the various schools of speculative philosophy and it is marked by much acuteness of thought and ingenuity in anticipating and replying to objections. This volume, like the other works of Mr. Gill, is independent in spirit, and contains chapters to which no orthodox theologian is like to give assent. Among its defects are needless repetitions and obscurities of expression which detract from its value, but in spite of which it is an able contribution to speculative thought.

PRACTICAL PIETY. From Discourses delivered at Central Music Hall, Chicago. By *Jenkins Lloyd Jones*. Chicago: Charles H. Kerr & Co., 1887; pp. 60. Cloth, price 30 cents.

As samples of these sermons we quote the following: "When our lives are most in attune with high things, how many clamorous wants recede into the background" (from Sermon on "The Economics of Religion"). "Ideas, the high price of which tempt us to shrink from the purchase, endure, priceless gems in the cabinet of the universe, outshining and outlasting the stars themselves," ("Bread *versus* Ideas.") "Your brain is fertile with the deposits of your ancestors. Your blood is rich with the triumphs of your forerunners. Your heart is made tender with the tears of the mothers that were unappreciated in life and are forgotten in death." ("Present Sanctities.") "The claims of a child are: 1st, to be well born; 2d, to a welcome into the world; 3d, to the sympathy of its elders; 4th, to a long childhood; 5th, to a practical education; 6th, to a moral training; 7th, to religious influences, spiritual aptitude, an appetite for heavenly things, a thirst for perfection." ("The Claims of the Children.")

TREASURE TROVE for March is full of bright reading for bright girls and boys. Over a score of illustrations give point to the stories, poems, biographical sketches and instructive articles of the number. Of these three are portraits of Gen. Hunt, Florence Nightingale and James Fenimore Cooper. 151 Wabash Ave., Chicago; \$1.00 per year. Treasure Trove Publishing Co.

A VERY timely article, in view of the recent earthquakes, is the opening one in *Scribner's Monthly* for March, entitled "The Stability of the Earth," by N. S. Shaler, which is accompanied by a dozen pertinent illustrations by first-class artists. The frontispiece is a striking portrait of M. Thiers, French historian and statesman. One of the most interesting papers of this number is contributed by Hon. E. B. Washburne, ex minister to France, "Reminiscences of the Siege and Commune;" another is that entitled "What is an Instinct," by Prof. Wm. James, of Harvard College. The serial stories are by Harold Frederic, H. C. Bunner and "J. S. of Dale." There are also short stories by Joel Chandler Harris, Robert Gordon Butler and T. R. Sullivan, and poems by R. Arnytage and Andrew Lang.

THE ART AMAIEUR for March is a very lively and agreeable number. It is curious to learn that the great religious picture, "Christ Before Pilate," has been bought by the Philadelphia "big dry-goods dealer," Wanamaker, as an aid to his business, while it is reported, though the report is not confirmed, that Huyler has bought the \$100,000 Rembrandt, to show to everyone who buys fifty cents worth of molasses candy. It has been found profitable to put a big Bongereau in a bar-room, while sometimes the pictures have proved too attractive and diverted the attention of the customers from buying. Can it be that the shop and the saloon are to be the patrons of Art instead of the palace and the Church? If so, what will Art become? Will it pander to the lowest taste of its

patrons, or will it really represent the religion of the great mass of humanity—and tell of the life which is lived, often purely and heroically—amid the turmoil and strife of business? A complete collection of Millet's etchings, owned by Mr. Keppel, of New York, must afford a rare treat to all lovers of this great master. Greta tells good news of the Boston Art Museum—first, that it has secured the services of Mr. S. K. Koehler to take charge of its valuable collection of engravings. Mr. Koehler is very much interested, also, in forming a historical collection of American engravings and all contributions to it will be welcomed and properly arranged. The hope that the museum will be able to add a new wing to the building this year is also a delightful prospect. It will enable the museum to exhibit treasures already in possession and make room for more, which will surely come. The illustrations in this number are very attractive. The colored plate of Titmice, by Miss Ellen Welby, seems to ring with the freshness and gladness of spring. The little wood-cuts are remarkably good. Dupre's Twilight and Schreyer's Gipsy Encampment are full of feeling. The Patient Donkey tells the story of the weary days' wandering. The little genre from Meyer Von Bremen, "Too Hot," has all the tenderness and naivete of that charming master, while "Betsy Prig and Sairey Gamp Taking Tea" do justice to those inimitable sketches of Dickens. The ornamental designs adapted from flowers are very good. One gives the leaves and blossoms of the pitcher-plant, and would be very effective in many styles of embroidery or decorative work. The reproduction of a pen-drawing by F. Hopkinson Smith, after Ziem, gives much of the charm of light and shadow of his Venetian pictures.

WHAT THE PRESS SAYS OF THE OPEN COURT.

THE OPEN COURT, which takes the place of the *Index*, and is now published at Chicago as a fortnightly, is a great improvement on that rather unequal journal and brings to the front, with their affirmations of positive thought, the principal radical thinkers of the country. * * * There is not an article in it which a thinking man can afford to skip, and if the periodical can be maintained at its present level, it will speedily become one of the influential papers of the United States, in all that pertains to vital thinking. It will be an honor to any man to reach the public through its columns.—*Boston Daily Herald*.

Typographically speaking **THE OPEN COURT** makes a handsome appearance, as it is neatly printed, and its contents are rather interesting, being a decided improvement on any other religious journal that comes to this office, now that the *Index* has disappeared.—*Boston Investigator*.

The first number just out, is a notable issue both in contents and typographical appearance, and is a worthy champion of the cause to which it is dedicated.—*Boston Budget*.

It will doubtless find readers to whom it will become a necessity and an efficient helper.—*Chicago Tribune*.

It was to late last week, when we discovered our new contemporary, **THE OPEN COURT**, nestling among our exchanges, to extend to it a fraternal welcome. We stretch our hand across the continent, however, this week, to shake hands with this new representative of free thought. **THE OPEN COURT** is what in the West would be called a "broad-gauge" paper, and it starts with a good head of steam and well-laden columns. From the *Register's* standpoint, it does not seem exactly as if **THE OPEN COURT** were on the right track, theologically; and, if Orthodoxy is right, the final experience of our contemporary must be one of wreck and conflagration. But we are glad to say that it exhibits high ability as well as freedom in thought; and we may be sure, under Mr. Underwood's editorship, that its moral tone will be lofty and commanding.—*Christian Register*.

The number before us is beautifully printed, and judging from the cursory perusal we have been able to give it, is able and entertainingly edited.—*Dowagiac (Mich.) Times*.

Both in appearance and matter it is attractive.—*Unity*.

The first issue gives promise of a brilliant career.—*Sentinel Advertiser*, (Hope Valley, R. I.)

It is a fortnightly journal, very handsomely printed, neatly made up, and one of its good features is that it is of convenient size and form for references and binding. A hasty inspection leads us to anticipate much pleasure from its fortnightly visits.—*Mt. Desert (Me.) Herald*.

It is a successor of the Boston *Index*, which was the organ of Free Religious Movement, but on a somewhat more "advanced" plane. Its contributors represent all phases of religious thought.—*Ottawa (Ont.) Free Press*.

The Open Court.

A FORTNIGHTLY JOURNAL,

DEVOTED TO THE WORK OF ESTABLISHING ETHICS AND RELIGION UPON A SCIENTIFIC BASIS.

VOL. I. No. 4.

Three Dollars per Year.
Single Copies, 15 cts.

A HINT FROM FRANKLIN.

BY JOHN BURROUGHS.

In his autobiography, Franklin speaks of a certain sect of the Dunkers of his time, who had wisely refused to print their confession of faith, lest as they progressed in spiritual knowledge, they be too much bound by it and it prove a bar and a hindrance to them. "When we were first drawn together as a society," said the Dunker, "it had pleased God to enlighten our minds so far as to see that some doctrines which were esteemed truths were errors and that others which we had esteemed errors were real truths. From time to time he has been pleased to afford us further light, and our principles have been improving and our errors diminishing." Franklin adds, that "this modesty in a sect is perhaps a single instance in the history of mankind, every other sect supposing itself in possession of all truth, and that those who differ are so far in the wrong; like a man traveling in foggy weather, those at some distance before him in the road he saw wrapped up in the fog as well as those behind him, and also the people in the fields on either side, but near him all appears clear, though, in truth, he is as much in the fog as any of them." These Dunkers were indeed wise in their day and generation, and Franklin himself was, perhaps, as little in the fog engendered by narrowness and dogmatism as any man of his times. If there is one thing certain in the history of mankind it is that sects do outgrow their creeds and are compelled to pull down and build larger or else be terribly pinched for room. Probably every one of the evangelical churches is to-day more or less pinched by its confessions of faith. No one can read the debate of the Congregational ministers last fall at Des Moines, on the subject of Foreign Missions, Future Probation, etc., without seeing how keenly the finer and more expansive spirit among them felt the hard limitations of their creed. The Andover professors have tried to enlarge the creed a little, or rather, they have tried to stretch it so as to make it less galling to the modern humanitarian feeling, and for this they are now arraigned, and by many of their brethren, already condemned. What pagans and heathens most of us still are in opinion, hardly yet more than half liberated from the most groveling and materialistic superstitions of the pre-Christian world. Heaven is still a place with our creed makers, hell is still an infernal abode, God is still

a Moloch or a Baal, Christ is still the victim sacrificed upon the altar to conciliate an offended deity, religion is still a doctrine and a ceremony, man is still the spirit of capricious and super-human powers; justice is still reprisal and reversal; there is wrath and a feeling of destruction in heaven, and the day of judgment is still an assizes adjourned to some future time. Creeds in our day harden the heart; they shock our religious sensibilities; they make atheists and scoffers.

In a city near me, there is a large cemetery, in a neglected corner of which is a multitude of children's graves which have the appearance of being outcasts, reprobates; and so they are. These children were not baptized, therefore they cannot be buried in consecrated ground; their blameless little souls are in hell, and their bodies are huddled together here in this neglected corner. This is a glimpse of the beauty of the Catholic creed. The Jewish Papalists used to believe that the utterance of certain magical words engraved upon the seal of Solomon would transform a man into a brute, or a brute into a man. The Catholics ascribe the same magical power to water in the hands of a priest. When the service is read and the unconscious infant is baptized, at that moment a miraculous change is wrought in its nature, and Rome says, with true Christian charity, "let him be accursed" who believes it not. The mere knowledge of such things is hurtful. And it requires rare Christian forbearance to read the Andover creed, and not fall from the grace of brotherly love. Is it not easy to see what short work Jesus would have made of these creed mongers, the friend of publicans and sinners, the rebuker of formalists, the contemner of life service, who laid all the emphasis upon the condition of the heart and the attitude of the spirit, who said to the chief priest of the popular religion of his time: "The publicans and harlots go into the Kingdom of Heaven before you?"

Our doctors of divinity talk glibly of the growth of religious thought, but seem to lose sight of the fact that growth of religious thought means more or less a decay of old beliefs. There is no growth in anything without a casting off and a leaving of something behind. Growth in science is to a great extent the discovery of new facts and principles, which render the old theories and conclusions untenable. See how much we have had to unlearn and leave behind us by reason of Darwin's; labors and

further advances already lessen the significance of some of his principles. But it may be said that religion has not to do with outward facts and laws like science, but with inward spiritual conditions. Then why seek to embody its final truths in formal propositions, as if they were matters of exact demonstration like science? The creeds treat religion as objective fact, something to be proved to the understanding and to be lodged in a system of belief, like any of the teachings of physical science. Regarded as such, it is always exposed to the inquiry: Is it true? Is it final? Does it agree with the rest of our knowledge? Does it keep pace with the progress of science? If it is a subjective condition, if the Kingdom of Heaven is really within, as Christ taught, then the expression of it in outward forms of belief and creed must change as much as any other philosophy or metaphysics change. A noble sentiment mankind will doubtless always admire; a heroic act, self sacrifice, magnanimity, courage, enthusiasm, patriotism will always awaken a quick response; so will religion as devotion, or piety, or love, or as an aspiration after the highest good, but as an intellectual conception of God and of the manner of his dealings with man, it must be subject to change and revision like all other intellectual conceptions. Where actual verification cannot take place as in science or mathematics, belief must forever fluctuate like the forms and colors of summer clouds. The subject of it may always be the same—God, the soul, the eternal life, but the relation of these and their final meanings can never be once and forever settled. Theology is at best only a tentative kind of science. Its conclusions cannot have anything like the certitude of scientific truth because they are not capable of verification. Principal Tulloch in his *Movements of Religious Thought in Britian*, had the courage to say, that “the idea that theology is a fixed science, with hard and fast propositions, partaking of the nature of infallibility, is a superstition which cannot face the light of modern criticism.” Tulloch further indicates that the true rational standpoint as to creeds and formulas, is a profound distrust of them as professing “to sum up Divine Truth. Useful as ‘aids to faith’, they are intolerable as limitations of faith.” And “limitations of faith” most of the creeds undoubtedly are. But the drift of religious feeling, if not of religious opinion, is undoubtedly away from them. Most Churches keep their creed pretty well in the back ground. When has any one heard a doctrinal sermon? The creeds have been retired to the rear because they are no longer available in front. The world no longer asks what a man believes, but what *is* he? What is his intrinsic worth as a man? Is he capable of honesty, of sobriety, of manliness? Vital original qualities, and not speculative opinions, are certainly what tell most in this world, however it may be in the next. Religion as a sentiment is strong in these times, but religion as a

dogma is weak. The growing disbelief of which we hear so much, is a disbelief in the infallibility of dogma, not a disbelief in the need of godliness, purity, spirituality, and noble disinterested lives. These things move us as much or more than ever, but in the creeds we hear only the rattling of dry bones. How had the Puritan theology been sloughed off by Emerson, and yet what a pure, stimulating, ennobling, religious spirit shone in that man, and still shines in his works. The “saving grace” of heroic thought and aspiration, if they ever existed. The same might be said of Carlyle, rejector as he was of the creed of his fathers. “Religion cannot be incarnated and settled once for all in forms of creed and worship. It is a continual growth in every living heart—a new light to every seeing eye. Past theologies did their best to interpret the laws under which man was living, and to help him regulate his life thereby. But the laws of God are before us always, whether promulgated in Sinai thunder or otherwise.” The progress of religious thought that has been made in the last half century is indicated in the writings and sermons of such men as Maurice, Campbell, Erskine, Kinglsey, Stanley, Arnold, Robertson, Tulloch, Maudsley and others in Great Britain, and in those of Emerson, Parker, Hedge and Mulford, in this country—a progress from the bondage of the letter of the law into the freedom of the spirit. When we think of what these men have said and done, we may look forward with some confidence as Goethe did to a time when “all of us by degrees will learn to elevate ourselves out of a christianity of catechisms and creeds, into a christianity of pure sentiment and noble action.”

JEPHTHAH'S DAUGHTER AT HONOLULU.

BY MONCURE D. CONWAY.

The Princess Like Like, of the Sandwich Islands, has just died in her youth. She had received an American education, had married an American, and had before her a flowery path to the crown worn by her brother—for she was the youngest sister of Kalakaua—when she was done to death as a sacrifice to Pele. It is the old “theology in the island” that eruptions of the volcano Mauna Loa signify the wrath of Pele against mortals generally, and that the dread goddess can only be appeased by the sacrifice of a member of the royal family. “They had not,” says the correspondent of the *New York Herald* (March 8), alluding to the Kahumas, “far to search for one who would make the fearful sacrifice, and while the rumbling of the volcano made awful thunder the Princess Like Like announced to the people that she, the sister of the king—the nearest to the throne—would lay down her life to stop the fearful flow. She openly proclaimed that she gloried to make a martyr of herself for her country and her people; and though in the prime of life, and with the prospect of a crown

before her, she made her final preparations and lay down to await the end. It is said that in this final proceeding the Kahunas played no unimportant part, and that while acting as her guardians and advisers they were, in fact, practising their dark arts upon her and hurrying her onward to the end. For days and days she lay among these people, and during all that time not a partial of food was allowed to pass her lips. She died of starvation at last, lay in state twenty days, and was laid in the royal mausoleum February 28, 1887. The strangest part to tell," adds the correspondent of the most widely circulated paper in Christendom, "is this, that upon the day of her death Mauna Loa, the Awful, ceased to belch its lava forth, and for days after was in comparative quiet, and then the hoary old soothsayers went about among the people with many a nod and mystic sign, as who should say, 'Didn't we foretell all this?' and to-day their power is greater in the land than since the days when Captain Cook laid his bones upon their sandy beach."

Many a tender-hearted woman, reading this tragical narrative, will ask, "Where were the missionaries?" I can answer such from personal knowledge. American protestant missionaries have for generations held complete possession, morally, of the Hawaiian Islands. They are chiefly of New England origin and have been able to establish there the nearest thing to the old Puritan government now surviving on earth. The sacred sawisans are not fossilized in the Sandwich Islands; they poison all that paradise of coral and flowers. A man may be imprisoned at Honolulu for riding on the Sabbath. I was one of a company compelled to pass a Sabbath there; it was a fearfully hot September day, but no one was allowed to sell our ship a lump of ice, nor could we buy a glass of soda-water. The whole Sabbath atmosphere was that most congenial to human sacrifice. It were, perhaps, not wonderful if the young princess, like Electra of old, desired to get out of it all and find a repose unvexed by any gods. From what I learned of Christian theology in the Sandwich Islands while there, four years ago, it has but given new lease of life to the native theology. Both of these theologies have a common source. They rolled out of the cruel phenomena of nature. They

"Came
Like the volcano's tongue of flame;"

even like the fiery vomit of Mauna Loa. The "Mountain Fiend," as the *Herald* calls Pele, is but a hag Jehovah. How often had the Princess Like Like, sitting in church with her American husband (A. B. Cleghorn) and her little daughter, heard her minister read about the biblical Pele? "And Mount Sinai was altogether on a smoke, because the Lord descended upon it in fire; and the smoke thereof ascended as the smoke of a furnace, and the whole mountain quaked greatly." "And the sight of the glory of the Lord was like devouring

fire." "And he said unto them, thus saith the Lord God of Israel, Put every man his sword by his side, and go in and out from gate to gate throughout the camp, and slay every man his brother, and every man his companion, and every man his neighbor. And there fell of the people that day about 3,000 men. For Moses had said consecrate yourselves to-day to the Lord, even every man upon his son, and upon his brother; that he may bestow upon you a blessing this day." How many young Like Likes were sacrificed that day to appease the "Devouring Fire," and to secure blessings for their survivors!

How many sermons had this sacrificed Hawaiian princess heard representing God as a Consuming Fire, whose wrath had been soothed, whose remorseless law satisfied, only by the death of a member of the royal family?

The ancient Hebrews frankly preserved, what modern Hebrews try to explain away by casuistry, the story of Jephthah's sacrifice of his daughter to Jehovah in fulfillment of a pledge to do so if Jehovah gave him a victory. Jephthah's faith is praised by Paul. It is the opinion of Froude, and other eminent scholars, that the Greeks got hold of a version of this same story, and that "Iphigenia" is really "Jephthah-genia." Whether the two stories are variants of the same or not does not matter, however, they are the same in theological origin. But there is a striking difference between the use made of this idea of human sacrifice by ancient Greeks and modern Christians. The Christian plan of salvation sets before us an offended God (or Law) satisfied by a spotless and royal human victim who takes the place of the human race and suffers the vengeance which would have fallen upon them. The doctrine based on this is that we should praise and worship both the avenger and his victim and regard the scheme as an expression of divine wisdom and love. Now the Greeks set before us an offended goddess, Artemis, who vents her fury on the fleet of Agamemnon, king of men, because of some offense to her divine privileges by one of his royal ancestors—offense small as eating a forbidden apple. It is decided by the priests (Kahunas of the time) that the fleet can only move and victory be won if Agamemnon's daughter, Iphigenia be sacrificed. This is done. The imputed sin is requited by vicarious suffering of the innocent. Agamemnon moves on, prevails, and returns home amid the wild delight of his people.

But just here the Greeks bring in another figure—Clytemnestra. She—the mother—cares little for the victory. She asks for her daughter who accompanied the fleet—her beloved Iphigenia. She is told the story. With her own hand she slays Agamemnon. That is Greek theology. The king cowering before Artemis in heaven learns that there is a Clytemnestra on earth. Humanity also has its rights and its vengeance. Clytemnestra is the Greek criticism on the Jephthah story.

The Hebrews did not report what Jephthah-*genia's* mother thought of the proceeding of the Israelitish captain. The Greeks supplied that omission.

Christianity refused the Greek hint. It accepted the primitive savage notion. Abraham's arm stayed, when about to sacrifice his son, became the line of Jewish theological evolution. But Christendom selected for its basis the unarrested human sacrifice—unarrested by any angel, unavenged by any Clytemnestra. With Jephthah's faith it subdued Greece and stopped the mouths of poets. It established in Europe the volcanic theology of Mauna Loa. It added millions of victims to the 3,000 massacred before the Devouring Fire of Sinai. The deified Devouring Fire and its deified victim were established also in America. For two hundred years this virgin land was victim of a dogma more cruel than its wildest aborigines ever devised. But at length, in the Athens of America, Clytemnestra appeared. Channing appeared, and Parker, and Emerson, and Ballou. Through them spoke humanity, and by her maternal hand this Agamemnon theology—this throned cowardly sacrificer of men to gods—was laid low. Unfortunately, however, it was not slain. It fled from the centres of American culture to take up its abode, and rebuild its empire, among helpless and ignorant islanders, in whose horrible devil-worship it finds natural habitat.

Despite the death of its latest victim, the Princess Like Like, Mauna Loa is still belching out its brimstone. This same paper tells us that its red dust has settled down in some Western city. The theological dust of Mauna Loa may be recognized in that Congregational Assembly in Chicago which declined to sympathise with Mrs. Beecher because her dying husband did not believe in eternal hell-fires. No question was raised about anything so unimportant as Beecher's morality, or the Assembly's humanity. The Devouring Fire was alone important. Everything must be sacrificed to that. These men are a thousand years behind ancient Greece. Their Madonna is Pele. Their theology was all belched out of Mauna Loa.

MORAL UNITY.

BY WILLIAM J. POTTER.

One of the basal facts of the science of ethics is the moral unity of the human race. This, of course, is not to say that among all races and nations there is the same measure of moral light, nor even that enlightened mankind are always uniformly agreed in respect to the application of moral principles. Much less is it to say that all persons are alike zealous in seeking and doing right actions. But what is meant by moral unity among mankind is that, under conditions of normal development, all classes and kinds of men not only have a sense of moral obligation, but substantially agree among themselves in regard to the fundamental principles of

the moral law; and, further, that, with increasing enlightenment and advancing civilization, there is a growing agreement among all races and classes of people concerning the practical application of these fundamental ethical principles.

The moral unity of mankind, historically considered, may be regarded as a comparatively recent discovery. It was one of the common-places of the old theological teaching, and not so very far back, that the moral law was given to man in connection with religious revelation and came direct from heaven; that outside of the Hebrew and Christian religions only a most meagre and inadequate knowledge of moral obligation and moral principles has ever existed; that, even if a few exceptionally intelligent men among heathen races appear to have comprehended a tolerably lofty ethical code, the masses of the people around them were incapable of understanding it and were almost void of moral sense. This was one of the stock-arguments by which it was sought to prove the necessity of a supernatural revelation in order to save mankind from ruin by imparting to the race the true moral code. The same argument was also brought forward to prove the vast superiority of the religion of the Bible to all forms of natural religion. The point was apparently overlooked that both the Old and the New Testaments furnish abundant evidence of the fact that the masses of the people gave little heed to the moral precepts announced therein by such exceptional teachers as Moses, Isaiah and Jesus.

But researches which have been made, especially in the latter half of the present century, in the literature and teachings of the heathen religions of Asia, have disclosed in them a body of moral principles and precepts in entire unity with the best ethical teachings of the Hebrew and Christian Scriptures, and in every important particular as clear in perception and as lofty in tone and tenor. In view of these discoveries, so surprising to the theological mind of Christendom, it is not too much to say that these natural religions have become *revealed* to the modern world; and, in consequence, it is not now a very rare thing to find Orthodox writers admitting that all these religions before Christianity had a measure of divine revelation and guidance. The confirmed theological mind of the old type, however, has not yet been able to adjust itself to this discovery. Therefore it was that President Bartlett, of Dartmouth College, in the recent debate in the Board of Missions over the chances of salvation for unconverted heathen, made the senile statement that, though he had taken pains to look up the matter, he could not "obtain account of more than a dozen or twenty instances" of heathen before Christ who were possibly in a salvable condition. But the adjustment of old creeds to the new Oriental scholarship is taking place. This is one of the things which the New Orthodoxy means.

And the important fact which has been determined by this better information concerning the ethics of the heathen religions of Asia is that the peculiar ethical features which have been supposed to distinguish the moral code of the New Testament can no longer be regarded as unique. Of course it has been known for a good while that Greece and Rome had good moral codes. But it had become the fashion in theological Christendom to explain these codes as the utterances of a few specially bright intellects, upon which Christianity may have cast some of the morning rays of its approaching light. It was also alleged that the classic moral code, though of heroic quality, was not of nearly so high a type as the morality of the New Testament; that it especially lacked the features of gentleness, humility, self-sacrifice, forgiveness, forbearance, resignation, that mark so conspicuously the moral precepts of Jesus. But these discoveries with regard to the Oriental religions—with regard to Buddhism, Brahmanism, and the religions of Zoroaster and Confucius—prove that these very virtues, ordinarily regarded as peculiarly Christian, are the common property of all these Eastern religions. In truth, these are eminently Oriental virtues; and ethical precepts of this tenor are found embedded in the sacred books of all the ethnic religions of Asia, mixed, as in the Hebrew and Christian Scriptures, with a good deal of inferior and extraneous matter, yet, in the one case as in the other, constituting an essential part of the religion of which these sacred books in each case are the accepted authoritative utterance. "Return good for evil" said a Brahman text 1200 years before Jesus taught the ethics of the Sermon on the Mount. "Overcome anger by love, evil by good," is a Buddhist precept of date before Christ. "Be rigid to yourself, and gentle to others," and again, "He is the great man who is strongest in the exercise of patience—who patiently endures injury," taught Confucius; and his fellow-countryman, Laö-tze—the profounder religious teacher of the two—said, "Of all noble qualities, the noblest is loving compassion."

If we regard the more robust moral principles, such as honesty, justice, veracity, self-control, purity, we find a similar unanimity of recognition. "Let a man keep in subjection his speech, his arm, and his appetite," said nanu, of the ancient Hindus. "Fear not poverty, but fear missing the truth," again preached the wise Confucius. "Whatsoever people may think of you, do that which you believe to be right," taught Pythagoras, the Greek. "Blessed are the pure in heart" stands among the highest of Jesus' utterances. But, centuries earlier Zoroaster taught the Persians "to keep pure in body and mind;" that "immodest looks are sins"; that "to think evil is a sin."

Examples like these, to prove the parity of ethical teaching among the different races and religions of

mankind, might be multiplied indefinitely. The historical argument for the moral unity of man is simply overwhelming. Humanity, always and everywhere, and under various conditions of experience, when it has risen to sufficient intelligence to perceive the relations of human acts, has had essentially the same moral perceptions, and recognized the authority and majesty of the same moral law.

In matters of practice, the world, of course, has always been very far from moral unity, and is still a long distance from that goal. Different persons and the ethical codes of different nations may give precisely the same moral judgment of a certain action when considered apart from their own interests; but let self-interest be involved or personal passion be concerned, and immediately the moral perception is likely to be blurred and the action will accordingly be differently adjudged. The practical moral disagreements between individuals and between nations arise from this disturbance of judgment caused by the excess of some motive of self-interest. When we look at the nations of Europe arming themselves to the teeth against each other and ready to send millions of men to battle-fields to defend against each other their alleged rights, it does not seem possible that they should confess the same moral code. And yet they do. And so do the contending and struggling classes that in any single nation are to-day at strife with one another. They all say that they want only justice and equity. But what is justice, what are the requirements of equity, in the special questions at issue, the pressure of self-interest prevents them from seeing together.

Yet in spite of the actual moral disturbance and the fierce physical contentions in consequence, moral unity is still the ideal aim of mankind. It is the central attribute in humanity's vision of a perfected form of society. That the individual members of society, differing in respect to intellectual faculties, services, and power, should see, feel, and live together in entire moral harmony,—this has been man's dream through the ages. It has been the Utopia of social philosophers, the vision of enthusiastic philanthropists, the faith of religions. Nor is this hope of a practical moral unity for mankind to be scoffed at as only an unsubstantial dream; nor is its realization to be put where religion has been too apt to put it, among the mysteries of a future world. It is the hope that gives largest motive, highest dignity, most permanent influence, for human efforts in this present world. It is worth all the struggle and pain of all the past ages, that this creature called man has come, endowed with the power of discerning the right and the true and of putting them into deeds and institutions. He thereby becomes the incarnation and servant of the Eternal Power that makes for righteousness. By their capacity to help toward this end of practical moral

unity, or righteousness, all men, measures, and institutions must be finally judged.

The consummation is, indeed, far off! Individual selfish greed is delaying it. Individual passions and appetites, seeking their own to the sacrifice of the common good, are grievously hindering forces. Moral unity needs first of all to be established in the individual character. Thence the harmony will extend to the family, to the neighborhood, to the community, to the State. Nevertheless, in spite of the appalling obstacles and delays, social progress is made. Vices are yielding to the efforts of philanthropy and to a firmer self-control. Injustices are slowly, but surely, giving way to righteous laws. Old oppressions are loosening their grasp, and their victims are rising up men and free citizens. By and by—some of the younger readers of this number of THE OPEN COURT may live to see it—the warring nations may agree to dismantle their forts, disband their armies, and unite in a confederation of justice and brotherhood. In view of moral and political reforms which have been accomplished, this is no merely visionary prediction. The moral unity will come if men and women will work for it according to their best belief and knowledge.

FLOWERS AND POETS.

BY ANNA OLCOTT COMMELIN.

Saintine, in his charming story of *Picciou*, has shown us how the development and growth of a little plant, with its buds and flowers, saved from weary languishing the poor prisoner of Fenestrelle, restored his reason, health and life, and, in the end, brought to him friendship, liberty and love. Without claiming that all flowers, in all circumstances, can accomplish so much as this, let us consider them in their relation to human life, and the inspiration that they have given to poets. "*Poeta nascitur, non fit*," says the proverb, and in the mind of every one possessed of the poetic fire is born the love of beauty. Says Wordsworth:

"To me the meanest flower that blows can give
Thoughts that do often lie to deep for tears."

The "kindly fruits of the earth" minister to our corporeal needs, besides giving pleasure to the eye, but flowers are almost human in their association with the dearest and holiest sacraments of life. They go with the bride to the altar, and we lay them beside our sacred dead when we dress them for their last, long sleep.

Says Longfellow:

"Bear a lily in thy hand,
Gates of brass cannot withstand
One touch of that magic wand."

"Sweets to the sweet," says Queen Gertrude, when she scatters flowers over Ophelia's lifeless form. Says Browning, "do not the dead wear flowers, when dressed for God?"

From the first chill days of early spring, when the

delicate anemone rises from the wintry ground, until the last frail little waif of a violet, in bleak December, how magnificent and varied is this procession of beauty.

Says Oberon:

"I know a bank where the wild thyme blows,
Where ox-lip and the nodding violet grows,
Quite over-canopied with luscious woodbine,
With sweet musk roses and with eglantine."

Mrs Whitney expresses our feeling in the return of the flowers we have loved in her lines:

"God does not send us strange flowers every year;
When the spring winds blow o'er the pleasant places,
The same dear things lift up the same fair faces,—
The violet is here."

When we read that the violet,—our violet,—was known in the time of Homer, we think of the favorite poem of Lincoln, and the lines:

"We see the same things that our fathers have seen."

In Cowper's translation from Homer we read:

"Everywhere appeared
Meadows of softest verdure purpled o'er
With violets; 't was a scene to fill
A god from heaven with wonder and delight."

Lady Wilkinson, in her book on flowers, gives many interesting particulars concerning the violet. It must have been greatly in favor with the Romans, she tells us, as they called their days set apart for decking graves, "*Dies Violaris*." Pliny thought that violets were of medicinal value, and advised that garlands of them should be worn on the head. Different varieties of this flower grow in many parts of America, Palestine, China, Japan, Europe, and even on the Swiss Alps, and the ruins of the Colosseum at Rome. Its praises, we are told, have been written in many languages. Abou Rumi, an Eastern poet, says, "it is not a flower; it is an emerald, bearing a purple gem." The Arabs, it is said, compare the eye of a beautiful woman to a violet. Homer speaks of Venus as crowned with violets, and Theocritus thought that these flowers were specially desirable for wreaths. Aristophanes spoke of Athens as "violet crowned," and Dioscorides makes mention of the flower. In modern times this favorite, with its meanings of truth, modesty and love, is spoken of by Shelley, in these lines:

"Lilies for a bridal bed,
Roses for a matron's head,
Violets for a maiden dead."

Daisies are found so universally that a British poet calls them "the constellated flowers that never set."

Chaucer says:

"Above all flouris in the mede
Than I love most those flouris white and rede,
Such that men callen daisies in our town."

In his legend of "Gude Women," he gives a poetical version of the origin of the daisy. It is pleasant to know that Linnæus himself may have inherited a love of flowers from his father, but when we read a botanical definition of a daisy as a "scape, one-flowered, with leaves spatulate, single-ribbed, obovate, crenate," we

turn with satisfaction to Burns, in his address to the "wee, modest, crimson-tipped flower."

Wordsworth says:

"Methinks that there abides with thee
Some concord with humanity,
Given to no other flower I see
The forest through."

Sweet and tender and sad are the associations of the daisy with the frail genius of the poet Keats, who knew not of the immortality that time would bring him, when he composed his own epitaph, and felt, only a few days before his death, the "daisies growing over him."

Lucy Larcom, in our own day, writes gracefully of "golden daisies:—"

"Disk of bronze and ray of gold
Glimmering through the meadow grasses
Burn less proudly! for behold
Down the field my princess passes.
Hardly should I hold you fair,
Golden, gay midsummer daisies,
But for her, the maiden rare,
Who, amid your starry mazes,
Makes you splendid with her praises."

The "Flowers of the Fallow" is another lovely poem by this writer:

"I like those plants that you call weeds,
Sedge, hardhack, mullin, yarrow,
That knit their roots and silt their seeds
Where any grassy wheel-track leads
Through country by-ways narrow.
They fringe the rugged hillside farm
Grown old with cultivation,
With such wild wealth of rustic charms
As bloomed in Nature's mastic arms
The first days of creation."

It is hard to refrain from quoting all the verses, but we have cullings from many authors, in a field which comprises all lands and all ages, and where the only embarrassment is one of riches. To mention the name of Bryant is to bring up a host of tender and beautiful associations of poetry and nature's charms. One hardly knows which to love best, the golden rod which suggested the verse of his poem, or the verse which has immortalized the golden rod. The lines are so familiar to all that some less known but well worth knowing will be more appropriate to introduce here, by Jennie Maxwell Paine.

"Open the bars and make me room.—
Let me wade, waist-deep, in the yellow bloom,
Let me revel at will, let me gather my fill,
Let me touch their plumes with reverent hands,
Let me tread where the wealth of blossom stands,
With the pomp of gold, in the glowing lands.
Fine as feather and soft as down
Is its petaled plume,—the very crown
Of the fair and the fine and the rare design!
Fair as the ore, when wrought and rolled,
Fine as the fretting of filagree gold."

When we read of the thistle of Scotland, the fleur-de-lis of France, with the daisy as the badge of the beautiful province of Languedre, and the rose of England, we could wish that the possession of a national floral emblem were ours, though the choice of one "bright, consummate flower" would be attended with difficulties. Here, in the length and breadth of our own

America, with its wealth of flowers, one can think of none so national in character as we find in other countries. Is not the harebell immortal in its association with the name of Ellen Douglas and Scotland?

The fragrance of flowers has the power to recall recollections of the past, since the sense of smell is more intimately connected with the power of memory than with sight or hearing. Perhaps this may be another reason why flowers are so much beloved by poets. A different sentiment, the expression of his Pantheistic thought, is shown in Omar Khayyam's wonderful poem of the Rubaiyat:

"I sometimes think that never blows so red
The rose as where some buried Caesar bled;
That every Hyacinth the garden wears
Dropt in her lap from some once lovely head.

And this reviving herb, whose tender green
Fledges the river lip on which we lean,
Ah, lean upon it lightly! for who knows
From what once lovely lip it springs unscen!

Shakspeare expresses a similar idea:

"Lay her i' the earth,
And, from her fair and unpolluted flesh,
May violets spring."

And Herrick says:

"From her happy spark here let
Spring the purple violet."

And George Eliot:

"Is there not a soul—half nymph, half child—in these delicate petals which glow and breathe about the centres of deep color?"

The rose, supposed to be a native of Syria, seems to have been known in earliest history. Mention is made in the Iliad of ointment of oil perfumed with roses, with which Venus anointed the body of Hector, and Hector is spoken of as using the same "ambrosial lymph" in Cowper's translation. Roses were worn at the feasts of the ancients, and at the banquets of Cleopatra. They were much used to decorate tombs, and it is said that the Romans provided for this observance in their wills. Anacreon thought that the rose had power to protect the dead. Didymus, the Alexandrian, was persuaded that the "rose was something more than human." Sappho is said to have written verses to this flower, and Dryden, in his translation from Virgil, speaking of Æneas at the tomb of his father, Anchises, says:

"With roses then the sepulchre he strewed,
And thus his father's ghost bespoke aloud."

Pliny says that this flower was much cultivated by the Romans, and used as a perfume for anointing the body. Gerarde thought that the rose was useful for "strengthening of the heart, and refreshinge of the spirits, and profitable for other griefes."

In our day, Aldrich alludes to roses in one exquisitely tender verse.

"We wove the roses round her brow—
White buds, the summer's drifted snow—
Wrapt her from head to foot in flowers. . . .
And thus went dainty Baby Bell
Out of this world of ours."

The meanings that are attached to flowers would

form an interesting study. Many sentiments can be expressed and replied to in their interchange. In Shakespeare's time this was thought of, since Ophelia said:

"There's rosemary, that's for remembrance: there's pansies, that's for thought."

The English poet, Horace Smith, has written a "Hymn to the Fowers," one stanza of which we quote:

"Floral Apostles! that in dewy splendor,
Weep without woe, and blush without a crime,
Oh may I deeply learn and ne'er surrender
Your lore sublime."

Wordsworth was a genuine lover of flowers, and said, "and 'tis my faith that every flower enjoys the air it breaths," giving to them consciousness of being. When he says:

"My heart with rapture fills
And dances with the daffodils,"

one feels with him a throb of delight. Shelley shows his affection for all flowers in his verses to the sensitive plant in which occur these lines:

"Narcissi, the fairest among them all
Who gaze on their eyes in the stream's recess,
Till they die of their own dear loveliness."

In our own day, Anna C. Brackett in her "Vacation" poem, discourses eloquently:

"When did we leave the Michigan woods?
I only know
That clusters of asters, purple and white,
And the golden rod, like a flash of light,
Had set all the roads aglow."

Holmes, in his beautiful sonnet, "nearing the snow line," speaks of the "slender flowerets, scentless, pale, along the margin of unmelting snow." Emerson writes to the rhodora, speaks tenderly of the wood-rose in "Forbearance," and in his poetical, prose paragraph, describes the edelweiss, flower of noble purity. With Lowell, in his sweetest of love songs, "Auf Wiedersehen," we breath the very fragrance of the lilacs. Truly,

"The poet, faithful and far-seeing,
Sees alike in stars and flowers a part
Of the selfsame universal being
Which is throbbing in his brain and heart."

Not alone the poet, but all who possess the love of beauty, and who feel glowing in them the enthusiasm every flower that blows, gladdening the eye, delighting the sense, must feel that it is well indeed to consider the "flowers of the field," for truly "Solomon in all his glory was not arrayed like one of these."

THE BLUE LAWS.

BY FREDERIC MAY HOLLAND.

This name seems to have been first used of the early statutes of New Haven, some of which are spoken of under this title in the *General History of Connecticut*, by Rev. S. Peters, a tory refugee. The little book, which was first published in 1871, and has been recently reprinted, is very readable, but by no means trustworthy. Peters proposes to give extract from enactments which were never allowed to be printed, and which "were

properly termed blue laws, *i. e.*, bloody laws, for they were all sanctified with excommunications, confiscation, fines, banishment, whippings, cutting off the ears, burning the tongue and death." "Similar laws still prevail over New England as the common law of the country," adds Peters, who undertakes to "give a tolerable idea of the spirit which pervades the whole," by stating forty-five of the enactments of New Haven. This colony, it should be noticed, was not united to Connecticut until 1665; and its first code was avowedly based on the Bible, so that the edition of 1650 is as full of references to texts as any catechism.

From this code and other records, it is plain that Peters was right more than half the time. Of his forty-five blue laws twenty-four, at least, were substantially in force. Among those that must have been peculiar to New Haven are the following: "The judge shall determine all controversies without a jury." A debtor in prison, swearing he has no estate, shall be let out and sold to make satisfaction," and "married persons must live together or be imprisoned." Then there are others, common to New Haven and other colonies at first, but gradually modified; like those which allowed only church members to vote or hold office; which made conspirators, Quakers, adulterers, and men-stealers liable to be hung, and liars to be whipped; and which provided that "No gospel minister shall join people in marriage," that "The sabbath shall begin at sunset on Saturday," and that "No man shall court a maid in person or by letter without first obtaining consent of her parents." This statute was often enforced in New Haven. On May-day, 1660, a special court, whose record may be found in the *Blue Laws of Connecticut*, by Silas Andrus, was held by Governor Newman to try Jacob M. Murline and Sarah Tuttle. The girl had made some jokes too much like those of Shakespeare's heroines, to Jacob's sisters. Then he came in, snatched up her gloves, and refused to give them back unless she would kiss him. This she denied having done; but the sisters testified that she had; and the Governor decided that she was guilty. She did not deny that Jacob had kissed her, or that they had set side by side for nearly half an hour, with their arms about each other, and his sisters looking on. Her father charged Jacob with trying to inveigle her into marriage; but she denied it so firmly as to save him from punishment for this crime. Jacob, on being asked "whether his arm was about her waist, and her arm upon his shoulder or about his neck," said "he never thought of it since," "for which he was blamed, and told he had not laid to heart as he ought." The court further decided that "his carriage hath been very corrupt and sinful, such as brings reproach upon the family and place." Sarah was scolded by the Governor, until she "professed that she was sorry she had carried it so sinfully;" and the criminals were fined

twenty shillings each, at a time when the most skillful workmen was forbidden by law to earn more than two shillings a day. Peters does not mention this last statute, nor that under which Jacob and Sarah were fined, as I suppose, namely that re-enacted the same month, to punish all persons who "meet, or company together in any kind of vain manner or unreasonable time, whether by day or night, to mispend and waste the precious talent of these gospel seasons of grace," etc. This statute of May 30, 1660, also forbids "corrupt songs and foolish jesting," "mixt dancings," "immoderate playing at any sort of sports or games, or mere idle living out of an honest calling industriously, or extravagant expenses, by drinking, apparel etc," as is mentioned in Hoadly's *New Haven Colonial Records*, pp. 336-7. After New Haven became a part of Connecticut, a fine of twenty shillings was imposed on any one who should play at cards or back-gammon, or suffer it to be played in his house; and enough of this hatred of amusement remained in 1849, to cause all dramatic performances, exhibition of trained animals, etc., where there was a charge for admission, to be prohibited under a fine of \$50. One of fifty cents was incurred in 1808 by absence from church, or failure of the parent or guardian to inflict punishment, in the presence of some officer, on any child under fourteen who broke the Sabbath.

Some of the worst laws which New Haven took from the Bible are not mentioned by Peters, namely those to inflict death for worshipping "any other God but the Lord God;" "witchcraft," "willful or obstinate denying the true God, or his creation or government of the world," or uttering "any other blasphemy of the like nature;" manslaughter committed "suddenly in anger or cruelty of passion;" attempt at murder; or profaning the Sabbath "proudly, presumptuously and with a high hand." This last statute was peculiar to New Haven; and so was that by which maiming others might be punished, "eye for eye, tooth for tooth, hand for hand, foot for foot." Witches were hung there as well as at Hartford; "a stubborn and rebellious son" of sixteen, might be put to death in either colony; and Voltaire, Holbach and Diderot might have been hung in Connecticut, where blasphemy was a capital crime until 1784, when the penalty was reduced to forty stripes on the bare body, and one hour in the pillory. In 1673 it was decreed, that adulterers should no longer be hung, but have the letter A branded on their foreheads with a hot iron. New Haven burglars were to be branded on the right hand with B. Each of these infant colonies had a fine of five shillings for every absence from church; and whoever interrupted the preacher in Connecticut, or charged him falsely with error, had for the second offence to "either pay five pounds to the public treasury, or stand two hours openly upon a block or stool four

foot high, upon a lecture day, with a paper fixed in his breast written with capital letters, AN OPEN AND OBSTINATE CONTEMNER OF GOD'S HOLY ORDINANCES, that others may fear and be ashamed of breaking out into the like wickedness." It was ordered at Hartford, in 1676, that all heads of families who obstinately neglected "reading of the scripture, catechising of children, and daily prayer, with giving of thanks," should be "fined, or punished, or bound to good behavior, according to the demerits of the case." Both New Haven and Connecticut forbade any man to live alone, or any family to take a lodger without leave from the magistrates. A license from the legislature, as well as a certificate from the doctor, had to be procured before tobacco could be used by any one under twenty, or by any one else who had not formed the habit. This was voted at Hartford in 1647, when it was also ordered: "That no man within this colony, after the publication hereof, shall take any tobacco publicly in the streets, nor shall any take it in the fields or woods, unless when they be on their travel or journey at least ten miles, or at the ordinary time of repast commonly called dinner, or if it be not then taken, yet not above once in the day at most, and then not in company with any other. Nor shall any inhabiting in any of the towns within this jurisdiction take any tobacco in any house in the same town, where he liveth, with and in the company with any more than one who useth and drinketh the same weed." This ordinance, like that of 1659 against "disordered meetings of persons in private houses to tittle together," and that of 1673, by which young persons and servants were not to meet together in the streets or fields or in any house "after the shutting in of the evening," without consent of their parents or masters, shows the same ascetic principle as the punishment of Sarah Tuttle. When I consider farther that ships were forbidden in 1673, to set sail out of any harbor in Connecticut on Sunday, I am inclined to think that Hinman, who was Secretary of Connecticut for seven years, may have had some authority for inserting in his *Blue Laws of New Haven Colony*, in a list which is otherwise undoubtedly correct, the following enactment, apparently taken by him from the original records: "If any man shall kiss his wife, or wife kiss her husband, on the Lord's day, the party in fault shall be punished at the discretion of the court of magistrates," p. 130.

Neither this, nor any other of the laws mentioned in the last paragraph, is given by Peters. So it must be said, that his picture is not on the whole any bluer than the reality, though he does put much of his paint in wrong places. For instance, he says that criminals could be tortured at New Haven, which seems to have been done only at New Amsterdam while under the Dutch. What he says about hanging Catholic priests is more nearly true of the New York law of 1699 than of

that of Connecticut. He was undoubtedly in error, though I think innocently, when he charged New Haven with forcing every voter to swear, "that Jesus is the only king," and ordaining that: "No one shall run on the Sabbath-day, or walk in the garden, or elsewhere, except reverently to and from meeting;" "No one shall travel, cook victuals, make beds, sweep house, cut hair, or shave on the Sabbath-day;" "No woman shall kiss her child on the Sabbath or fasting-day;" "No one shall read Common-Prayer, keep Christmas or Saints'-days, make minced pies, dance, play cards, or play on any instrument of music, except the drum, trumpet, and Jesus-harp;" "Every male shall have his hair cut round according to a cap."

This last law, however, is still enforced by public opinion in all civilized lands. Even the most conservative and aristocratic gentlemen have become Round-heads. Some of the other precepts just quoted were observed in Connecticut families when Peters lived there; and the Legislature of Massachusetts is now deliberating whether it will do to let barbers cut hair or shave on Sunday, or make it legal for milk to be delivered, for prescriptions to be put up, for horse-cars to run, for dispatches to be sent by telegraph or telephone, for newspapers to be sold or printed, etc. Among other questions now being agitated in Boston is the propriety of abolishing the statutes against Sunday travel and Saturday evening amusements. The general blueness of our Sunday laws is seldom realized; but a full and accurate account of the various statutes in the different states and territories will be found in the *Outlook and Sabbath Quarterly* for last January, which may be procured from Alfred Center, N. Y., for twenty-five cents per copy. That author has been able to collect later information in some cases than I gave last fall in *The Index*. Indiscriminate prohibition of Sunday amusements seems to be established in Connecticut, Maine, Massachusetts, Michigan, Minnesota, New Hampshire, New Jersey, Pennsylvania, Rhode Island, South Carolina, Vermont and Wisconsin, besides restrictions of various harmless pastimes in every other state, except California, Colorado, Florida, Georgia, Louisiana, Virginia and Western Virginia. Special laws against theatres have recently been passed in Nevada, New York and Maryland, and the permission to deliver ice was repealed in this last state in 1886.

The worst of our Sunday laws is not to be found in the statutes of any state or territory. It is the decree, every where sacred, of Mrs. Grundy, forbidding any one to amuse himself in public on Sunday. Driving, for instance is permitted, because no one can be sure that it is wholly for amusement. Lawn-tennis, which is much less noisy and throws no needless labor upon animals, is utterly out of the question in good society; as are dancing, archery, private theatricals and picnics.

Cards can be played secretly, but card parties are under the ban, which falls with peculiar severity upon all amusements which may be enjoyed by the poor. There is no need to say much against other Sunday laws, until this unwritten one is reformed thoroughly. When the duty of taking healthy amusement on every day in the week, and encouraging the poor and overworked to get the recreation they need peculiarly, whenever they can, becomes fully recognized by public opinion, there will be little difficulty in getting rid of the last of the blue laws.

LASALLE, March 24, 1887.

B. F. UNDERWOOD, Esq., Chicago, Ill.:

DEAR SIR—I find that in my note in last number introducing two articles from the *LaSalle Republican*, I have, through inattention, written "I believe *their wishes* to be both sincere from their standpoint," instead of "I believe *these criticisms* to be both sincere from their standpoint." Yours truly,

EDWARD C. HEGELER.

AMENDMENTS AND ANSWER TO CRITICISMS OF HIS ESSAY ON THE BASIS OF ETHICS.

BY EDWARD C. HEGELER.

Proceeding to answer the criticisms to my essay on the Basis of Ethics, I feel that I should properly commence with criticising the same myself. I find that in presenting a number of examples of the use of the word *good*, for the sake of ascertaining its general meaning, I have omitted the most important use of the word under the head "What do we call *good* for man?" viz.: *The ethical teachings we have received in our youth, principally as part of our religious instruction.* While these teachings as far as they were of a supernatural character, gradually weakened in us on our becoming acquainted with modern science, the truth of nearly all the ethics remained unshaken.

Their basis was unclear for a time until now we can say, the *rules of ethics* are those ideas evolved in the past, that in the struggle for existence have evolved from the savage the civilized man of to-day.

Supplemented by further evolved ethical ideas they are the foundation for the preservation and further evolution of civilized man.

I should also have mentioned another class of uses of the word *good*, where only a pleasant sensation is meant; we say, "the sugar tastes good," "the rose smells good," "this musical chord sounds good." While we may assume that the effect of these excitations of the nervous system in some way favors its growth, we do not think of this in so using the word *good*.

Looking over the comments made, I notice especially the remark that I had not done justice to Mr. Spencer. I should mention that it was in part a thought of this, why I asked Mr. Bradley, who is known to be

versed in Spencer's views, to state his position. Mr. Bradley's statements have since been supplemented in the comments by others.

I deem it my duty to express here in reference to Mr. Salter's remark, "for myself I would say that in searching for the truth, I would rather be baffled a thousand times and have the discomfort and sense of frustration accompanying such experiences, if the thousand and first time I found the truth, than to forego the search at the outset, because I knew there would be more pain than pleasure attending it," that I hold that Mr. Spencer considers this searching for truth as a high pleasure in itself; and that in his theory he considers the amount of attainment, physical, intellectual and moral, as great happiness to the individual and the race.

How strong Mr. Spencer thinks in this way is shown in a statement in the introduction to his *Data of Ethics*, which appears to me as a powerful demonstration that a grand and lofty idea is in persons of ethical tendencies or high aspirations, their real self and their better ego, for the continuance of which they often freely spend their wealth, devote their labor, and even sacrifice their lives. Let me quote it here:

"I have been led thus to deviate from the order originally set down, (for the publication of the *Synthetic Philosophy*), by the fear that persistence in conforming to it might result in leaving the final work of the series unexecuted. Hints repeated of late years with increasing frequency and distinctness, have shown me that health may permanently fail, even if life does not end, before I reach the last part of the task I have marked out for myself. This last part of the task it is to which I regard all preceding parts as subsidiary. * * * from that time onwards my ultimate purpose lying behind all proximate purposes, has been that of finding for the principles of right and wrong in conduct at large, a scientific basis. To leave this purpose unfulfilled after making so extensive preparations for fulfilling it, would be a failure the probability of which I do not like to contemplate."

In my essay I have presented the view in opposition to Mr. Spencer's, that not happiness *but evolution itself* (expressing it in a word) is the Basis of Ethics. By a closer examination of Herbert Spencer's studies on the meaning of the words *good and bad* in his *Data of Ethics*, I find I must contest the truth of his conclusion that good and bad are equivalent to "well or ill adapted or adjusted to ends," which must mean *more or less* adapted or adjusted to ends. Mr. Spencer says, "the good knife will cut." This can be considered only as an abbreviated sentence, for any knife cuts or is adapted to cutting. A *good* knife is one with which the person using it can, by the same labor, achieve more cutting than with an average knife.

An umbrella is called *bad* if it protects the bearer from rain less than the average umbrella.

"We call a day *bad* in which storms prevent us from satisfying our desires." Also here, in using the word *bad*, we compare the weather to ordinary weather. It is *bad* also by being destructive to our intended occupation. The energy or capacity for it we had, and it is considered to be wasted.

A good jump is one which achieves the immediate purpose of said jump, while judging from the results of many similar jumps that it could not be achieved. There is more achieved than ordinarily.

A stroke at billiards is called good when the movements are more skillfully adjusted to the requirements than they ordinarily are, the stroke being successful or not. A person looking at the play not acquainted with the billiard game is unable to express an opinion whether the stroke was good or bad.

These doings of man are not considered as good or bad, according to their success or failure (the billiard stroke may fail and nevertheless be good) but in comparison of their results to those of the average doings of the same class.

"A mother is called good who ministering to all the physical needs of her children, also adjusts her behavior in ways conducive to their mental health." It is assumed here that the mother expends a certain quantity of her energy in ministering to all the physical needs of her children; the expenditure of this quantity of her energy in her conduct affects the mental health of her children at the same time, and in this respect stands in the condition of a natural adjustment, as that may happen to be. By her behavior being more adjusted, the mother's same energy results in greater mental health to her children, a result being in the direction of higher evolution.

(TO BE CONTINUED.)

SUNDAY WORSHIP.

BY CHARLES K. WHIPPLE.

One of the most vivid shocks given by the late Theodore Parker to the theological sensibilities of New England was his statement that, in Old Testament Scripture the Jehovah of the Hebrews was represented as fond of "roast veal." The fact of so great a shock from so slight a cause is curious, but not inexplicable. It is curious, since the people thus spasmodically affected had all their lives been reading in their "sacred volume" that, on numerous specified occasions, a bullock, a calf, a ram, a lamb, or a kid, was to be killed and roasted by the priest "for a sweet savor unto the Lord," and that the priest must also put twelve loaves of *hot* bread in the holy place before the Lord every Sabbath. It is no more strange that such preferences should have been ascribed to the Supreme Being by the early Hebrews than by the early Greeks and Romans. But our Christianity has its roots so firmly fixed in that ancient Hebraism that, although we may use the utmost freedom

in speaking of Greek and Roman superstitions, any present mention of the cruder peculiarities of the Old Testament faith must be made in that original phraseology which has become sanctified by tradition and custom, if the speaker would avoid the imputation of sacrilege and blasphemy. In fact, Mr. Parker's plain-speaking in modern language frightened the majority of his generation so much that they really thought him an infidel and a scoffer, instead of the devout religious reformer that he really was.

At the present day, one of the great reformatory agencies is the Sunday newspaper. The Sunday press, with some faults as obvious as the opposite faults of the self-styled "religious paper," which it is fast supplanting, is conferring immense benefit on the community in two ways: first, by counteracting that theological blindness which, pretending that one day of the week must be recognized as more holy, *necessarily* allows that the other six days may be esteemed less holy; and next, by supplying reading matter more instructive and beneficial, that is to say, containing more truth and less error, than the average church sermon.

These, as I have said, are very great benefits conferred on the community by the Sunday paper. Seeking to be read by all, it provides something to suit the taste of every class in city and country, the serious and the frivolous, the scientist and the sportsman, the student, the merchant and the politician. Of course, while containing something attractive to each class, it contains much which each class will pass by with indifference. Of course, also, its proportion of sermon-like articles, while sometimes controverting the lessons of the pulpit, will sometimes echo them. In fact, the occasion of my writing at this time is an echo, in the *Boston Sunday Herald* of February 27, of what seems to me one of the erroneous doctrines of the pulpit.

In an editorial article there, entitled "Sunday Morning Worship," it is contended that our Protestant churches err in laying too little stress upon worship (meaning simultaneous confession, supplication and adoration) and too much upon pulpit instruction. The writer complains that these churches give us a very stunted worship of the Divine Being; that all the praying and most of the praise are done by proxy; and that thus the hearty and helpful worship of God is ignored.

There is sound worldly wisdom in this statement of the *Sunday Herald*, since a large number of our clergy and churches have for a year past been moving in that direction, and trying, by attractive additions in the department of worship, to retain the audiences which are slipping away from them, and to draw in outsiders. Sound worldly wisdom: for, while thus adhering to the general idea of the Sunday paper by presenting in its columns something attractive to every class, saints as well as sinners, the editor offers terms of compromise

to the saints, removes one of their objections, and attracts to his support a proportion of those who have hitherto been hostile. Nevertheless, as both the *Herald* and the churches seem to me to be wrong in this matter, I will suggest some reasons for taking the opposite ground, namely—that the chief use, and a most important use, of our excellent custom of holding public assemblies on Sunday is the giving and receiving of instruction, particularly in the departments of morals and religion; in other words, that the sermon, *if it is what it should be*, is the most important part of the Sunday service, and well worth the trouble of regular attendance and the expense of making suitable provision for it.

The *if* in the preceding sentence is a very important word, since its meaning would exclude the great majority of the sermons now preached, and that on both negative and positive grounds; the number of their erroneous and unfounded assumptions, and their positive false teaching respecting both sin and duty. What, then, should a sermon be?

It seems to me that any subject relating to human welfare may properly be treated in the pulpit; yet, since one day in the week is not too much to be devoted to the important departments of morals and religion, I think the chief function of the sermon should be to inculcate righteousness or right living and to oppose vice and error; especially to insist on the duties customarily denied or neglected, and to give warning and admonition respecting the evil practices which are countenanced by fashion or custom. If these things are faithfully done by a competent person, the time given to his instructions and the money paid for his support will be well expended.

But should there be no public worship? Should those observances cease altogether which now form the chief occupation of the Sunday mornings of Roman Catholics and Episcopalians, and which Dissenting congregations seem of late disposed to adopt in greater number and variety? Is there not a strong presumption in favor of a custom so long established, and maintained by people so numerous and so estimable?

I reply, the presumption here supposed would be strong, were there not both authority and reason against it.

First, authority. The clergy of all these sects, Roman, Episcopal and Dissenting, claim to be disciples and ambassadors of Jesus, whom they call Christ. What did Jesus say about public worship?

The four biographical sketches which give us all we know about him contain neither injunction nor recommendation for Public Worship, nor for Sabbath meetings, nor for Sunday meetings, nor for prayer meetings, nor for any sabbatical observance whatever. If Jesus sometimes went up to the Temple on the Jewish

Sabbath, it was not to join in the observances there, but to teach a better method, righteousness instead of sacrifices, rites and ceremonies.

What our clergy inculcate as public worship consists of prayer and praise. Of the former, Jesus said to his disciples, "When thou prayest, enter into thy closet." Reason echoes this injunction, since the desire, the confession, the aspiration which a man wishes to express to the Heavenly Father can best be done in person and in private; and this seems most likely to be that "worship in spirit and in truth" which Jesus enjoined.

As to praise, the other constituent of Public Worship, the multiform variations of applause offered to the Deity weekly in our Sunday assemblies—the sentiment of Jesus respecting it as well as respecting Prayer may be found in his warning against the use of "vain repetitions." And here again reason echoes his injunction. It is the worse sort of rulers and potentates, the poorer specimens of men, who are pleased with public rehearsal of their dignities and merits. It is not an elevated idea of the Supreme Being to suppose that he resembles such persons; that he really desires intelligent human beings to occupy themselves periodically in proclaiming him to be holy, just and good, or in kneeling or prostrating themselves before him as before a Turkish or an Abyssinian ruler! There is no reason to believe that God desires men publicly and periodically to "praise" him. Judging by the teaching of Jesus, what God wants of his human children is *obedience*, the doing of what they understand to be duty in their daily lives. And the true function of the pulpit is to explain and enforce this duty; to teach the people what they do not know in morals and religion, and to remind them of those things which, though known, are apt to be forgotten, neglected or evaded. To do this work effectively is to perform one of the most important services to a civilized community; and if the minister who does this has also skill to teach true reverence and conscientiousness to children, to supply to them, in the departments of morals and religion, that which is lacking in family and school education, he is one of the greatest of public benefactors.

THE ART OF MAKING POVERTY.

BY M. M. TRUMBULL.

Part II.

The effort of "organized labor" is to lower the wages of the many, and raise the wages of the few; to make an aristocracy of trades, and hold a monopoly of the knowledge that earns bread; to divide the working men into a high-wages caste and a low-wages caste, into skilled and unskilled laborers. Exclusion and proscription are employed to increase the numbers of the lower caste, and reduce the numbers of the higher. Despotism guard the guilds from intrusion, and crowd the ranks of the unskilled who must work for a dollar

a day. "It seems hard," say the "knights," "to forbid an honest boy to learn a trade, but we must protect ourselves, and in order to do that we must crowd him down to swell the dollar a day majority. It would be dangerous to let him learn a trade." This proscription is barbarous. The Guilds, and the Unions, and the Knighthoods, have no more right to keep a boy ignorant of handicraft than of arithmetic. They have no more right to cripple his usefulness by excluding him from the art and practice of bricklaying or printing, than they have to break his arm. His power of competition may be destroyed by either process, and one way is no more cruel than the other. To make unskilled labor skillful is the true policy, so that the product of labor may be greater, and its reward higher in money. By this plan we abolish poverty, by the other we create it.

The strategy and tactics employed by the aristocracy of labor against its poorer brethren, by the high-wage caste against the low-wage caste, may be seen in the following examples taken promiscuously from the papers:

"BIRMINGHAM, Conn., Jan. 4.—There is an extensive strike on the verge of culmination among the cutlery grinders of New England. They are mostly Englishmen, and control that part of the cutlery business, admitting *only their sons or near relatives* to learn the business."

"PITTSBURG, July 6.—The 4th annual meeting of the National Window Glass Workers' Association began here to day. * * * * Another feature of the agreement for next year will be the introduction of a new clause relative to the apprentice system. Employers claim that *at least a few apprentices* should be allowed to each factory."

"At the Pittsburg Convention July 7, 1886, a western delegate proposed to allow a limited number of apprentices to be indentured in the trade, the chief merit of the plan being that *only relatives be allowed to become apprentices*. The subject was put over until the results of the missions of Messrs. Wallace, Campbell and Winters could be ascertained."

Here we have a scheme not only to make an aristocracy of trades, but also to make that aristocracy hereditary, like the nobility of England. The vexatious leak in the plan was the drain to this country of glass-blowers from Europe. To stop that leak Messrs. Wallace, Campbell and Winters were sent to England and Germany. Their mission was to induce the glass-workers there to put glass-blowing among the occult sciences, and allow no apprentices to learn it.

"PHILA., July 14.—The 400 rug weavers, who have been on strike at the rug and carpet manufactory of John Bromley & Sons, returned to work yesterday under protest. The cause of the strike was the refusal of the firm *to lay off a learner*."

Pitiful and mean as that action of the carpet-weavers was, it found imitation in the conduct of a still more

inferior aristocracy, the nobility of carpet-layers. Here is an extract from a Chicago newspaper:

"A meeting of carpet-layers was held yesterday to form a Carpet-layers Union. There are from 75 to 80 skilled carpet-layers in the city, and the object of the proposed union is to keep up the price of skilled labor, and *keep unskilled men out of the business.*"

It seems difficult to form an order of nobility out of people whose only claim to it is that they sew hams up in bags, and yet it can be done. Here is an item from a newspaper dated June 28, 1886:

"Last night the Ham-sewers of Chicago entered the Knights of Labor. The industry can only be followed seven months in the year, and the average earnings are \$3.00 per day. About one year's apprenticeship is required before one becomes an expert in bagging hams neatly. As the industry is a growing one, measures are being taken *to keep novices out.*"

Where the statutes and decrees of this new chivalry are not sufficient of themselves to crowd willing industrious men out of work, and into poverty, the city and State governments are appealed to for assistance. An antiquated law, a relic of English class privilege, protects the lawyer trade against the competition of natural genius, by requiring all aspirants to that profession to spend so many years in a lawyer's office, or to obtain a diploma from some law school, or at least to pass an examination. If the State may arm the lawyer with this absurd proscription to protect him from the rivalry of brighter men, why should not the same weapon be given to the carpenter and the blacksmith, to the newsboy, the car driver and the architect? Last winter the car drivers of New York asked the Board of Aldermen to proscribe a certain class of intruders into their profession. As the car drivers cast a good many votes their demand was complied with, and "an ordinance was passed requiring every driver of a car to *obtain a license*, and requiring that every one receiving a license shall be 21 years of age, a resident of the state one year, and of the city four months."

Some time ago the newsboys of Chicago demanded a similar proscription for their benefit, but as they had no votes their claim was not allowed. They also demanded that all newsboys pay a tax of \$5 a year. The effect of this would be to "freeze out" all the boys who were not able to pay the \$5 and make the rest an aristocracy like the lawyers. The boys who considered themselves able to pay the tax, marched in long procession to the offices of the newspapers which opposed the scheme, and poured upon them derision and contempt in the howling classics peculiar to newsboys. They actually demanded that they themselves be taxed, because the effect of the tax would be to drive their poorer comrades away from the opportunity to earn a few coppers by selling newspapers on the street. Here was instinctive selfishness imitating the poverty-making tactics of the various "brotherhoods" of labor, and the

consolidated "brotherhoods" of capital. Is the ragged nobility of those ignorant boys any more ignominious than the broadcloth nobility of the high-caste brahmins of the other professions and trades? At the architects convention held in St. Louis November 17, 1875, it was recommended "that all State legislatures be petitioned to pass laws providing that examining boards be appointed by the governors, *the issuing of diplomas to architects*, and the fixing of penalties for practising without complying with the requirements of the law." The constant pressure of a thousand agencies like these against the weaker members of society must crowd thousands out of employment and out of the world.

Improvidence, and the many personal vices that make poverty, belong to another branch of economics, and are not considered here. Only the public vices born of the social war are here exposed, and very few of them. They will suggest others, and show the poverty-making character of this bitter struggle against each other, against plenty, against the skill that makes abundance, against equal opportunities, against freedom for all our energies. All this poverty-making is within the reach of public remedies, and in the application of those remedies lies the solution of the labor problem, the restoration of peace.

"Scientific and pseudo-Scientific Realism" is the subject of an article from the pen of Professor Huxley, in the current number of *The Nineteenth Century*. In answer to the assumption of Cannon Liddon, that science denies the possibility of miracles, on the ground that they are violations of natural law, he replies that true science makes no such denial, as it does not claim to have apprehended the whole region of natural law. A law of nature, in the scientific sense, is the product of an operation of the mind upon the data of nature that come within the limit of its observation. It would therefore be irrational to say that a catastrophe of any kind was miraculous, simply because we could not perceive the cause. Science looks upon apparently inexplicable phenomena as having natural causes, not as yet apprehended, and withholds assent to miracles solely on the ground that there is an insufficiency of evidence.

Up out of the thick of intellectual gloom that shrouded it in the beginning, the aspiring soul of man has risen. What strivings, antagonisms, what heights gained at the expense of millions of lives have the years witnessed. What a distance from the beast to man. Perhaps some human heart, dwelling amid the awful strife, was touched with the light of future day, and gained a momentary glimpse of the beyond. Perhaps that soul knew that one day love should be the law, that when the light of truth should have broken through error and illumined its depths, the disenfranchised souls of men would rise responsive to its beauty.

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixon Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of THE OPEN COURT is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to THE OPEN COURT should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, MARCH 31, 1887.

RIGHT THINKING.

Deeds are followed by consequences which can be observed at once and by everybody. The results of belief are less direct and cannot always be traced to their source. A man's acts appeal to the senses, while his beliefs with which his conduct may be glaringly inconsistent, manifest themselves in ways so numerous, subtle and imperceptible, and frequently blossom forth and ripen in the fruit of action at periods and places so remote from those at which they were expressed, that the connection between the beliefs and their legitimate effects generally escapes ordinary observation. Hence the popular notion that theoretical beliefs are of but little if any significance as factors in human progress, and that a man's influence should be judged chiefly by his character as manifested in his conduct. But a belief adopted by one whose conduct is scarcely affected by it because determined by inherited tendencies, early impressions, or social environments, may through his influence, be adopted by

those into whose lives, long after he is dead, it shall become incorporated as an active force in the formation of character and the determination of conduct.

A thought, a theory, a discovery or an invention, whatever be the moral character of the individual who first announces it, may profoundly influence the conduct and modify the conditions of millions through uncounted generations. A political or social theory originating in the mind of one who is not only regardless of the conventional standards, but even the just and reasonable requirements of morality, may prove a great benefaction to the race. Equally true it is that a false theory advocated by a sincere and enthusiastic philanthropist, and recommended by his own purity of life and nobility of character, may in time poison a community, producing possibly a moral cancer which only the surgery of revolution and war can cut out of the social system, still leaving perhaps the taint of disease to be combated and overcome in the on-going years. Error incorporated into individual or social character makes harmonious development impossible; and the more deeply it is implanted and the more numerous and firmly established are the false adjustments to which the character is forced in accommodation to the disease, the greater the suffering to be endured before the permanent conditions of healthy growth can be reached.

Clear thinking, then, is quite as important as correct living; and the man who helps to make others think aright thereby helps to advance not only intellectual but moral progress, and to augment the sum of human happiness. He, on the contrary, however unexceptionable his conduct and pure his motives, who helps to befog, mystify and confuse the minds of men by sophistry and error, is as much the enemy of moral as of intellectual advancement. Slovenliness in thought is certain in time to result in slovenliness in morals. Thought cannot be divorced from conduct, even though the thought, true or erroneous, of one generation shows itself the most conspicuously in the conduct of succeeding generations. A teacher of error may be sincere, but his sincerity in no way severs the connection between cause and effect, and therefore in no way diminishes the results of the error. Indeed, intellectual error is harmful in proportion to the sincerity of its adherents, upon which its growth depends.

The poison lurking in many theories is the more effectually hidden, like the serpent in a bed of roses, by the drapery of language and a false sentimentality which, while they charm, often conceal the implications and absurdities of a belief; but time, the unimpassioned ally of truth, strips such theories of all that deceived and deluded men, and shows their real results in the moral rotteness as well as the intellectual deformity to which they lead.

It is evident that he who, in laying stress on conduct

attaches but little if any importance to theory or belief, and computes men's influence wholly or mainly from the acts by which they project themselves out upon the field of active labor, ignoring or assigning to a secondary place the influence of thinkers and teachers, takes a view of life that is narrow and narrowing in its tendency. The importance of right conduct and the value of direct moral teaching, both by precept and example, and of moral agencies and influence of every kind are admitted by all. There is not so general an appreciation of the work of those who stimulate thought, increase knowledge, and in science and philosophy, as well as in poetry and song, help to educate the race in the principles of truth and virtue.

In a late number of the *Fortnightly Review* Professor Huxley has a reply to W. S. Lilly, who in a few pages attempts to show the utter infeasibility of finding any satisfactory scientific basis for morals, and distinctly hints that the only safety for the race lies within the bosom of the Roman Catholic Church. In Professor Huxley's article entitled "Science and Morals: A Reply," an exactly opposite view is taken. Science is attempting the work that the Church has neglected, *i. e.*, to find an indestructible basis for the rules of right conduct. It neither denies nor asserts the existence of a God, but insists upon morality as independent of either of these considerations, and so far from tending to bestialize man, is rather striving to give him a rational conception of the law of his existence. Morality is indestructible, and if the clothing of creeds which it has so long worn has been found to hide its true character, there is no reason to set up the hue and cry of danger when these obstructions are laid aside. Science hears the grumbling of the Church; she hears the accusation of "Materialism," but keeps faithfully at her work of drudgery. She sees order where there is seeming disorder. The evolutionary process is clear before her eyes, and she knows that the safety of morality lies in abandoning the unfounded assumptions of theology and holding to a belief in the order of Nature, which follows immorality with social chaos as surely as it follows physical trespasses with physical disease.

* * *

In "Science In Religious Education," published in the January and February numbers of the *Popular Science Monthly*, Daniel G. Thompson pleads for the abandonment of religious teaching (other than scientific) in universities and schools generally. The wide differences in religious belief that are so evident will sooner or later make this demand imperative. The present system of education in our universities is one calculated to instill into young minds religious prejudices that cannot fail to be detrimental to their highest interests, scientific criticism of theological dogmas being out-

lawed. A religious organization has a perfect right to establish an institution where its belief or creed may be taught. Those who go there will be drawn because of their sympathy with such creed or teaching. But public schools and state universities are no longer public or for the people when a religion is there insisted upon that lacks the sanction of the general mind. In justice to all, the principal religious beliefs should be studied in our universities in the light of science, all the evidence for and against them being presented, that conclusions may be drawn by individual minds unhampered by any theological assumptions. Truth alone should be the basis of teaching, and what is not truth or unverifiable statements, should not be asserted where veracity is regarded.

* * *

As of old the West still looks to the East for religious light, and accordingly "B. D.," of Chicago, thus inquires of the Boston *Investigator*: "Do you consider Monism and Agnosticism to mean the same as our OPEN COURT says?" To this the editor replies: "No; one presumptuously affirms there is a God, the other modestly asserts that it does not know. If this statement is correct there is no agreement between them, though it may be that we don't exactly understand what Monism is." Another question asked is: "Can you tell me what a Free Religionist is—whether Christian or Infidel—as I am having a controversy on the subject?" Our venerable contemporary of the East answers as follows: "A Free Religionist is probably an Infidel under a Christian name, because an Infidel is one who rejects the Divine authenticity of the Bible, and as a Free Religionist does that, he is an Infidel really, though nominally a Christian. He is not indorsed as a believer by church people, but he is 'on his winding way' towards the acknowledgment of more independence,—when the popular and fashionable hour shall arrive." These definitions are given here because THE OPEN COURT has no "funny column" in which they can be copied.

* * *

There is great dissatisfaction among the National Liberals, and not a little among many of the Conservatives over Bismarck's concessions to the Vatican, which are looked upon as a reaction likely to strengthen the Papal power not only in Germany but elsewhere. Says the *Vossische Zeitung*: "Not only is the Roman church the undisputed victor in the contest, but Germany's leading statesman has even appealed to the papacy for help to overcome the opposition, which, after all, is composed of men who, though his political enemies, are his own countrymen." The government papers bestow liberal praise on Bismarck's action as effective statesmanship, but the concessions seem generally to be regarded as of the purely opportunist character, and to afford small grounds for belief that the peace compact with the church will long be maintained.

A number of American and German naturalists, including Haeckel, are now striving to show what good service the daring Frenchman, Lamarck, did, in expounding an important law of nature which has not been adequately recognized, even by evolutionists. One of these neo-Lamarckians, Prof. Hyatt, recently read a paper on "Effort in Evolution," before a club where Darwin's views had never been brought without exciting eager opposition. The lecturer, while plainly rejecting the fancy of special supernatural creation, and cordially acknowledging the correctness of the principle of natural selection, said that Darwin had simply built on Lamarck's foundation; and that no admiration of the superstructure should prevent our keeping in mind the value of the great truth on which it is based. Many facts show that the structure of animals is largely due to their attempts at conformity with changed conditions of environment. Among the minute inhabitants of ponds of fresh water are some which are found in a greatly different form in brackish pools; while a third species occurs where the water is intensely salt. The breaking down of a dam at salt-works has been found to bring about a transformation of species in one direction; as repairing the dam did in the other. The naturalist who observed this has since tried the experiment in his own aquarium, where the same animals were actually made members, first of one species, then of another species, and then of a third, and finally carried back into their original form, simply by increasing or diminishing the amount of salt. Then again, one of the lobster's claws has sharp teeth and the other blunt ones, and there is always a corresponding difference in size; but Prof. Hyatt found on examination of five hundred lobsters that the right claw was the large one with one-half of them, and the left claw with the other, showing that not only the size of the claw but the shape of the teeth is due to the peculiar habits of the individual possessor. One lobster uses his right claw as another does his left claw, and both claws and teeth take form accordingly. That the dog's wild relations hunt in packs, while the cats hunt singly, seems due to a greater amount of natural sociability in one family than the other. Elephants, too, though not needing to associate for mutual advantage, do so for mutual pleasure. Monkeys so far overleap the law of "survival of the fittest," (as interpreted by some persons) as to pick out thorns from disabled comrades, and otherwise preserve the wounded and enfeebled. Thus, there is constant effort, not only to meet changes in environment, but to carry out peculiarities of habit and temper. This power of individual effort has had much more to do in shaping the original structure of each species than natural selection, which seldom comes into play for any species until it has had time to make its members numerous enough to crowd one another. And, as men have made

themselves what they are by their effort to work out their ruling traits of character, so we may hope, that as these traits improve from generation to generation, the whole structure of society will be reformed accordingly. Such, at least, we understand to be substantially the views of Prof. Hyatt, and many share them with him. Emerson is known to have studied Lamarck with great interest, and to have followed this theory of evolution in the lines:

"And striving to be man the worm,
Mounts through all the spires of form."

* * *

The bequest of the late Lord Gifford to the four universities of Scotland for the support of free independent lectures on National Theology by prominent thinkers "of," to quote from the will, "any denomination whatever, or of no denomination at all," "of any religion or way of thinking, or, as is sometimes said, they may be of no religion, or they may be so-called skeptics or agnostics or free-thinkers," provided only that they be "reverent men, true thinkers, sincere lovers of and earnest inquirers after the truth," is of interest to all lovers of the Science of Comparative Religions and to all friends of independent thought. The *Scotsman* says: "This will be the first step in a great revolution. Theological tests will linger yet for a time amongst us. But Lord Gifford has driven the first nail into their coffin. To all men they will soon appear as grinning anatomies, and before very long there will be a general cry to have them buried out of sight."

* * *

In an article entitled "Artisan Atheism," in the February number of the *Nineteenth Century*, William Rosseter discusses the alienation of the English laboring classes from the Church. The teaching of an antiquated theology that has no answer for the great social questions of the day, and that in some particulars is in direct opposition to the known truth, this, taken along with the fact of a comfortable and satisfied clergy that has no sympathy with him and his low condition, is what is drawing the English artisan farther and farther away from the fold of the dominant faith.

* * *

The Congregationalist has never had the least sympathy with Henry Ward Beecher's liberal theological views, but of the man and his work it now generously observes:

Probably no one face of this generation has been more universally recognized than his; and no one voice has ever thrilled a larger multitude with its humor, its pathos, and its trumpet calls to action. As preacher, lecturer, editor, author, he filled a large space in the popular thought. As a theologian, he had an influence larger than he really earned; and no one man probably has done more than he to bring the churches to a condition of departure from the old standards, which, in some respects, with multitudes of others, we have so deeply deplored.

A late writer has urged the union of the Catholic and Protestant Churches, on the ground that they would thus be able to cope more successfully with their common enemy, science. It is not to be wondered at that a feeling of insecurity should lead them to take some measures for the preservation of that which they hold in common, but a union of religious bodies whose tenets are, in some respects, antagonistic, would be a paradox unparalleled in history. It is inexplicable except upon the hypothesis of friendship springing up between implacable enemies, when a third power greater than either is gradually forcing them to the wall. In this case, all sincerity is forgotten in the common motive of self-preservation. This is what this writer asks for.

* * *

Rev. Canon Fremantle, an English Churchman, writes on "Theology Under its Changed Conditions," in *The Fortnightly Review* for March. The purification of theology has left but very little of the original structure. The doctrine of "The Fall of Man" has been given up, as a result of the teaching of the philosophy of evolution. The superiority of Christianity is admitted to have come in a great measure from the people who professed it. Finally the inscrutableness of Deity is admitted, and with it, as a matter of course, all teaching claimed as inspired will stand or fall, as it agrees with or antagonizes the facts of life.

* * *

A conception of the universe is formed by philosophy, out of the data furnished by observation and experience. This conception the religious sentiment proceeds to color and idealise, and while seeking in it the symbol of the infinite we also project into it a human element, which returns to us an echo of our questionings and yearnings. An apparent conflict arises between free thought and the religious sentiment, as soon as any conception of the cosmos fails to agree with the demands of science. The hostility in this case is between two scientific conceptions, the elder of which, having become outworn by the advance of knowledge, is still retained by religion. Its elimination is but a question of time. Experience teaches that after a greater or less period of searching for a new basis, the religious sentiment always frees itself from the old forms, and formulates a conception of the universe more in keeping with the developments of science and the needs of the existing social order.

* * *

A correspondent in Mexico City, writing of the many feast days observed by the native Mexicans, says: "There was a national celebration on the 16th of September. I think it was to celebrate the date when Mexico first became a Republic. Hidalgo was the hero of that day and his picture flourished in all the windows of stores and private houses. There

was a great military procession, with cars representing the different industries of Mexico; the military school, also one representing the Aztec temples, and accompanied by men in Indian costume. In the morning the President and government officials in citizen's dress walked down from the Plaza to the Alameda through the principal streets. The day after the Feast of All Saints (which of course was a church celebration) was the day of the dead. I don't know whether it was to remind people of their mortality or not, but in a way they seemed to take a cheerful view of it. There were booths for the sale of toys and confectionery all round the Plaza, and the toys were little hearses, and dolls in mourning dresses, and dancing-skeletons; and the confectionery shops had sugar skulls and thigh bones conspicuously displayed for sale. The effect was, on the whole, not as ghastly as might have been expected."

* * *

From an article on "How Should Labor Organize?" in the editorial columns of the *Catholic Review*, in which often appears sound and wise advice to working-men, we quote with approval the following extract:

It is one of the absurdities of American human nature to fancy that every conceivable social benefit is conferred by a politician, a legislature, and a law, when in fact the very best influences for good and against evil in the State are those which stand outside the political garden. The religious organizations of this country are an example. Without having anything special to do with politics, yet a declaration from them is a thing to be respected and feared. The pernicious influence of the monied corporations is well known. The influence of honorable men, whose names stand with thousands as synonyms of virtue and truth, is very powerful in this nation. Do not these facts point the way for the feet of labor advocates and leaders? Instead of walking the long, thorny, uncertain road of politics, would it not be better to organize outside with a view to influence the present political parties, to influence the public opinion of the country and create a sentiment in favor of just treatment?

* * *

Says John Morley in an article on "Byron:"

The greatest poets reflect, beside all else, the broad-bosomed haven of a perfect and positive faith in which mankind has for some space found shelter, unsuspecting of the new and distant wayfarings that are ever in store. To this band of sacred bards few are called, while perhaps not more than four high names would fill the list of the chosen; Dante, the poet of Catholicisms; Shakespeare, of Feudalism; Milton, of Protestantism; Goethe of that new faith which is as yet without any universally recognized label, but whose heaven is an ever closer harmony between the consciousness of man and all the natural forces of the universe; whose liturgy is culture, and whose deity is a certain high composure of the human heart.

The mind of the scholar, if you would have it large and liberal, should come in contact with other minds. It is better that his armor should be somewhat bruised by rude encounters even, than hang forever rusting on the wall. — *Longfellow*.

DR. EDMUND MONTGOMERY.*

Dr. Edmund Montgomery was born in Edinburgh, in 1835. His parents were Scotch. His father was a prominent lawyer. When but four years old he was taken to Paris where he remained till he was nine. The remainder of his youth was passed at Frankfort, Germany. Of the circumstances of his early life we know but little beyond the fact that his attention was directed early to natural science and philosophy. When he lived in Frankfort, in 1850, he was deeply interested in Schopenhauer, whom he saw pass daily with his poodle, and whom he regarded as a philosopher when most people who saw the great pessimist regarded him as a mad man. At the age of fourteen he had been ostracized for refusing to be confirmed, after having passed through the usual religious instruction. The matter became a public scandal. Clergymen vied with one another to convert him. From being the most popular boy he found himself soon isolated, and the circumstance saddened him profoundly for many years. Some years later he became acquainted with Feuerbach and attended at Heidelberg the lectures of Moleschott and of Kuno Fischer and discussed matters with them. He had frequent intercourse with prominent philosophers who had been pupils of Schelling, Fichte and Hegel, especially with Hofrath Kapp. At Bonn he attended Helmholtz's lectures on the Physiology of the Senses, and began to formulate psychophysical problems,—problems that now go under the name of "physiological psychology." He studied at German universities from 1852 to 1858—Heidelberg, Berlin, Bonn, Würzburg (where he became M. D.) Prague and Vienna. He had gone through Comte's suggestive and original, even though tedious works, in French before he went to England, where he studied Mill and Bain and other representatives of the association philosophy. He had studied Darwin and arrived at his main philosophical conclusions before he read anything of Herbert Spencer's.

All philosophical systems appeared to him merely reflex-thoughts from the conception of organic life prevalent at the time being, and he was deeply impressed with the need of a Philosophy of Organization. But first of all, Kant, the most powerful introspective philosopher, had to be encountered. In his student days he had gone through the *Critique of Pure Reason* at least five times, and the whole thing was alive before his eyes. The result was a book whose title may be translated thus: *Kant's Theory of Knowledge Refuted from the Empirical Standpoint*. In the original German it is, *Die Kantische Erkenntnislehre widerlegt vom Standpunkte der Empirie*, Munich, 1871.

It is, as the sub-title says, "a preliminary contribution

towards the establishment of a physiological conception of nature." In the preface the author advises conservative and reactionary thinkers to take a lesson from China and keep all the avenues of learning open to students. He urges the study of nature and of things themselves, instead of trying to reach truth by accepting as true whatever can be tortured consistently out of established ideas, according to the formal logic in German philosophy before Kant. One section of the work contains a summary of the *Critique* which Dr. Sterling one of the best authorities in English, in his reply to Dr. Montgomery published in the *Fortnightly Review* for October, 1872, p. 413, admits to be accurate and praiseworthy. Dr. Montgomery's reply to the assumption on which the *Critique* is built, viz., that our ideas of Time and Space are given us from within as *a priori* conditions of experience, without whose direction knowledge would be impossible, Sterling calls the germ of our author's thought.

Dr. Montgomery says: "There needs only the refutation of this one fundamental position, and the whole laborious fabric sinks helplessly together." "Time and Space, as infinities, are only abstractions, and are never given us *a priori*. Under every true perception of space and time lies a portion of that empirical raw material of knowledge, consisting in feelings called into consciousness by muscular action." Kant was not enough of a physiologist to see how closely our mental activity, which enables us to know Time and Space, is connected with our muscular activity, that enables us to become conscious of motion against and among external objects; and to verify those generalizations, from observation and experience, which we become entitled by such empirical verification to accept as the fundamental axioms of mathematics. Transcendentalism has made mathematics her stronghold; and Kant admitted her claim; but Dr. Montgomery maintains that mathematical knowledge really comes, like all other knowledge, from without. His arguments are unusually clear, as are those adduced to show that the necessity, which compels us to combine a variety of impressions of color, resistance, temperature, etc., into a perception of some external object does not lie in the structure of our minds, as Kant thought, but in that of the object itself. No wonder that Haeckel writes to Dr. Montgomery that his excellent book is now often quoted in controversy.†

† Dr. Montgomery's views of Kant may also be found in these essays: "The Dependence of Quality on Specific Energies," (*Mind*, No. XVII, 1880). "The Substantiality of Life" (*Mind*, No. XXIII, July, 1881). "Causation and its Organic Conditions" (*Mind*, No.'s XXVI, XXVII and XXVIII, 1882). "The Object of Knowledge" (*Mind*, No. XXXV, 1884). "Space and Touch" (*Mind*, No.'s XXXVIII, XXXIX and XL, 1885). "Transcendentalism and Evolution" (*The Index*, March 26 and April 2, 1885). "Scientific Theism" (*The Index*, March 11 and 18, 1886). "Plato and Vital Organization," read before the Concord School of Philosophy, July 26, 1886, (*The Index*, August

*This account has been prepared partly from publications of Dr. Montgomery, and partly from data supplied by unpublished letters written by Dr. Montgomery to B. F. Underwood from 1883 to 1887.

Before publishing this book he had begun a series of scientific experiments which we cannot here describe at length or pass final judgment on. He has for years been striving to overthrow the cell-theory, still generally held by men of science, one of the most eminent of whom has described himself as "a cell-aggregate brought into harmonious action by a co-ordinative machinery."

"What can all philosophical speculation avail," says Dr. Montgomery, "without an understanding of vitality and organization? If molecules or cells really build up complex organisms, then there is no escape from the assumption of a supernatural spirit, governing vital formation and activity. I, for one, could find no peace 'till this question was positively settled one way or the other." From 1860 to 1863 he had a laboratory at St. Thomas's Hospital, where he examined all the material afforded by the institution, which is one of the largest in London. Employing new methods, he soon found out that the secret of life is not contained in a set of mysterious properties shut up in so-called cells. To render this evident, not only through observation of natural cell-forms, but also through experimental demonstration, he prepared a substance with which he succeeded in artificially imitating almost every cell-form. He had just been elected Lecturer on Physiology by the faculty, when the effects of a dissecting wound put an end to his London career, and for many years also, to his scientific work. Lung trouble obliged him to pass the winter in the south, and eye trouble prevented him from working with the microscope. Not before the end of 1866 was he able to present the results of his previous work to the Royal Society. Lionel Beale, a pietist and theological partisan, happened then to be the

12 and 19, 1886), and "The Previous Question Underlying 'Scientific Theism' versus Naturalism" (*The Index*, October 14, 1886). In the essay on "Space and Touch," he remarks that his book "vaguely ascribed to muscular sensations what I now know to be accomplished by directly felt positions not dependent on sensations of movement." The essays on "Causation," "The Object of Knowledge" and "Substantiality," object particularly to Kant's failure to acknowledge the full influence over thought of the external world. The same objection is urged in *The Index*, for April 2, 1885, March 18, 1886 and August 12, 1886.

What Dr. Montgomery says of Kantism in *The Index* is little more, however, than a prelude to his attacks on much more popular systems of transcendental philosophy, which he compares with his own view thus: "The question is, what underlies the wide-spread display and endless train of conscious occurrences that, for each of us, make up the world we know? And what is the real meaning of it all? Genuine transcendentalism answers: The absence of our being consists in a spiritual organization or subject, autonomously weaving steady experience out of the ever-changing conscious phenomena; and it all means the more or less adequate understanding of that which eternally and unalterably subsists in a universal consciousness. Genuine naturalism answers: The true subject and bearer of the conscious display is that abiding something of ours which we perceive as our living organization, and its conscious affections signify to us the recognition of our own relations to the entire economy of sense-compelling influences which we call the world."

"We have ambiguously to decide for one or the other of these extreme views. Consistent thinking can discover no compromise. Our being is either wholly natural or wholly spiritual." "In

Royal Society's authority on such subjects. He opposed Dr. Montgomery's chemical views and succeeded in preventing their publication in the transactions. Richard Owen wrote at the time a spontaneous and appreciative letter, saying that if he had been there this would not have happened. Next year he published the paper at his own expense. It forms a handsomely printed volume of sixty pages: *On the Formation of So-Called Cells in Animal Bodies*; by Edmund Montgomery, M.D.; London, John Churchill & Sons, New Burlington street, 1867. Its accounts of the natural and artificial production of cells are so clear and satisfactory that Owen cites it as an "important contribution to the philosophy of physiology" (*Anatomy of Vertebrates*, volume 3, page 564). According to Dr. Montgomery, we cannot admit that "the units of which organisms are composed owe their origin to some mysterious act of that mysterious entity, life, by which in addition to their material properties, they become endowed with those peculiar metaphysical powers constituting vitality." On the other hand "the organic units, like those of inorganic bodies—the crystals—form, by dint of similar inherent qualities," and assume "necessary modes of appearance as soon as certain chemical compounds are placed under certain physical conditions." "If the former view be true, then we must clearly understand that there exists naturally a break in the sequence of evolution, a chasm between the organic and inorganic world never to be bridged over. If, on the contrary, the latter view be correct then it strongly argues for a continuity of development, a gradual chemical elaboration which ultimately results in those high compounds, which, under surrounding influences, manifest those complex changes called vital."

no way can our veritable being be both together; a spiritual subject, constituting experience by dint of its own power, and also an organic subject, experiencing its naturally constituted functions. Experience is either exclusively organic or exclusively hyper-organic." (*Mind*, 1884, p. 1).

In another published essay, he says: "The two great cosmological conceptions which are now struggling against each other for supremacy, involve inevitably as ultimate result the decision: Whether life be indeed a deplorable aberration from the original fullness of thought-steeped being; or whether it be rather a desirable unfolding of more and more intense and ample world-consciousness." "Either the human body in its progressive organization has to be cherished as the only true temple and revealing oracle in the universe, or complete extrication from every bodily impediment must become the chief aim of human exertion." "Consistent rationalistic transcendentalism is of necessity hostile to the fulfilments of nature, to the aims of vital being. Its ethics do not consistently yield rules of action, but rules of restraint from action, leading like all supernatural codes to unmitigated acenticism." "The object of its striving must ever be diametrically opposed to that of natural evolution. Evolution points to a life-affirming, life-exalting faith. Transcendentalism involves total life-negation." "Shall we then, for any visionary banking after individual bliss forsake the wide-spread vital mission ingrained in every fibre of our mystic frame? Shall we, as called upon by transcendentalism for the dream of an incommensurable self-beatitude or spiritual quiescence, desert the creative task allotted to us by whatever is underlying nature and its unaccountable growth, the task here among our fellow-beings under joy and anguish to work out the higher life of that all-comprising organization of which we are veritable personations?"

At the time Dr. Montgomery published this little book he had a laboratory at the Zoölogical Gardens during the summer months, where he met and conversed often with Darwin, and deferentially entered into the thought of the great naturalist who was just then working out his hypothesis of Pangenesis on the basis of the cell theory, and who was naturally not open to Dr. Montgomery's special views. There were plenty of other problems to talk about and on these, views were freely exchanged.

In various quarters, Dr. Montgomery's conclusions adopted, and extravagant theories of life were erected on the strength of them. They influenced Dr. Bastian's *Beginnings of Life*. Dr. Montgomery, however, never believed either in a molecular theory of vitality or in spontaneous generation of any of the forms of life now known.

After leaving the hospital he practiced for six years at Madeira, Mentone and Rome; but in 1869 he retired with a moderate competence, to devote himself to science and philosophy, which had been his purpose from the beginning. He had meanwhile become more convinced than ever that the philosophical problems which had so intensely perplexed him could be solved only through an understanding of vitality and organization. Life! what is life? He could find no peace till this question was positively settled one way or the other. Accordingly he came in 1871, after publishing his protest against Kant's authority, to Texas, where he has resided ever since on his estate, Liendo plantation, Hempstead. He says that: "The first seven years here in the South were devoted to laborious biological researches. No writing at all." His principal objects of observation have been minute animals of the simplest structure, barely distinguishable from plants, mere shapeless lumps, without visible head, limb, eye, or mouth, and variously known as monera, protozoa and amœbæ, the last name denoting their capacity of changing form indefinitely, by alternate expansion and contraction in one or more directions.

This capacity of motion or motility, has been made a special study by Dr. Montgomery and with very important results. "Spontaneous motility," he says, "constitutes the most salient and characteristic feature of animal vitality. Its scientific explanation had thus become the chief desideratum of physiology. When amœboid forms of life were first carefully noticed, the attention of investigators was naturally arrested by the strange display of their amœboid movements. But, importing at once from muscular physiology the conception that vital motility is due to a specific property, called contractility, scientific curiosity was pacified by simply giving the name of contractile substance to the moving proplasm. The occult property, 'contractility' was here also allowed to pass as an explanation of vital

motility," (Webster's *Dictionary*, for instance, defines "motility" as "the faculty of moving contractility.") "Thus matters stood when I began my protoplasmic studies." "Where masters have failed, surely I, their obscure disciple, would never venture to come forward with a view of my own. But it so happened that by some fortunate accident nature allowed herself, as I believe, to be caught in my presence without her usual impenetrable guise. I could not help seeing what others have so long sought for in vain. By some strange fascination, I was drawn into giving careful attention to the peculiar amœboid movements displayed by homogeneous protoplasm. Day and day (sometimes for eighteen consecutive hours), and month after month for five years (from 1872 to 1877) I kept close watch on those slow and monotonous movements. From near and far a vast array of specimens were gathered showing every imaginable variation of this one central activity, the pushing forward and retracting of projections." "I followed the sluggish current of hyaline" (or transparent) "material, issuing from globules of most primitive living substance. Persistently it forced its way." "Gradually, however, its energies became exhausted, 'till, at last, it stopped an immovable projection, stagnated to death-like rigidity. Thus, for hours perhaps, it remained stationary, one of many such rays of the many kinds of protoplasmic stars. By degrees, then, or sometimes quite suddenly, help would come to it from foreign but congruous sources. It could be seen to combine with outside complemental material drifted to it at random. Slowly it would thereby regain its vital mobility, shrinking at first. But gradually, completely restored and reincorporated into the onward tide of life, it was ready to take part again in the progressive flow of a new ray. On the other hand, I watched also the brisk current of more highly elaborated but still homogeneous protoplasm," etc. "So I continued watching and pondering till it all seemed clear to me, till these primitive displays of vital activity had disclosed—to the satisfaction of my own mind—the constitution and interdependence of the elementary properties of life."

The results concerning motility are stated as follows: "I first showed that the pushing forth of protoplasmic projections and not the subsequent contraction of the same, constitutes the fundamental act of vitality; that contraction is dependent on previous spontaneous and active expansion." Thus the existence of vital spontaneity or self-initiated movement, which had been denied by biologists and declared impossible by physicists in general, was proved by actual observation. "A certain organic substance expands under chemical composition and afterward contracts under chemical decomposition. Its disintegration is incited by the dynamical influences of the medium. Its integration is brought about by its own inherent chemical affinity." Thus, "the display of

living motion on the part of the protoplasm, which has hitherto been contemplated under the aspect of an occult vital property called 'contractility,' has been proved to consist in an alternate expansion and contraction of organic substance, accompanying its functional integration and disintegration." "The power exhibited during motility is in reality the chemical power of specific affinity interwoven into the living substance, and inducing during its saturation expansion of the same." He also demonstrates how all essential organic divisions of the animal form,—its oral and aboral pole, its bilateral shape, its sensory surface, its integument, its contractile layer, its food-receptacle, its depurative organ,—how all these organic divisions necessarily result from the specific and unitary cycle of chemical activities which constitute the life of the living substance. These researches are described at length in the *St. Thomas's Hospital Report* for 1879, and more briefly, in *The Index* for December 25, 1884, as well as in the articles on "Monera and the Problem of Life," in *The Popular Science Monthly* for September and October, 1878.

To the five years thus spent he added two more on the Infusoria, and so produced a paper which appeared in the *Zenaische Zeitschrift für Naturwissenschaft*, volume xviii, and also in a separate pamphlet, under the title of *Ueber das Protoplasma einiger Elementarorganismen*. There he shows how the organization of Infusoria with all its peculiarities can be explained as a higher development of the different phases of the unitary cycle of vital activities which constitutes protoplasm, or the living substance. The paper has never been translated, but its most interesting portion, the attack on Darwin's theory of Pangenesis, may be found briefly summarized in a series of articles in *Mind* for 1880, which have been reprinted as pamphlets on "The Unity of the Organic Individual." Here may also be found his criticisms on the Polarigenesis of Herbert Spencer and the Perigenesis of Haeckel. Dr. Montgomery holds, however, that "Life is not a consequence of organization; but, on the contrary, it is the formless protoplasm that builds up organized forms."

Two more years of hard work enabled him to publish, not only as an essay in Pflüger's *Archiv für die gesammte Physiologie*, volume xxv, but as a pamphlet (Bonn, Emil Strauss, 1881), his observations of muscular motion, entitled *Zur Lehre von der Muskel-contraction*. Some of its most striking passages may be translated thus: "As soon as we admit, with most of the recent physiologists, that the protoplasm of the muscles is not essentially different from that of the lowest forms of life, it can be fully proved that it is solely the muscular substance itself which produces all the power exerted in motion." "The spontaneous chemical integration of the living substance is the key to the secret of its nourishment, growth, multiplication, resistance to

destructive influences and capacity of persistent reaction against stimulating impulses. It is, in fact, the power of resistance displayed in all vital function, a power which not only opposes itself to all encroachment from outside, but which moreover repairs the damage caused by such encroachments,—is the fundamental peculiarity of life." "The living substance is not an aggregate of equal molecules held together by cohesion." "It is a chemical unit and not a physical aggregate." "All the phenomena of life rest at bottom on specific chemical processes." "The chemical process which underlies muscular activity is not one of oxydation, but one of disintegration and reintegration." "The power of expansion is inherent in the muscular substance; and not due to any combustion, or other result of external influences." "The living substance treasures up within itself, as internal wealth, the organic results of endless previous elaboration. Raised thus above the destructive ravages of time, an indivisible, specific totality, it gathers the life of the past into simultaneous presence, and confronts in ever rejuvenated wholeness the scattering and perishing things of this world. It is the living substance that is perennially persistent, not the dead configurations of unfeeling matter."

This paper is also interesting, as demonstrating that the muscles are not composed of cells, and thus enabling Dr. Montgomery to reply more emphatically than ever in the negative to the question he has recently taken to head a pamphlet: "Are we Cell-aggregates?" Here he expressed (in November, 1880) his hope that "we shall be delivered from having to consider ourselves a congregation of ever so many primitive lives, and shall feel scientifically restored to the full dignity of indivisible autonomous personalities." The reader who prefers to consider himself as a person, and not as a congregation, would do well to read carefully not only the pamphlet just quoted, but those on the "Unity of the Organic Individual." (*Mind*, Nos. xix and xx). And further evidence that we are not mere aggregates of cells acted upon from without by some higher power may be found in the arguments in the *Popular Science Monthly*, September, 1878, that "Nature does not consist of so many particles of inert matter held together or pushed about by a set of mysterious agents." "All vital efficacy resides in the living substance itself, and forms an integral part of its specific nature." "The power of our life is intrinsically wrought, not extrinsically derived." Dr. Montgomery says in an unpublished letter that "The recognition and clear demonstration of the unity of the organic individual constitutes the solid basis for all my thinking." He is receiving he informs us "spontaneous letters from prominent scientists expressing their adherence to my views, though with considerable caution as yet." Many eminent German botanists, have recently, as he says,

found out that "the entire protoplasm of a complete plant forms a continuous substance. What have formerly been taken for separate, closed cells turned out to be only partial partitions between different portions of the continuous protoplasm which is seen to flow in and out." The adoption of this view, and consequent recognition of each plant as a single, coherent entity by Professors Sachs and Klebs, is fully stated in the *Biologisches Centralblatt*, for Nov. 15, 1884. Prof. Kollman, too, of Basel, has adopted Dr. Montgomery's view of vital motility and gives him due credit in a paper on "Elementares Leben," which forms a part of the great German collection of scientific essays, edited by Virchow and Holtzendorf. Most German physiologists now ascribe the movement of muscles to their inherent chemical properties.

The theory of the convertibility of forces, however, involves the assertion that, as Mayer says: "The muscle is not itself the material by means of whose chemical metamorphosis the mechanical effect is produced," but "only a machine through whose instrumentality is brought about the transformation of force,"—namely of heat into muscular power. Dr. Montgomery has been accordingly forced to oppose a current scientific belief, which Spencer expresses thus: "The law of metamorphosis, which holds among the physical forces, holds equally between them and the mental forces. These modes of the unknowable which we call motion, heat, light, chemical affinity, etc., are alike transformable into each other and into those modes of the unknowable which we distinguish as sensation, emotion, thought, these in their turn being directly or indirectly retransformable into the original shapes." (*First Principles*, sec. 71). The inconsistency of the theory of the convertibility of forces with the fact of the stability of natural phenomena, has been urged by Dr. Montgomery, not only in the *Popular Science Monthly*, September and October, 1878, but also in a lecture published in *The Index* for August 27, 1885, previously read before the Concord School of Philosophy—"Is Pantheism the Legitimate Outcome of Modern Science?" † and more exhaustively in five articles, which appeared October, November and December of the same year in *The Index*, on "The Dual Aspect

of Our Nature." Here he protests against "such a riot of metamorphosis as is implied in the convertibility of every manifest mode of the unknown into every other mode of the same, which means, in fact, the convertibility of everything into everything else. Let no one think this is an exaggerated statement. The reasoning is simple enough. Every phenomenon in nature is the manifestation of one and the same force. Such force-manifestations are mutually convertible. Therefore, there is no phenomenon, material or mental, which is not convertible into any other phenomenon." He maintains that "conceiving mental phenomena as modes of an all-comprising unknowable," implies transcending the limits of organic individuality and falling into pantheistic idealism; that feeling and brain motion are not mutually convertible; that our present existence is "not in the least phenomenal," but a part of "the utmost reality of life;" that this reality is larger and much more permanent than consciousness; that "our mental presence constitutes in itself the symbolical though practically reliable representation of the very powers of nature by which it is produced;" that "mind is an organic product," and that "our veritable nature is a permanent non-mental entity, of which our mental phenomena are an ever renewed afflux."

In his address on "The Scientific Bases of Religious Intuition," written by special request for the last convention of the Free Religious Association, and printed in *the Index* of May 27, 1886, the Doctor says: "Our own being, from the very dawn of living existence, has been fashioned to the core, in ceaseless interaction with the powers that constitute the outer world. We ourselves are individually something, some one, only in relation to the world in which we are living. Very visibly, there is not a single part of our body, down to its minutest textures, that is not corresponding to some outside relation." "And our mind, in its widest sweep and its highest flight, has clearly no other normal function than the conscious realization of our relations to outside nature. Only—to us human beings—the relations to our own kind, those most intricate, highly elaborated and refined relations making up our social life and culture, have assumed pre-eminent importance in our mental existence. They are in the real medium, in which we humanly and morally live."

† DR. MONTGOMERY'S paper, read before the Concord School of Philosophy last summer was regarded by many as the ablest essay of the session. It was extravagantly praised by some and criticized by others. A writer in the *Congregationalist* wrote:

"An elaborate paper from Dr. Montgomery, on The Platonic Idea and Vital Organization, was in some points the most distinctive one of the year, an altogether new and fresh line of thought being opened up by it. The writer, though owning a name unfamiliar to the popular ear, is one of the ablest of living physiologists. He believes that the present aggregative theory of life is incorrect, and utterly at variance with any true theory of evolution, and has given years to exhaustive experiment in demonstrations of his theory. Unluckily, his English is so German, and German of the most complicated and bewildering nature, that the bristling undergrowth must be cleared away before one can fully realize the beauty and power of his presentation.

THE following lines appeared in the Boston *Record*:

OUT-PLATOING THE PLATONISTS.

A Texan has floored the Concord crowd,
Sing high! and sing ho! for the great southwest;
He sent 'em a paper to read aloud,
And 'twas done up in style by one of their best.
The Texan he loaded his biggest gun
With all the wise words he ever had seen,
And he fired at long range with death-grim fun,
And slew all the sages with his machine.
He muddled the muddlers with brain-cracking lore,
He went in so deep that his followers were drowned,
But he swam out himself to the telluric shore,
And crowed in his glee o'er the earthlings around.

ENVOY.

Oh Plato, dear Plato, come back from the past!
And we'll forgive all that you e'er did to vex us
If you'll only arrange for a colony vast
And whisk these philosophers all off to Texas.

CORRESPONDENCE.

FREE-THOUGHT EDUCATION.

To the Editors:

The very interesting articles in numbers one and two of *THE OPEN COURT*, by Messrs. Davidson's and Jappe, have awakened in me a desire to say a word on the subject, if you will be so kind as to grant me a small space in your splendid journal.

The subject is one which is nearest my heart and embodies the fondest hopes of my life. The ideas advanced in both articles are, on the whole, splendid. Yet I feel that the writers' conceptions are hardly broad enough and the great central idea underlying the subject has been overlooked. In the consideration of this subject free-thinkers should ask themselves what are the objects of a free-thought institution of learning. Mr. Jappe says Mr. Davidson "is mistaken if he believes that a free-thought college will do much good; it is not in the colleges that the mind is framed, as far as the feeling of fear and hope, of reverence and esteem, are concerned." Is, then, the highest object of a free-thought college to make free-thinkers of our boys and girls? If this were all, there would indeed be little gained. All our colleges are doing this in spite of the superstitious influence surrounding them.

What is it, above all other things, that is needed to secure the most rapid advance of the cause of free-thought? Is our greatest need an institution or organization, whether it be college or lyceum, that will send forth from its doors avowed and aggressive free-thinkers as the above statement would indicate? I answer no. The most imperative duty now resting upon us, is not so much to guard the youth of our land against the poisonous influence of superstition, as to enlist into the active service of free-thought the thousands of men and women already free from its taint. Do this, and there will be no need to warn the young and growing minds against the snares of orthodoxy. The comparative weakness of the cause of free-thought is not due to a weakness in the number of free-thinkers. Three-fourths of our people to-day are either avowed free-thinkers or silent rejecters of orthodoxy. The orthodox element of this country form a very small majority. And yet orthodoxy, the great stumbling block in the path of progress, permeates every vestige of our progressive civilization and holds the seat of highest honor, while free-thought, the embodiment of all that is progressive, crouches before the tyrant, a trembling slave. Think of the thousands of free thinkers who, while looking upon the Christian system as a mass of superstition, deem it policy to remain silent. What is the cause of this? Here is the key-note. Superstition wears the silken garb and jeweled signet of honor and respect, free-thought is covered with the slimy robe of approbrium and looked upon in contumely and scorn. Whence this state of affairs? You answer, the church is thoroughly organized, free-thought is unorganized. True, and in what lies the chief strength of this great organization, without which orthodoxy would not dare to face the all-searching criticism of the nineteenth century civilization? There can be but one answer. It is the vast system of colleges and universities that are dedicated to the cause of superstition. Give us a few good free-thought colleges and the cause of free-thought will command the respect of the world; and, indeed, this should be the profoundest of reasons for establishing them. This is a practical age. The world demands of every system the fruits of its workings. When asked what free-thought has done for mankind, we proudly turn, and truly too, and point to our magnificent educational system, but the church says, not so, this is the child of Christianity. And, by the way, when we think of the old adage, possession is nine points in law, we feel like dropping our claim.

Let us then build to the honor and glory of our cause a few imperishable monuments that will stand alike the ravages of time and the batteries of superstition. Let us establish a few free-thought colleges and universities. Then will free-thought become a title which all will be proud to wear. Justice will be meted out for the glorious work it has done, orthodoxy will lose its hold upon the world, our public schools will become purified and there will be no need for free-thought lyceums to make free-thinkers of our boys and girls. Until the name free-thinker is respected and honored by the mass of humanity equally with the name Christian, our lecturers, our press, our writers, our lyceums, our thousands of earnest workers in the army of free-thought, can avail but little. To accomplish this we must offer to the world something tangible, something to which we can point as the glory of free-thought, something to which orthodoxy can lay no claim. Pre-eminently this something is a free-thought institution of learning and this should be our chief object in establishing one.

M. D. LEAHY.

BOSTON CORRESPONDENCE.

To the Editors:

In these days of rapid transit, when places as distant from each other as Boston and Chicago are brought near together and communications between them are exchanged in a few hours, and their commingling influences tend to obliterate their local peculiarities and give to them common resemblances and affinities, it becomes less difficult to be reconciled to the removal of *The Index* to the more favorable soil of the West, than it would be if these considerations were wanting; though one may deplore the exigency which seems to render it expedient, or miss in the metempsychosis the familiar aspect and features of its pre-existence.

It is true we who dwell at the "hub" are disposed to feel that Boston is the natural home of all progressive things, the spot where alone they can healthfully thrive, and whence hopefully emanate. And there has been much in its history, as all the world knows, to nurture this persuasion. It is not strange, therefore, despite the happy auguries that accompanied it, that we witnessed the departure of what we had been accustomed to regard as peculiarly our own and possessing a certain indigenous relation to this locality, in some sense our oracle, (if it is lawful for radicals to have one), at least with special endearment and pride, to the care of other hands and to what we are apt to consider a less genial intellectual clime with feelings that were not wholly complacent. But all things change in this changing world. The Boston of to-day, it must be confessed with humiliation, is not the Boston it was once. Nor is the Chicago of to-day, it is safe to assert, I think, exactly the Chicago of twenty years ago, in respect to much which then marked the difference between the Eastern and the Western city, and especially that was incident to the latter's immaturity, rapid growth and the prevailing influence of material pursuits. A leveling process has been going on during these years which has largely reduced the inequalities that they bore in relation to each other. It may seem almost disloyal to write it, but there are some signs that while Chicago has increased Boston has decreased in important particulars. Indeed there are those who boldly intimate, not in Boston of course, that it has lost the literary prominence it so long maintained, that New York has already appropriated the distinction. It must also be admitted that Chicago is no longer to be counted an insignificant competitor in the pursuit of such honors. Certain it is that those who occupy the high places of power in our city at present and exercise a prominent, if not a controlling authority and influence in its educational and public affairs, and give the tone in no small degree to its social life, are as a rule of other than New England birth, and of quite a different type from those who presided in

former days over its interests, when Boston was famous for its genuine social culture, its illustrious names in literature and the professions, its philanthropic spirit and independent thinking.

Nevertheless, there will be for a considerable time to come, with all good wishes for its successor, in this neighborhood and wherever it has gone, among the friends and readers of *The Index*, a feeling of real regret at its decease and a deep sense of deprivation at the loss of its accustomed weekly visits. Its record has been in all respects a noble one. No journal has surpassed it in vigor of thought or critical ability or crowded its columns more fully from week to week with matter worthy of the attention of earnest, truth-seeking, free minded people. It is a fortunate circumstance in connection with the new journalistic enterprise at Chicago, that its editors come to their charge with all the advantages of several years' experience in the same relation to its predecessor; and hence have an intimate acquaintance with the constituency for which they are to fill the office of purveyors. Both the editor in chief and his capable assistant are of New England origin and life long associations, but while this is the case, the former does not go to the West as a stranger. It was his business for years to travel and lecture all over it. Probably there is no one who is personally better known to the liberals of the country whose voice has been heard in so many places or before a greater number of liberal gatherings, like one of old crying in the wilderness — the wilderness in his day of modern errors and superstition — preparing the way for the coming of a higher righteousness and reason. It is thus that the editors of this new organ of liberalism are to assume the trust assigned them with eminent qualifications adequately to appreciate and sympathize with the characteristics and peculiarities of East and West alike. It seems, therefore, as though nothing remains, but for earnest liberals of both sections, in fact everywhere, to give the new enterprise their cordial and helpful support. All hail! then, we say, to THE OPEN COURT, may it live long and prosper. We pass to other matters.

The two Sams, Small and Jones, have come and gone. The event may not be one of great interest to liberals, but it has been to the orthodox world in this vicinity and the public in general. I fear that *veni, vidi, vici*, can hardly be written of their visit. There are still unmistakable signs that Boston is not saved, after all the nine days' sensation of their preaching. The course of things does not appear to have changed, but to all outward discernment proceeds as before. I do not hear of less arrests at the station houses. The liquor traffic seems as flourishing as ever. I do not believe anyone can point to a single saloon, after all this tremendous charge upon satanic strong holds, that has been closed. The number of the poor wretches who stagger through the streets has not apparently diminished. Teamsters and herdic drivers are no gentler, so far as I can see, in their manners, nor do they swear less vigorously at each other upon slight provocations. What is the good of all this turmoil and pow-wow if simply those who are tolerably decent and respectable already, from whom the community has little if anything to fear, are the chief conversions? The sceptical, in view of these things, cannot refrain from the question, whether, if the same amount of zeal and money had been spent in labors to alleviate the actual misery which always exists in all great cities like ours, and especially at this season, it might not have been a work as urgent and important as efforts so largely influenced by mediæval views of the misery of another and future state of existence. And yet it must be confessed that, for those on certain planes of life, there is a power in this old theology and its methods which more enlightened conceptions and processes do not possess, a power to lift them up, perchance, a little higher in the scale of being. Unfortunately, this lifting process is one that has to be pretty often repeated in some instances, and the attitude attained is not even

then a very commanding one. Other evangelists, it is announced, are to follow those just mentioned, indeed have already begun their work. In fact, it looks as if Boston was about to undergo a siege from these invaders.

This is one way of trying to make the world better, of seeking to reclaim the wicked and degraded of our city, but I confess I am more disposed to believe in the worth of the results of such a plan as that proposed for our North End wards by Hon. George S. Hale at a recent meeting of the Unitarian club. It is to provide a simple and spacious building in that part of the city, which is chiefly occupied by foreigners and the poorer classes of people, which shall contain "a coffee house or restaurant for uninjurious refreshments; a regulated pawnbroker's shop where the poor and needy may obtain loans, without extortion, on their humble securities; an attractive hall where, for a moderate price, simple and innocent amusements may be offered freely during the week to tempt those it is desired to reach from those dangerous and vulgar and where there may be temperance meetings and others for open and friendly discussions of political and social questions, popular lectures and classes, athletic exercises, rooms for games of billiards, draughts, dominoes, bagatelle, for smoking and reading, for friendly societies, and on Sunday for religious services with music and choir, not limited to any sect or faith; where the Knights of Labor, the members of trades Unions and their employers may meet for friendly discussion and conference. 'I would throw open these rooms and halls,' said the essayist, 'to every man of orderly speech and life who, in honesty, felt he had a mission to the rich and poor — I would not inquire into his theology or his political and social orthodoxy, but I would 'hear his cry.'" This is the liberal "plan of salvation" for the sinning and "poor and needy." Its practical character is too obvious to need commendation.

The epidemic of strikes, so prevalent throughout the country nowadays, and of which this part, it would seem, had hitherto had its share, has been especially violent of late in this city. The outbreak began this time, with the strike of the conductors and drivers of the South Boston horse railroad company. This was followed a few day later, by a general strike on all the lines of the Cambridge roads connecting with the city, thus throwing several hundred unemployed men into the streets, with all the liability to turbulence and danger to the public which such a state of things engenders. As both roads run through sections occupied by the worst class of our people, acts of violence and lawlessness have attended the running of the cars in these localities, especially at night and on Sundays, to a very alarming extent and have made policemen's duties along the route something more than a sinecure or idle pastime. The substitutes, or "scab" conductors and drivers have been subjected to continual annoyances on their trips from the beginning to the end, and have held their places in the face of most exasperating and deadly perils. They have been hooted at, some of them fiercely assaulted and knocked from their cars, and have met with severe bodily injuries, while brickbats and paving stones, hurled through the windows of the cars, have rendered the experiences of those inside more exciting than agreeable. After a number of weeks of this state of things in our good city of Boston, the strikers on the Cambridge roads voted to give up the strike, and those on the South Boston road soon followed their example. What is the lesson? The companies have been very much embarrassed in their business, and the community in general in its interest and convenience. The men, too, have lost much. Perhaps in proportion to their means more than all others. They have been for weeks unemployed, with loss of wages, living on previous earnings, or incurring debts, while both they and their families have suffered much privation. The question arises in view of these events, whether there is not some more excellent

way than the way of the strike for the workingman to adopt to establish equitable or satisfactory relations between him and his employer and obtain the rights which belong to his labor.

Here in Massachusetts there still linger, as is well known, many of the vestiges of the code of the Puritans in our statutes, and especially in regard to the observance of Sunday. There has been a good deal of radical and legislative powder and dynamite of a verbal sort expended first and last to get rid of them, but with little more effect than a like assault upon the rock of Gibraltar. Within the last year there has been a strenuous effort to put these existing Sunday laws in force. What is the use, we may presume our astute or pious legislators reasoned, to have Sunday laws and make no use of them? So the edict went forth in many places that the barbers and bakers, druggists and news venders, and all who did business on the "Lord's day" should henceforth cease from these occupations on that day. The surest way of getting rid of obnoxious laws, it is often said, is to try to enforce them. The saying seems to be verified in this instance. The subject has already occupied much of the attention of the present session of our legislature and is not yet disposed of. Different bills have been presented and discussed, each prepared with the intent of satisfying, so far as possible, the orthodox conscience and intolerance on the one hand and the necessities of our modern life and the growth of rational intelligence on the other. A task that is not altogether an easy one.

There seems some prospect that Boston may soon follow the lead of some of the cities of the country, Chicago among the rest, I believe, in providing police stations with matrons to have charge of women under arrest at these places. The matter is eliciting much public interest and is warmly endorsed by the governor, the mayor and many of our leading citizens and philanthropists. It is hardly creditable to Boston, in view of the number of cities in which this custom exists, that it should have waited so long before waking up to an act of so simple and obvious humanity.

Boston abounds in clubs. Their growth has been very rapid within the last few years, and the number continually increases. We have women's clubs and men's clubs, church clubs and political clubs, college clubs, musical clubs, art clubs, literary clubs, schoolmasters' clubs, business and trade clubs, and often a number of any single one of these varieties. Indeed, the remark has been made that it is likely to be a distinction in Boston by and by for a person not to belong to a club. Among these numerous and various clubs it may be of interest to know that liberals also possess a distinct representation. The Liberal Union club has been some three or four years in existence. It has a membership of a hundred or thereabouts of liberals distinguished for character and intelligence. The president is Mr. Francis E. Abbott, the projector of *The Index*, and for many years its brave and brilliant editor. The meetings occur on the last Saturday of each month at Young's Hotel, the favorite resort of such gatherings, whose elegance of accommodation, appointments and service, and artistic culinary skill is not surpassed by any similar establishment probably in the country. The programme on these occasions consists of a supper, which is pretty sure of appreciation at least, whatever may be the fate of its other parts, and an essay, with addresses, with some musical or other entertaining exercises interspersed at fitting points in the course of the evening. The February meeting of the club was a red-letter night in its history. It was distinguished as "ladies' night," a new departure for the club. In other words the members were expected to bring ladies with them, one each at least, as guests of the evening. The proposition was received with favor. It gave the members an opportunity to show their wives and daughters, or some one's else wives and daughters, as the case might be, how their evenings were passed at the club meetings. The attendance

on this occasion was between sixty and seventy. Miss Mary F. Eastman, the essayist of the evening, spoke on "Our Duty to Speak our Utmost Thought;" the paper was vivacious and pleasing and not too heavy for an after dinner exercise. Miss Eastman was followed by the venerable Mrs. E. D. Cheney, who, with a few appropriate words, beamed her motherly benediction on the occasion. Mr. W. L. Garrison, in easy flowing verse, gave expression to some of his "utmost thoughts." One was, ladies should also be members of the club, and another, that wine and cigars should be excluded. Here endeth the first letter, and too long a one, I fear, of your Boston correspondent. CLAYTON.

HOW SUNDAY LAWS ARE MANUFACTURED.

To the Editors:

BOSTON, March 17, 1880.

The recent debate of two hours in the Massachusetts House of Representatives showed me, not only how such laws are made, but how they can be amended. The speakers cared little for abstract principles; but all agreed in their desire to come up fully to the standard of public opinion, and to whatever the people asked. There is good reason to believe that the laws against Sunday travel and Saturday evening amusements will be repealed, and also that the business now done illegally on "the Lord's day" by milkmen, newsboys, barbers, bakers, telegraph operators, gasmen, stablemen, druggists, horse-car people, printers, and other indispensable criminals, will be legalized by special exceptions to the general prohibition of business and labor. It is still a question how far these kinds of Sabbath-breaking are to be limited to special hours, and whether people who keep the real Bible Sabbath every Saturday, are to be permitted to open their shops and expose their wares for sale. It should be remembered, that in all other respects they have been allowed to labor and do business for the last fifty years, and that the request to be allowed to show goods publicly, as well as to sell them privately, does not appear to come from the most enlightened members of the body. The most important difference is about amusement, some members calling for total abolition of what they stigmatize as the blue laws, while others oppose letting of boats, etc., and insist that nothing more lively should be permitted than a concert of sacred music. One Solon, professing to speak from a purely humanitarian point of view, said: "The Sabbath is made for man, not man for the Sabbath; and for this reason there ought not to be any recreation on Sunday." Others protested for amusements in the name of the poor. Still, whatever disagreement there is in the State House is due to the different habits prevailing among the people. Our legislators all wish to ratify what has already been decided by public opinion, but they are not likely to go any further in reform.

Whatever is done in repealing the laws against Sunday travel, or particular kinds of business, or Saturday evening amusements will be done not to open agitation but to the quiet agreement of the whole community to treat all this part of our legislation as null and void. I remember when our theatres used to announce that they would give performances Saturday evening, in order to test the law. Here in Massachusetts a statute has to be tried and found wanting, before it can be repealed. Our legislators say plainly: "If you will prove that the law against Sunday amusements cannot be enforced, we are willing to alter it; but so long as the community submits contentedly, we see no occasion to interfere." For those of us that think, as I do, that more freedom in Sunday recreation is necessary for the health and good behavior of our people, especially the poor, our duty is plain and urgent. It is not preaching but example that will do the work.

H.

Is there, then, no death for a word once spoken?
Was never a deed but left its token?
Do the elements subtle reflections give?
Do pictures of all the ages live
On Nature's infinite negative?—Whittier.

DEATH IN THE CAGE.

BY GEORGE WENTZ.

In China old, in any city street,
 You still may see what stirs your noble rage,
 Yet scarce gives pause to any passing feet—
 A man within a cage!

A narrow, upright box, so cunning made
 That on his head atop the sun doth pour;
 Hung by his jaws he lacketh much of aid
 From toes that touch its floor.

And there attached a scroll that bears his name,
 His age and race and occupation late,
 His sentence—death—and what he did to shame
 The laws of sov'reign state.

And also this: the penalty extreme
 To him who, softened at the heart, should think,
 However great the culprits' need might seem,
 To give him meat or drink.

And there he hangs, and moans and shrieketh shrill.
 In supplication as you pass his way,
 And then grows faint; but no less pleadeth still
 Tomorrow, as to-day.

But not for aye; quick nature's chord is broke,
 And heart-strings snap when too intense the strain.
 The third day comes; his need is looked, not spoke,
 And he is past his pain.

The air is still; no living sound near by,
 Save where the crowd a little space away
 Strives eagerly, beneath his glazing eye,
 For seats to see a play.

And he is dead! one life the less is nought
 In all the millions that survive in pain;
 When man is valueless, the thought
 Of how he dies is vain.

Now he is dead write China's thousand years
 Beside this woful picture here apart:
 Age may adorn; but how unloved appears
 Gray head that hath no heart!

BOOK NOTICES.

"THE ORIGIN OF THE FITTEST."

The readers of THE OPEN COURT will, I am sure, be grateful for having their attention called to a book just from the press of Appleton & Co., entitled *The Origin of the Fittest*, by our ablest American biologist, E. D. Cope. I do not hesitate to say that, since Darwin and Wallace, no investigation has been more important or more ably conducted than that embodied in this book; and that since Spencer and Lewes no generalizations have been so profound and wonderful. Difficult as the work of the earlier evolutionists was, that of this later or second school is no less so. Darwin assumed, or allowed to rest, the conception of a Creator, only dispensing with the idea of special creations. He distinctly avowed the view of a single primal creation, in which, inherent, was the full potency of self-evolving purposiveness manifested in evolution. This complete "Natura" needed no after-meddlings or supplements, or extra natural miracles. But later evolutionists are quite of a different mind. They have taken

such theists as Diman and Hamilton at their word, when they say, it is "evidently our duty to push the first cause as far back as possible." They have given one final push, and lo, the final cause is not to be found; so the contest stands to-day a simple one between those who assert with Newman, Diman, Mivart, "We believe in One who is apart from, and above Nature, the cause, etc.," and those who find in the manifest substantial universe all of causality. Bishop Foster's idea of creation is probably very nearly the common theistic view, when he says, "The world was fitted up for man's occupancy, with adequate means inherent, or *supplemented*, to meet all his needs." Supplements! to the work of an all-wise Creator! "I thank thee for that word!" It reminds me of an "Appendix" I saw carved to an epitaph on a tombstone in a Western cemetery.

I need not say that "The Origin of the Fittest" is fully committed to the later and broader evolution. It does not hesitate to go back of the "beginnings" of life on our globe and seek for the origin of *life*, and of that which life involves: consciousness, matter and force are the primal trinity which must be accounted for. Are they derivatives or primitives? In other words, are they the constitutive eternal elements? or is there a God, a Being apart from Nature, who either creates matter and force or imparts to eternal matter and force his own sentience?

The one emphatic and descriptive quality of the later evolutionism is the acknowledgement that matter and force alone do not cover the universe as it is, nor as it was primordially. The rhizopod, equally with man, manifests a sensibility and a purposive desire that is not included in the energy that is purely material. Huxley, in his late passage of logic with Mr. Lilly, says, "The main tenet of materialism is, that there is nothing in the universe but matter and force, and that all the phenomena of nature are explicable by deduction from the properties assignable to these two factors; all this I heartily disbelieve." Professor Cope's argument is everywhere underlaid with this presumption, or rather demonstration; for I take it that what a final reduction of the universe in the crucible of analysis insists on giving us, that we must take as demonstrably certain.

So the problem is carried immensely back of Darwinism. The essays entitled "Catagenesis" and "Archæsthetism," I believe to be the two most remarkable and able attempts in metaphysical evolution extant, excepting possibly the accompanying essay, entitled "Consciousness in Evolution." To give a review of such articles would be only to repeat or epitomize them, and the latter attempt would be futile, as the essays are exceedingly concentrated. I will simply suggest one of the final conclusions of Archæsthetism. The question arises whether there may not be in and throughout the universe some generalized form of matter which can sustain consciousness; for clearly, so far as our investigation goes, consciousness is associated only with protoplasm; that is, with a certain specific chemical union of carbon, hydrogen, nitrogen and oxygen. By a course of able reasoning we are led to this conclusion. "The presumption is that such a form of matter may well exist. Evolution or organization has only worked up part of its raw material in the organic world." I wish I could spread before your readers pages of this magnificent generalization. I must not undertake it. Equally powerful is his handling of catagenesis, or retrogressive evolution. The problem is to account for that consciousness, or sentience, or sensibility, or "feeling," as Lewes terms it, which characterizes primordial life, when the common life divergently becomes on the one side animal, on the other vegetable. What does the vegetable kingdom do with this property of sentience, or is it also in reality now a sentient part of the world? Prof. Asa Gray argues that it is sentient. The discussion by Prof. Cope clears the subject of a host of misapprehensions. The key of it

is that energy, as soon as it becomes automatic is no longer conscious. The vegetable kingdom is a display of automatic energy. The animal kingdom is also full of automatism in the form of reflex action or instinct, but is also largely conscious.

Carrying back these general conclusions we reach the final conclusion that mind and matter are no more to be conceived as separable in the universal than in the individual. The individual as such is not dual, but unal, a substantiality. So, of the universal, it can be conceived only as a One, absolute, involving both matter and mind.

"The Origin of the Fittest" is equally valuable as a discussion of organic evolution. It is to Prof. Cope we owe the generalizations, and to a large extent the investigations, connected with the enormous fossil finds in Colorado and throughout the West. In 1874 he foretold that the ancestors of a large group of Tertiary Mammals when found would prove to be pentadactyle, plantigrade bunodont; that is a five-toed walker on the sole of the foot unlike our ruminants, and possessed of tubercular molar teeth. In 1881 the prophecy was fulfilled. The genus, so far best known of this division, is called the phenacodus, but the group is known as condylarthra. Converging in this condylarthra group are traceable backward by nearly complete lines, the ox, deer, camel, hog, hippopotamus, horse; also the carnivorous lion, tiger, wolf, bear; but, above all, the lemur tribe. To this lemur tribe, as a common ancestor, the apes and men are now traceable. Before this work of anatomical biology all other synthetical results stand unified. I look on it as the most superb triumph of science of the last twenty-five years. The article which most explicitly recounts this progress of generalization was published in *The Popular Science Monthly* of September, 1885. But the general results are contained in the volume I have named, "The Origin of the Fittest." The great geological basin of the West has revealed the story of the last five millions of years with an accuracy, that twenty years ago, seemed an absolute impossibility. The Tertiary Mammals are in reality one family, moving out on diverging lines from one ancestral type to become the carnivorous and herbivorous occupants of the globe. Of all these man stands most closely to the original type. He is plantigrade and pentadactyle. The horse, the ox and all the other genera of this stock are in structure, not only more divergent from the ancestral type, but completer in the organic sense, in bone, and muscle and sinew. Fortunately our group made a blunt stop in the way of polishing bones and toughening sinews and put all its energy to brain-building, and on that line, and for that reason, behold man! But I must leave Prof. Cope to speak for himself.

E. D. POWELL.

PARLEYINGS WITH PEOPLE OF IMPORTANCE IN THEIR DAY.
By Robert Browning. Boston: Houghton, Mifflin & Co., 1887;
pp. 187. Price \$1.25.

Browning apparently intended gently to "point a moral" by the title of this latest work of his pen, that moral being the evanescent nature of certain sorts of fame, for none of his "people of importance in their day" excepting Fust, the inventor of printing, will be readily recognized by the general readers of this; they are Bernard de Mandeville, a venal writer who had no perceptible faith in the good and true in human nature; Daniel Bartoli, a chronicler of pious legends; Christopher Smart, whose only "smartness" or perhaps inspiration was shown by a poem scratched by him on the walls of a mad-house where he was confined because of insanity; George Budd Doddington, whose superficial scheming secured him a title; Francis Furini, an artist whose specialty was as a painter of the nude human form; Gerard de Laresse, an artist who, losing his sight, was yet so enthusiastic over his calling that he dictated a work in eulogy of it, and Charles Avison, a composer of simple marches. These

"parleyings" give one the impression that Browning has summoned "from the vasty deep" or some similar place, the restless ghosts of these "people of importance" to whom he deals out in his own infinitely vague and "I-know-it-all" sort of way, master-like philosophical deductions from possible (though rather improbable) lessons from their lives and works. To the commonplace reader, the strongest and clearest poems of the book are those which open and close the volume,—the prologue entitled "Apollo and the Fates," and the epilogue "Fust and His Friends",—but there are clear-cut, cameo-like, robust bits of verse, appreciable by all, in most of the poems, in proof whereof we quote sparingly from much that invites. Says Apollo, in the prologue arguing with the remorseless Fates for the life of Admetus:

"'Tis man's to explore
Up and down, inch by inch, with the taper his reason:
No torch, it suffices—held deftly and straight.
Eyes, purblind at first, feel their way in due season,
Accept good with bad, till unseemly debate
Turns concord,—despair, acquiescence in fate."

From "Francis Furini" we take this recognition of the wide scope of scientific investigation:

"Science takes thereto—
Encourages the meanest who has racked
Nature until he gains from her some fact,
To state what truth is from his point of view,
Mercy pin-point though it be. Since many such
Conduce to make a whole, she bids our friend
Come forward unabashed and haply lend
His little life-experience to our much
Of modern knowledge."

In the same poem Browning puts into definite form a question which has doubtless arisen in the minds of many thinkers who have hesitated over the dubious word:

"'Soul'—accept
A word which vaguely names what no adept
In word-use, fits and fixes, so that still
Thing shall not slip word's fetter, and remain
Innominate as first, yet, free again
Is no less recognized the absolute
Fact underlying that same other fact
Concerning which no cavil can dispute
Our nomenclature when we call it 'Mind'—
Something not Matter—'Soul' who seeks shall find
Distinct beneath that something."

In this poem the theory of evolution is criticised from the poet's peculiar point of view, strongly, of course, though uniquely.

OPINIONS OF THE OPEN COURT.

THE COURT opens gloriously and I hope it will examine and decide all questions within its jurisdiction in the same masterly way *The Index* did.—FRED BECK, Boston.

THE OPEN COURT more than fills the gap left by the suspension of *The Index*.—MRS. MARY GUNNING, Florida.

In body and dress it exceeds what I had expected. There is a beauty about its face and a free intelligence gleaming through its matter which becomes at once an allurements. And I, of course, wish you speed and lasting possibilities.—H. L. TRAYNELL.

THE OPEN COURT opens splendidly. The articles I have been able to read are very rich and suggestive.—CHAS. D. B. MILLS.

THE OPEN COURT received, I am more than pleased with its appearance and contents. It is a publication that cannot be overpraised and one which deserves more than praise—*financially* *suppo* l.—HARRY HOOVER, Pittsburgh, Pa.

THE OPEN COURT looks well, reads well, promises well. Its success depends, I think, upon its being a *Journal*. It must grapple with passing events and give the news of "the movement." Essays may help, but cannot give success.
JAMES PARTON.

I have just read through the third number of THE OPEN COURT, and congratulate you on its excellence. It seems to me that the three numbers thus far issued may be compared as good, better, best.
ROWLAND CONNOR.

"The Court," OPEN COURT, is a most admirable and fortunate title. Everybody smiles when shown it, and some have pleasant remarks concerning it. Judge — likes this "judicial title." "Yes, yes," said one gentleman, "that's what we need—an 'open court!' I suppose you will give a fellow a chance to jaw back?"
G. P. DELEPLAINE, Madison, Wis.

LABOR CRANKS.

BY JAMES PARTON.

The most interesting passage in Harriet Martineau's *Retrospect of Western Travel* is one in which she describes the three eminent senators, Clay, Webster and Calhoun, as they appeared to her in 1836, when they were in the prime of their celebrity and power. She heard them in the senate and spent many evenings with them in the most intimate and familiar converse. She speaks of Henry Clay sitting upright on the sofa, with his snuff-box always in his hand, discoursing for many an hour in his soft and deliberate tone, on some leading subject of American politics. What surprised her was the moderation of his judgments of men and things, knowing well what an impetuous spirit he had derived from nature and circumstances.

She describes Webster, too, not merely as the giant debater of the senate, but also as the delightful companion, leaning back at his ease, telling stories, cracking jokes, shaking the sofa with burst after burst of laughter, occasionally rising into serious discourse, to the perfect felicity of intelligent hearers. The picture she draws of these two famous men gives us the idea of sanity and cheerfulness; of men with great powers employed in high, congenial tasks; not indeed devoid of ambition, but possessing also a genuine and over-mastering public spirit.

Her account of Calhoun is sadly different. She speaks of him as the cast-iron man, who looked as if he had never been born and could never be extinguished; full of close, rapid, theoretical, illustrated talk, which kept the understanding of the hearer on a painful stretch, but left it unenlightened and unconvinced. He had but one subject of discourse, a theory of government narrowed to the dimensions of South Carolina, and forced to include as integral parts Slavery and Nullification. It was interesting to hear him, because all that he said gave evidence of intellectual power, but the final impression left upon the stranger's mind was one of absolute melancholy.

"His mind," she remarks, "has long *lost all power of communicating with any other*. I know of no man who lives in such utter intellectual solitude. He meets men and harangues by the fireside as in the senate; he is wrought like a piece of machinery, set going vehemently by a weight, and stops while you answer; he

either passes by what you say or twists it into a suitability with what is in his head, and begins to lecture again. * * * Relaxation is no longer in the power of his will. I never saw anyone who so completely gave me the idea of *possession*."

In these few words of Miss Martineau's we have an excellent description of that type of man to which we now give familiarly the name of crank, the man who has become unteachable, or, as the lady says, has lost the power of communicating with other minds. This, I should say, is the special characteristic of the man who harps upon one idea. He never views it by the light of other minds; he never sees it in its relation to other ideas.

That was a great touch of Miss Martineau—"he had lost the power of communicating with other minds"—and it describes many of our too positive brethren of to-day. Many of them are of a far nobler type of man than Calhoun, because they lost a portion of their sanity through an honest and overwhelming compassion for the human lot. A very large number of people are in danger of getting cranky from this cause; not that men are more unhappy now than formerly, but because we have become more susceptible to their unhappiness. We are less able than we once were to sit down content with a fortunate destiny, while there is misery close by. France had never been in a condition less bad than in 1789, when the revolution broke out. She had become aware of her unhappiness, and the discovery drove her mad.

Probably no man who, touched by human sorrow, honestly tries to relieve it, ever quite fails to be of service, because even if he tries in wrong ways, his errors are instructive. At least, he may call attention to evils which he is himself powerless to remedy, as the midnight shriek of a woman who sees a rock ahead while the helmsman nods at his post, may save the ship. The shriek is heard; it wakes the man at the wheel; it calls the captain; it alarms the crew; and the vessel sheers away from the rock-bound cape in time.

On the other hand, no one is more likely to get cranky in his opinions than one who broods too much over the sorrows of mankind. A person of tender heart, young, unused to the sight of suffering, little acquainted with the past history of our race—its slow and hard struggle from want almost universal to plenty

almost universal—may very easily get astray, and give passionate credence to fallacious theories. Perhaps I may be pardoned for alluding to my own experience, the recollection of which suggested this subject, and has enabled me to explain many wild theories and many one-sided men.

At the age of twenty, during a year's residence in England, I was taken to visit one of those vast poor-houses, then called Unions, in which the paupers of several parishes, sometimes thousands in number, were, for the sake of economy, maintained together. It was an appalling spectacle to one who had never before seen destitution except as an obvious result of vice or sudden calamity. I beheld immense numbers of paupers in a county teeming with luxuriant crops, and those paupers not of alien race, but natives of that soil, not vicious, not degraded, but, apparently, well-disposed, respectable persons, some of them having a striking aspect of purity and refinement. What startled and shamed me most was the deference these unhappy people paid to the visitors. When we entered the wash-house, for example, where a hundred clean, orderly, and nice-looking women, all dressed in blue, were ranged along on both sides bobbing up and down over their tubs, they all stopped, stood erect, made two quick but low curtsies, and then resumed their work.

This was too horrible. I felt myself blushing scarlet, and hurried out of the room in an agony of shame and pity. But into whatever other room we entered, this uniform double curtsey was repeated; as if it was not we who should bow low to *them*, and humbly apologize to *them* for our insolence in enjoying freedom and plenty. At last, I saw something which broke me down completely. It was an interview between a mother and her son, a boy of fourteen, who had been allowed by the officers of the poor-house to join the drum-corps of a regiment of infantry under orders for India. She had just been told of it, and she was trying to understand it; trying to grasp the idea that her boy, the only solace left to her, was about to march from his native parish, never to return while she lived. Her grief, her despair, her awful silence and stillness, her infinite and irremediable desolation, were far beyond words to describe. I have never been so near insanity as I was during the rest of that day, and I did not quite recover my serenity until I had got out of the country. I am conscious that I had a narrow escape, if I did escape, from being a labor crank. Such a scene gets the understanding under, and may easily disqualify a person from thinking beneficially.

The very same spectacle, which could then be seen in every county of England and Scotland, caused Carlyle to write a harrowing book on the subject, called *Past and Present*, in which he painted the evil with terrific force, but suggested remedies of the most frivolous

inadequacy. He was a crank, made such by egotism and imperfect knowledge. Two other men of healthy minds and generous hearts, Richard Cobden and John Bright, took off their coats, as Mr. Parnell expresses it, and worked with all their might for six years in getting the Corn Laws repealed, which gave to the people of Great Britain cheap food, and thus reduced pauperism to endurable proportions for thirty years.

"The dismal science," was what Carlyle called political economy. He was a crank who had lost the power of being instructed by other minds—not ignorant merely, but a despiser of knowledge. Cobden took *one leaf* out of that dismal science, set free those paupers and gave his country another chance. Cobden was a modest, teachable, great man, infinitely removed from crankiness.

The eminent crank of political economy, the perfect type of the class, was Fourier, whom Horace Greeley introduced to our notice in the *Tribune* forty years ago. In the year 1799, during a period of scarcity in France, he was a merchant's clerk at Marseilles, in the employment of a firm engaged in importing provisions. They had a large quantity of rice on hand, a leading article in food in Southern France. In order to maintain the price of this commodity, his firm kept a cargo so long during the hot weeks of the summer that it was spoiled, and young Fourier was sent on board of the vessel to superintend its destruction by the crew. The rice, I believe, was thrown overboard.

This clerk was a young man; he was benevolent, and at this time he was filled with compassion for the sufferings of the poor in Marseilles, whom this rice would have relieved, and, particularly, the sick in the hospitals, for many of whom in the climate of the Mediterranean, rice is the only food and the best medicine. The destruction of the rice, which seemed to him so wantonly cruel, rankled in his mind, and appears to have destroyed his power to communicate beneficially with other minds. Instead, therefore, of making an extensive and modest study of the vast and complicated system by which the human race is supplied with the necessaries of life, he retired within himself, went apart from men and business, and came rapidly to the conclusion, so congenial to cranks, that whatever is, is wrong. He developed what we call Fourierism, or, as he termed it with the modesty of his type of reformer, "a system which will deliver the human race from civilized chaos." Who has written more eloquently of the evils of the world and the sufferings of mankind? He described commerce as the art of buying for three francs a thing worth six, and selling for six francs a thing worth three. But the world has gone its way, and whatever improvement has been made in the lot of mortals since Fourier's time has been wrought by men not perhaps more benevolent than he, but more modest, better informed, men

who, before attempting to serve our race, have put themselves humbly at school to its long experience.

We have among us at this time an uncommonly gifted writer, a good citizen, a benevolent man, who during the forming period of his mind had opportunities to study closely three countries in which the people were wrongly related to the land. This man is Henry George, and those three countries were India, California and Ireland. In California fifteen years ago, the huge land grants of the Spanish proprietors made it extremely difficult for men of moderate means to procure land enough for a modest American farm, and this at a time when the towns of California were overflowing with adventurers, who had obeyed Horace Greeley's well-known injunction, until they had reached the Pacific ocean and there was no more West for the young man to go to. Brooding over this state of things he came to the conclusion that the land, like the air and the sea, belongs to all the people alike, and that private ownership of land is wrong. The nation, he tells us, should own the land and draw from it, and from it alone, all the public revenue. As he stood at his printer's case he reflected perhaps too long and too exclusively upon the scene around him, and upon the similar difficulties in Ireland and India.

In his eloquent book upon *Progress and Poverty*, he appears to me to have escaped a great and invaluable truth, applicable to all property and to all countries, which is that every right of man is a limited right, not absolute, and that a man must hold whatever he possesses in subordination to the welfare of the community of which he is a part. But this precious truth is not new. Every system of law and morals recognizes it. With his gifted pen and benevolent mind he may yet throw valuable light upon it, and suggest safe and just ways in which the rights of individuals may be still further subordinated to the interests of the public. Take Henry George, however, for all in all, and we may call him one of the most estimable and reasonable of the reformers of our day. If he is now shut up in a narrow theory, there was a time when he studied the works of other economists. He may do so again.

The men who really help us to a better life and a happier lot are tolerant, patient, modest and good-natured. They may be students, like Newton, Adam Smith and Darwin; legislators, like Cobden and Gladstone; statesmen, like Jefferson and Lincoln; warriors, like Washington, Sherman and Grant; but they are all patient, open to conviction and accessible to other minds; well pleased if they can succeed in elucidating one truth, or in mitigating ever so little the lot of man. The great are all teachable. They never lose the power of communicating with others.

One of the beneficial effects of the clubs and societies, now so common among us, is in making us

acquainted with other minds, and in subjecting our favorite opinions to free comment and criticism. Free and friendly intercourse with other minds, widely different from our own, is the natural remedy for crankiness.

"Good-bye, Butterworth," cried Mr. Twigg, of Virginia, as the late House of Representatives was dispersing on the 4th of March. Mr. Twigg is a democrat, and was a secessionist; Mr. Butterworth is a republican from Ohio. "Good-bye, Butterworth: I never thought I could like a republican; but two years' experience has liberalized me greatly, and I now have as many republican friends as any man in the House."

The intelligent reporter who overheard this remark, appended to it a comment which is worth repeating:

"What Mr. Twiggs said is true of every new man. He comes to Washington a partisan" [possibly a crank] "believing that all the good is in his own party and all the bad in the other. Before he has served one session he has learned to esteem his opponents quite as much as his party friends. He serves on committees with republicans and democrats alike. Before his term expires he realizes that human nature is—human nature, no matter what its political convictions may be."

All of which confirms our principle that the source of human wisdom is the whole of human experience interpreted by the whole of human intelligence. To afford access to this multitudinous sea is, I suppose, the proper object of education, and the chief benefit of your OPEN COURT.

REASON AND PREDISPOSITION.

BY JOHN BURROUGHS.

That most men in the formation of their opinions are governed more by predisposition, or unconscious bent and tendency, than by reason, is obvious enough. Indeed, reason is the faculty by which we seek to justify the course of this deeper seated predetermining force or bent. We gravitate naturally to this opinion or to that, to conservatism or to radicalism, to realism or to idealism, and we seek for reasons that favor *our* course. Considerations which are of great force with certain types of mind are of little or no force with certain other types. Reasons that confirm what we already believe or want to believe, how forcible they are! But if they point the other way how lightly we esteem them!

Thus, Irenaus, the real founder of the Christian canon, was led to believe there could be no more and no fewer than four Gospels, because there were four universal winds and four quarters of the earth, and because living creatures were quadriform. So Justin Martyr argues that because Jesus blessed the juice of the grape and said "this is my blood," he could have had no human parentage, but was the son of that God who made the grape and the vine. This is giving a natural basis to dogma in a quite unexpected way.

With most men reason is an advocate and not a judge. It does not so much try the case as plead the case. Unless we watch ourselves very closely, instead of trying to see all things in their true light, we will find ourselves trying to see only those things that favor our view.

Reason is probably only a secondary faculty after all; or more strictly, it is a *faculty* and not a determining power. It is like the compass which the sailor takes to sea with him and to which he constantly refers in keeping his course, but which has nothing to do in determining that course. Every man goes his own way, and of the agents that determine him in any given direction, whether original bent, inherited traits, the influence of his training, or of his environment, he is but dimly conscious; his reason is the conscious instrument by which he tries to steer on his predetermined way.

Hence it is, that Cardinal Newman says, that in his going over to Rome it was not logic that carried him on; "as well might one say that the quicksilver in the barometer changes the weather. It is the concrete being that reasons; pass a number of years and I find my mind in a new place; how? the whole man moves; paper logic is but the record of it." The great Cardinal may have been logical after he once started for Rome, but what made him drift that way? It was because he was a born papist from the first; one can see the stamp of Rome upon him in his youth.

Probably most of us come into possession of our religious beliefs in the same way Newman did—we grow into them; they are slowly and unconsciously built up in our minds. We think we reason ourselves into them, but we find ourselves in possession of them, and then we seek to justify our course by an appeal to reason. In our day religious opinion, or religious feeling, sets less and less store by dogmas and creeds, and it is because, as Newman suggests, there has been a change in the weather. Yea, a change of climate. Natural knowledge is in the ascendant. The sun of science has actually risen, indeed, rides high up in the heavens, and the things proper to the twilight or half knowledge of a few centuries ago, flee away, or are seen to be shadows and illusions. The great mother Church may draw her curtains, and re-trim her lamps and make believe it is still night in the world, but those outside know better, and those inside are bound to find it out by and by. Newman is a careful reasoner, but what would satisfy his mind will not satisfy all, because we are not all going his way. What is a fair breeze to one may not be a fair breeze to another. See how easily he accepts the doctrine of transubstantiation: "Why should it not be? What's to hinder it? What do I know of substance and matter? Just as much as the greatest philosopher, and that is nothing at all!" Might not we reason in the same way? Why should not Santa Claus come

down the chimney? What's to hinder? The chimney is open at top and bottom, and has a definite capacity of good, honest cubic inches. At the same time do not we children of an older growth ask *does Santa Claus come down the chimney?* This author of the *Grammar of Assent*, assents to the doctrine of the Immaculate Conception on scarcely more tangible grounds, namely, "because it so intimately harmonizes with that circle of recognized dogmatic truths, into which it has been recently received." The mind bent upon truth alone, would be inclined to ask, "does it harmonize with the rest of our knowledge of the world? Does it agree with what we know to be facts governing human propagation?"

The great Romanist reasons himself into the belief in the infallibility of the Pope in about the same way. He makes certain startling assumptions to set out with,—supposing this and that to be true the infallibility of the Pope naturally follows. "Supposing it to be the will of the Creator to interfere in human affairs, and to make provision for retaining in the world a knowledge of Himself, so definite and distinct as to be proof against the energy of human skepticism, in such a case,—I am far from saying that there was no other way,—but there is nothing to surprise the mind, if He should think fit to introduce a power into the world, invested with the prerogative of infallibility in religious matters." But has he introduced such a power; what is the proof of the fact? *Are* the Christmas stockings filled by way of the chimney? The fact Newman accepts and reasons from it, or to it, as we see. His reason follows his belief, never leads it. Any number of difficulties, intellectual difficulties, he says does not make a doubt. Certainly not where experience attests the thing to be true. But suppose it is contrary to all experience, contrary to all the principles upon which human observation is founded—how then?

Of course we are not always to reject a proposition simply because we cannot understand it or penetrate it with the light of reason. We do not know how or why species vary, but we know they do vary. We do not understand the laws of heredity, but we know heredity to be a fact, and so with thousands of other things. Do we know transubstantiation to be a fact? There are difficulties in the way of evolution, but these difficulties are not such as violate nature, but such as indicate that nature may have taken another course in the production of species. The difficulties in the way of believing in the efficacy of holy-water, or that the image of the Madonna winked, or that Elisha made iron swim, are of quite another sort; these assumptions contravene all the rest of our knowledge.

Our theological doctors talk about the short range of the *unaided* reason of man, and seek to show how revelation comes to the *aid* of reason; as if the reason could

be aided by anything but reason, by anything reason does not approve of or comprehend. They mean, of course, that the truths of revelation could not be reached by the unaided reason. But are they *truths*? the reason asks. Certainly reason could not lead a man to them, and it requires something different from reason to hold the man to them after he is there. To talk about aiding the reason by a superior principle of knowledge, or a superior method of verification, is like talking about seeing around a corner, or on the other side of a stone wall. The very principle you propose must itself be approved by the reason. Microscopes and telescopes aid the eye by multiplying and extending its powers in its own direction; not by the addition of any new principle of vision. In the same way the discovery of the law of gravitation or the laws of Kepler, arms and extends the human reason, of which they are the fruit. Power alone can use power, the eye alone can use the telescope, not the hand or the ear.

THE RADICAL.

BY EDNAH D. CHENEY.

Having occasion to look over numbers of the *Radical*—published from about 1865 to 1872—I was struck with the force and ability displayed in its pages, and led to compare the movement which it represented with that of the transcendentalists, about thirty years earlier, whose organ was the now famous *Dial*.

The latter movement is now recognized as having had great life-giving power, and its inspiration has not yet lost its hold on many minds. It was full of youth, freshness and beauty. It opened up broad avenues of thought and life, and returned to the original fountains of spiritual truth, instead of drinking of stagnant cisterns, no longer renewed by the pure rains of heaven.

And yet as I read the pages of the *Radical*, I recognized a real advance in the movement which it represented over that of the transcendentalists. No sharp and definite line can be drawn between them, for both were in the same direction and in many instances the same minds took part in both; but still the comparison is of interest.

No organization beyond a social club was attempted by the transcendentalists, and the expression of individual thought was perfectly free and spontaneous. Yet there is a general agreement in aim, and a similarity in expression which gives a distinctive character to the *Dial*. It is like a blossoming out of the Unitarian faith into beauty and fragrance, for it is full of the joy of religion and of the value of æsthetic culture. It does not, generally, deal with important moral questions practically, but by appeals to the higher intuitions. It is rather artistic than scientific.

The radical movement attempted organization in the Free Religious Association, but it has hardly been an

instrument of much work, or a very binding tie. Yet it has had great value in giving this most expressive name which binds together freedom and religion in a true wedlock, instead of separating them as things hostile or alien.

Most of the writers in the *Radical* base their speculations less upon intuitions and more upon established facts than the transcendentalists, and they do not shrink from the keenest criticism of anything, however venerable, or the plainest words into which their thought can be put.

To them, I think, we are largely indebted for the greatest step in modern liberalism, which reached a position outside of Christianity, from which it can be looked at in fair comparison with other religions. This is such a gain as astronomy made when Copernicus dared to teach that the sun was not the center of the universe; it alone made it possible to bring all the religious experience of humanity into harmony and order. Great minds had certainly gone beyond the narrow limits of their own faith and recognized truth in ancient and modern religions. Emerson had already said: "Jesus would absorb the world, but Tom Paine and every coarse blasphemer helps us to resist Jesus." Theodore Parker had planned his *History of Religion*, but even he had said: "Silence the voice of Christianity and the world is well-nigh dumb," and he contended stoutly for his right to the name, which he held above every name.

But the new movement did not claim the name of Christian. It took the altitude of every religious star, not from its relation to Christianity but to eternal truth, and freely opened its platform to representatives of every form of worship.

So evidently was the time ripe for this step, and so successful has it been, that what required courage to profess in 1865 and '66 is now the fashion, and the representatives of heathen religions, not converts to Christianity, (although generally shaming Christians by the justice and liberality with which they revere the character of its founder), are welcomed to orthodox pulpits and are courted in society. There is even danger that a tide of Orientalism, with its fascinating speculation, may sweep over us and carry away many useful landmarks and guideboards which the human race has set up in its onward march. It will not destroy the foundations of the earth.

This movement for broadening the sympathies of religious faith has had the powerful aid, without which it could not have been successful, of the great freedom of intercourse between distant nations, of the advance in Oriental scholarship, and of the great scientific movement which has put all thinking upon more exact and stable basis.

The thinkers who expressed themselves in the *Radical* have done but small portion of this work, but they

have recognized its meaning and value, and applied it in their own domain of religious thought. T. W. Higginson's *Sympathy of Religions*, William Henry Channing's lectures on Eastern religions, and Samuel Johnson's noble volumes on India, China and Persia, show the power thus gained of looking at the past or present history and thought of the human race; not from any personal standpoint, but as related to the whole evolution of thought in history. It does not seem possible that any enlightened class can ever again return to the bigotry that looks upon all who are not born within the shadow of the cross, as miserable heathen living "where God was never known."

It is true we have yet Andover discussions, but they only serve to show what a vital question this has become, and that some, even of the missionaries, have learned that they must understand and respect the piety of the people to whom they are sent, and not shock their filial reverence by offering them a heaven from which their venerated ancestors are forever excluded.

So rapidly has the work which the *Radical* and the Free Religious Association proposed to do, extended in all directions, that we cannot trace it to its distinct sources, nor say how large a part this or that agency has had in bringing it about. Yet in looking over the old monthly once so welcome a guest, I could not but wish to acknowledge an indebtedness to it for sowing broadcast the germs of much of the good which we are reaping now.

The work which lies before us yet is less revolutionary and exciting. It is the use of the freedom that has been already gained, in the close application of great truths to practical problems. We need more of close study, severe thinking and careful experiment, before we can claim that we have put theology upon a true scientific basis and given it its true position as solving all the great questions of human experience.

A SORELY TEMPTED GENERATION.

BY ALFRED H. PETERS.

During the last fifteen years there has been, throughout the northern United States, a remarkable number of criminal downfalls among business men. Petty officials, public and private, have been constantly reported short in their accounts, and "Behold a city for sale," has twice been shown to be as true of the American metropolis, as it was when the African prince declared the same of the metropolis of ancient Rome. When, beside these disclosures, it has become necessary to reinforce the officers of the law with a numerous body of private detectives; when all kinds of mechanical contrivances are being resorted to in place of conscience; when the cities of a border nation are filled with a permanent population of our fugitive thieves, is there not reason for inquiry why it is

so much harder for men to be honest than it was a generation ago.

If, as certain later economists affirm, the degree of a nation's civilization is determined by the number of its wants, greater progress has been made toward that condition during the last twenty-five years by our own than during its whole previous existence. Not, indeed, intellectually, or physically, so far as concerns human necessity, does there appear to have any great change taken place. People's stomachs hold no more, their backs are no broader nor their brains heavier in the last quarter of the nineteenth century than in the first. Of, however, certain sensual and emotional gratifications, whatever ministers to luxury and fastidiousness, or to vanity, curiosity, or excitement, there does appear to have arisen during this time a greatly increased desire.

While the general average of incomes has undergone a considerable increase, that increase has in no wise kept pace with the increase of wants, so that the question of how to make both ends meet is, to the majority of Americans, a more serious one than it has ever been before. Reasons exist for this changed social ideal, as well as for the discrepancy between income and expenditure which has been its result.

With the second half of the present century there began, throughout the free States, a period of material prosperity which, industrially and speculatively, offered, for twenty years, an opportunity of enrichment to all conditions of men such as the world has seldom seen. The extension of steam transportation; the development of manufactures; the discovery of gold in California, and the bountiful product of the West, all together contributed to make the ten years between 1850 and 1860 the most remarkable wealth producing decade known in our history. The ten years following, notwithstanding nearly half of them were noted for destruction of wealth stimulated individual enterprise even more than the ten years before.

Recognizing in the new order of things a great opportunity, and inheriting two centuries of thrift and self-denial, the generation of men now passing away became the most inveterate workers and accumulators that any nation ever produced. Considering the capital upon which they operated, their returns were much greater than business returns at the present time. The foundations of most of our colossal fortunes were laid by men born twenty years before, or twenty years after, the beginning of the century. To the men of that time it was no great effort to withstand those allurements of sense and of imagination which began to attend upon the presence of fortune. They had reached middle life or past it; their habits had been long formed, their pleasures, outside of their business, were few and primitive, and they could not have enjoyed anything else if they would. The sense of possession could destroy in them but a

small measure only of that spirit of abstinence in which they had been bred.

Very different was the school in which were reared their successors. The standard of subsistence had risen. The luxuries of the fathers became the necessities of the sons, who thus acquired manifold desires and a capacity for entertainment heretofore undreamed of. Often receiving polite educations, their energies were distracted from the main chance. Many were unfitted for industrial life by the excitements of army service. Surrounded by an atmosphere of prosperity, getting on in the world appeared, to the men entering action between 1860 and 1880, a very much easier matter than it had been to their fathers. The American of to-day surpasses the American of thirty years ago in the ability to enjoy fortune, as much as the other surpassed him in the ability to obtain and preserve it.

To those influences which had already begun to change our social and economical ideals, was added the inflation of values caused by the unsecured paper currency issued by the national government in 1861. Do but consider the result. The apparent gradual increase to double its former price of every commodity, save interest-bearing securities, and an equal apparent increase in the wages or fees of all professional or personal service. At once began a period of unnatural business activity. Everybody was consumed with a desire to buy and sell, the result being a rush from all other occupations into trade. Young men looked forward to but one career—that of a business life. Town population grew apace; that of the country stood still or went backward; and the government, to perpetuate the good times, forced its citizens to make use of the high priced and inferior wares produced at home by imposing a prohibitive tax upon the better and lower priced articles manufactured abroad. With the expansion of trade came the expansion of credit; never before was borrowing so easy. A man could open a place of business with a stock of goods bought on time, hypothecate his merchandise to speculate at the board of brokers, and sail a yacht or drive a fast horse by payment of enough money to execute a mortgage thereon.

Most demoralizing of all was the growth of a rampant gambling spirit, and the making possible a means of so-called speculation, which is not even worthy the name of a game of chance. The lottery had been declared unlawful because of its dissipating the earnings of the people, but, in comparison with the game by which it was succeeded, the lottery was legitimate business. Its patrons risked only the price of a ticket, and it was win or lose and done with till next time, but marginal speculation is a constant fluctuation between profit and loss; now baiting its votary with success, now drawing upon his resources to preserve his holdings, a perpetual anxiety and distraction from other occupations, with, finally, the

same end as the lottery—only the managers obtain any profit. Few, save its agents, are aware of the extent to which people of every condition seek to increase their incomes by this hazardous resource. Lawyers, clergymen, teachers, legislators, public officials great and small, managers and subordinates of financial and industrial organizations, artists, literary men, and even women and children.

Thus began the "gilded age," the era of imitation, of extravagant ornament, of valuing everything by its money price, and of the idea that something was to be had for nothing. Good taste and the eternal fitness of things underwent as much degeneration as did judgment and principle. Amid such influences is it any wonder that prudence and moderation should, to the new generation, have ceased to be virtues?

Finally the tide turned, and, by a lingering process of ebb and flood, prices shrunk back toward the point of starting. When the reaction culminated in the collapse of 1873, thousands of men in the prime of life found themselves with only nominal occupation, and as many more, accustomed to dealing on their own account, sought employment in some fiduciary capacity among the firms and institutions surviving the wreck, or in those which new capital began presently to organize. These men had been educated in a school ill-fitted to graduate candidates for positions of trust.

With the descendants of the old stock, now began to compete in business the sons of those millions of immigrants who had settled here between 1850 and 1860. These young men, early forced into the world on their own account, had that greatest of all advantages in the obtaining of fortune—no advantage at all. Not averse to the mechanical trades, or to those coarser and more independent occupations which had been deserted by the sons of the native, many of them hoarded their earnings, became capitalists and often directors and employers of those by whom their fathers had been looked upon as an inferior class. It is to be noticed that most of the polite crime of the day is perpetrated by men bearing colonial names. The sons of the foreigner began at the foot of the ladder and worked their way up. The sons of the native, beginning midway, or at the top, have too often fallen headlong, or been slowly working their way downward. There is, as a rule, no chance to which men will not resort in order to maintain that position they have been accustomed to hold among their fellows.

The monopolization of business by corporations or great industrial firms offers more opportunity for dishonesty than when it is distributed among a larger number of active proprietors. An institution managed by a board of directors, or by a private secretary and attorney, is not like one conducted under the eye of a single master who is familiar with its every detail as well as with the personal habits of his associates. It is among the officers

and accountants of manufacturing or banking enterprises that half of this malfeasance happens, whose temptation to hazardous ventures is often the example of their own employers.

Our system of education has been the means of turning many honest fellows into unsatisfactory members of society. Patterned after the ideal of a feudal aristocracy it is, indeed, admirably fitted to make men polite, white-handed, and exclusive, but, unless they are to devote themselves to teaching what they have themselves been taught, it is, so far as concerns material provision, an obstacle rather than an aid. What is called higher education is a luxury, and too often, like every other luxury, enervates men for the business of getting an honest living. To educate, beyond his calibre, a boy who must make his own way in the world is worse than not to educate him at all. The extent to which over-refinement weakens principle, reverses instinct and deadens sympathy, is standing proof of the truth of Thoreau's saying that "there may be an excess of cultivation, as of everything else, until cultivation becomes pathetic." To develop wants in a youth which it is probable he can never gratify, is to add to his temptations, and is to society a curse more often than otherwise.

A certain moral looseness, the legacy of these unsettled years, yet fills the atmosphere of affairs. The success of everyone is measured by material standards. The best business man is he who obtains the largest profit; the best professional man he who receives the largest fee; the best politician he who keeps himself most constantly in office. Society asks of a man not so much concerning what he is, as concerning what he does. Simple honesty, as a qualification for business position, is less regarded than the rapid dispatch of work, the pleasing of influential patrons, or the ability to influence patronage by the applicant himself. Listen to a pair of ancients asking after each other's children, and the inquiry is not whether they are honest, or wise, or brave, or patient, or generous, but are they "making anything." A well won fame, without accompanying fortune, is a dangerous possession, so great is the temptation to make business capital of it. The social standard has been raised so high that men's energies must be devoted almost wholly to the obtaining of a subsistence. The burden of our politicians is of how rich we are, and of how much more rich we shall be twenty years hence. If honor among us has not been reduced to the Falstaffian estimate, those positions in which it is the main wage often go begging for fit occupants.

The ideal citizen of our republic needs a power of adaptation and an integrity almost superhuman. He must be, at the same time, a gentleman and a drudge; a student and a man of business; accumulative as well as public spirited; honest as well as enterprising. No labor of the old demigods was equal to his. No medieval saint

had so many temptations to resist as he. The terms are too hard for most of us in these alluring times. We set out with high resolves, strive for a while, then rush wherever circumstance impels us, and, as Emerson says: "do what we must and call it by the best name." Verily, men and brethren, if our offenses have been great, our temptations have been also great.

The lives of most men are merely adaptations to the spirit of their age. Our time has, beyond any other of which we have record, developed a universal appetite for whatever ministers to the pleasures of sense and the pride of life. Men pray every day to be delivered from temptation and rise from their knees to go immediately in quest of it. We are like children spending their holiday pittance in a candy shop, anxious to have as many of the goodies as possible and obliged, therefore, to be content with a taste of each. But "this or that, not this and that, is the rule to which all of us must submit." We may possess nothing desirable without giving something of value in return. There is, however, this never to be forgotten difference between a valuable quality and a valuable material possession; we may obtain a rare commodity, or the means of commanding it, by the effort of others, but the effort which obtains a valuable quality can never be any other than our own. We must pay dear for every luxury, and dearest of all for the luxury of being an honest man.

IS THE CHURCH WORTH SAVING?

BY LEWIS G. JANES.

The query, "Is the church worth saving?" is so often repeated, not only by those who are avowedly hostile to the claims of supernatural religion and organized Christianity, but by many who still maintain a formal connection with one or another of the Christian sects, that it merits the thoughtful consideration of every liberal and progressive thinker. It is urged, on the one hand, that the method of the church is theological and unprogressive; that it fails to grapple energetically with the living questions of the time; that it spends its force and capital drawn from the hard earnings of the people in sustaining "creeds outworn;" in prating about the affairs of another world, instead of striving for the betterment and salvation of man in this world. A thoughtful and candid writer—Professor William Graham, of Queen's College, Belfast, in his latest work, *The Social Problem*, repeats in even more emphatic language the indictment of the Christian church which he presented some years ago in his *Creed of Science*. "The old function, discharged by our old spiritual guides," he says, "is palpably, in the eyes of all thinking men, doomed; it is dying, unless it can transform and readapt itself to the spiritual and moral and social wants of the new time—a thing nearly impossible, as history shows, and rather to be hoped for than expected." The complaint of Emerson that we are

“preached at” too much, receives the practical indorsement of multitudes of our leaders in thought, of our scientists, philosophers and educators, who join the greater multitude of the careless and indifferent in absenting themselves from all regular attendance upon the services of the church. The fear of hell and the coercive power of secular authority being removed, many withdraw all support from organized religious institutions, and many more retain a connection with them which is purely conventional and formal, conscious of a total want of sympathy with the doctrine, ritual and service which they countenance by their presence, and pecuniary aid. “I have no heart in it,” said an intelligent young lawyer and college graduate to me the other day. “I am not instructed or morally inspired by the sermons. I do not believe the doctrine. It is all a bore. I am kept in the church simply by my family connections and associations. I attend service to avoid giving offense to my friends.”

The enormous untaxed properties of the churches are a standing menace to the principle of religious liberty on which our government was founded. The plea that the church is a guardian of the peace of society, a conservator of public morals, which is urged in support of the exemption of religious properties from taxation, has very little force in the minds of thoughtful people. An institution which requires this government “protection,” which admits itself a pauper, and even joins in a shameless scramble for a share of the public moneys for the support of its sectarian charities, does not stand in a position to become a forceful teacher of righteousness—a rebuker of wrong in high places—a defender of the poor and oppressed against the power and wiles of the oppressor. The morality of the pulpit is conventional and emasculated. It declaims against Mormonism in Utah, organizes societies to convert the Jews, launches its thunderbolts occasionally against Agnosticism or the fatal errors of some rival sect, but touches the sins of its own pews with gloved hands, and fears to grapple with the pressing social evils of the time. Its newest gospel is two thousand years old. It speaks the language of a forgotten age. It leaves the heart out of the teaching of Jesus, while it wrangles about the form of his doctrine and the “mint, anise and cumin” of ritual and phrase.

Such is the indictment, we may almost say the popular indictment, against the church to-day in England and America. Such, doubtless, is the feeling of a vast number of liberal and progressive thinkers, not all of whom have had the courage of their opinions, it is true, but who, nevertheless, are at heart, in general agreement as to the character and utility of the ordinary pulpit teaching. Many do not hesitate to avow that the clergy are “lost leaders,” time-servers, pew-panderers; that the church, as an institution, has had its day, and should give way to other agencies for ethical instruction and social regeneration. In answer to this indictment, it is urged, even by

some who have no belief in the popular creeds, that the church is nevertheless useful to society. It has a certain value as a cement to the social organism. It keeps people conventionally good. It creates a circle of public opinion within the larger circles of society, which helps to hold men to a formal allegiance to social law and order. It is an aid to the police. Its fear of hell, so far as it is still a vital belief, helps to make men do right. There are many who, like the popular clergyman, would “have their fling” if it were not for the dread uncertainty of the after-life, and such as these are kept in order by the church.

What shall the thoughtful student, anxious to conserve all that is good in present institutions, believing in social evolution rather than in revolution, strenuous in defense of public and personal morality, earnest in search for a solution of the pressing problems of our time, answer to this question, “Is the church worth saving?” If it is to continue to follow the old conventional standards, I think he must answer that it is not worth saving; that the sooner it gives place to the Ethical Society, or to some other active and modernized agency for social and individual improvement, the better. If the church is to fight on under the old flags, organized religion will become more and more organized hypocrisy. For the Mrs. Partingtons of the pulpit cannot stay the tide of modern, progressive thought; cannot turn back the advancing columns of scientific discovery, or break the irresistible logic of rational philosophy based upon the facts of experience. They cannot meet the cry of the starving poor, the demand of the manual laborer for a larger share of the product of his labor, the universal aspiration of all thinking men and women for a higher education and larger liberty, by an aptly quoted text of “sacred Scripture,” a doctrinal sermon, or the sensuous æstheticism of sacred music and ritual. The multitudinous charities of the church—and I gladly recognize their number and their value—cannot cover the greater multitude of its sins against sincerity, reason, and the noble striving to make pauperism impossible by removing its causes. It cannot atone for its neglect to educate and help men for nobler living here, by all its doubtful information in regard to that unknown land beyond “the bourne from whence no traveler returns.” Nor can the coward’s plea that it is “safer” to yield a conventional assent to the dogmas of the popular religion, long continue to hold manly men and womanly women to the service and support of the church. The judgment of the intelligent, independent thinker is sure, ultimately, to become the judgment of the masses of the people. This is a utilitarian age, but it is also an ideal age, seeking ever for the highest uses of things; and the church will be judged, and if need be condemned, by the standard of the higher utilities;—not by the question whether or not it serves as a convenient adjunct to our police

system. The church must be something better than a coward's castle if it would escape the fate of becoming a picturesque ruin at no very distant day.

Is there, then, no hope that the church, regenerating itself, may again become a regenerator of mankind? I believe that there is some hope that it will renew its usefulness, put on the garment of reason, learn to speak the language of to-day, and render to man the service which he demands in return for his allegiance and support. I find it in the pulpit utterances of such men as Phillips Brooks, and Heber Newton, and Charles R. Baker and Bishop Potter, in the Episcopal church; Minot J. Savage, John W. Chadwick, William C. Gannett and others, in the Unitarian church; Washington Gladden and Lyman Abbott in the Congregational church, and others in different branches of the "Church Universal." I find it in the growing tendency to rationalize the ancient creeds by transforming them into the likeness of modern scientific and philosophical thought, as was attempted by Henry Ward Beecher in his latest discourses, and notably at an earlier date by Minot J. Savage. I find it in the increasing attention which the pulpit and religious press are paying to the social problems of our time—to the establishment of the kingdom of heaven on earth.

Let us hope that these tendencies may continue—that the church will prove itself worth saving, and be saved to become the helper and savior of man. Myself a firm believer in personal continuance, I would have its waning hope renewed by a deepening consciousness of the worth and beauty of our daily life—as it can never be by futile appeals to Scripture texts, or the alleged miracle of Jesus' resurrection. *Fulness of life*, in the individual and in the social organism—this should be the object of our striving,—the high goal of our ambition. That the church may serve us in promoting this noble end, let us hope that it also will be endowed with a larger and fuller life—that it will take hold upon the vital questions of the day, and treat them in the light of the loftiest ethical ideals,—that it will assimilate the teachings of modern science, and impart their practical conclusions to the people, for the sanitary improvement of society;—that the thoughts of the pulpit may become more rational and hopeful and helpful, its teaching more honest and sincere. Let us hope that the church edifice will be honestly taxed, and opened not merely for two or three hours on a single day of the week, but that every day some helpful word of scientific, sociological or religious truth may be spoken there, to which those who most need and desire it may be freely invited. Let each church have its library and reading-room open at certain hours in every day and evening, its lecture-room for debate and discussion, its parlors for social reunion. Let it teach the gospel of science, the gospel of justice, the gospel of honest dealing and fair play. Let it become an arbitrator between the capitalist and the laborer, a

uniter of society into more fraternal relationships, a common ground on which the different social classes may meet, amicably discuss and justly settle disputed questions. Let it welcome honest thought and free discussion. So doing, it will prove its right to be, and thoughtful men and women will adjudge it worth the saving. To quote again, and finally, from Professor Graham:

"As to the church, there is perhaps one chance left for her, one course open, by accepting which she might * * * recover in large measure her hold on the lapsed masses of labor, might even, for a considerable time yet, discharge a real function required in our time in return for her pay. * * * Let her become the church of the people; become a militant church, fighting the cause of the poor, the needy and the oppressed; become what she originally was in large part, and the tradition of which she has never wholly lost. * * * Let her now take to works, instead of expatiating on faith, its mysteries and its efficacies,—to the work that Christ had at heart, and all the true prophets had at heart—to hasten the kingdom of heaven, to bring in the reign of righteousness, which means and ever meant a *régime* of social justice, in which the sovereign of whatever kind 'shall reign and prosper, and execute judgment and righteousness on the earth!'" So doing, she may at least be worthy of salvation, which is better, even, than "being saved."

REFORM PROBLEMS.

BY FELIX L. OSWALD.

It is not probable that the Bible of the future will find much room for ghost-stories. A salvation-needing world is losing its faith in *post mortem* Utopias, and temporal existence has proved too evidently susceptible of improvement to leave the dogma of renunciation a chance to repress the incipient struggle for the recovery of paradise on this side of the grave. And moreover, the suspicion is gaining ground that the success of that struggle has been retarded chiefly by the very doctrine that promised to achieve the redemption of mankind by diverting their attention from earth to ghost-land. When the siege guns of Mohammed the Second were battering the walls of Constantinople, the citizens are said to have crowded the hall of a lyceum, where a couple of shrieking monks were threshing the wind of theological controversies; and metaphysics of that sort have unfortunately not been confined to the capital of the Byzantine Empire. While the neglected fields of our earth were fading from gardens into desert, we have waged fierce wars for the enforcement of senseless ceremonies and the interpretation of vapid rant about the mysteries of Cloud-cuckoo-town; but the result of that pursuit has finally opened the eyes of the spectre-hunters. They have at last rediscovered the truth that life can be made worth living, and the era of world-renunciation will be followed by an era of world repairs.

In the evolution of ethics exigencies become duties; and though many dogmas of the departing creed can be traced only to the wants of the priesthood, several tenets of the coming religion can be safely predicted from the secular needs of mankind. The moralists of the future, in demonstrating the insanities of "other-worldliness," could hardly choose a more striking instance than the thousand years' blindness to the consequence of *forest destruction*. The devastation of the woodlands which once covered the Eastern continent from the Himalayas to the Atlantic, has, in the literal sense, blighted our earthly paradise by reducing the habitable area of our globe from four-fifths to less than two-thirds of the total land surface; and there is no doubt that one-half of the devastated territory once constituted the most favored region of this planet. Forest destruction has turned garden into sand-wastes. It has turned mountain pastures into naked rocks and choked the estuaries of once navigable rivers with accumulations of detritus and pestilential diluvium. It has caused the failure of millions of springs, it has aggravated the severity of summer droughts, and the destructiveness of winter floods. It has depopulated the uplands of the Mediterranean shore regions; it has made the lowlands dependent on irrigation, and diminished the possibility of that expedient from year to year. In western Asia, northern Africa and southern Europe an aggregate of five million square miles has been wasted to the degree where the produce of tillage ceases to repay the toil of the husbandman; and, considering the climatic extremes of the Western continent, its bleak northlands and arid central plateaux, it might seem doubtful if the discovery of Columbus has even temporarily offset the results of neglecting the Eastern garden-home of the human race. The arable territory of the New World will soon be taxed to its utmost capacity of productiveness, and before the middle of the twentieth century the protection of the remaining woodlands will for millions become a question of self-protection. The forests of the uplands will once more become sacred groves; philanthropists will cover our worn-out fields with tree plantations, the culture of forest trees will claim a portion of the scientific efforts now directed towards the invention of tree-destroying machinery. Wars, even wars of rapine, will probably continue to the end of time, but their havoc will be partly offset by the nobler struggle of reconquering land from the desert.

The long neglect of physical education will likewise be retrieved by the dissemination of clearer views on the conditions of earthly happiness. The idea that the soul must, or can, be benefitted by the abasement of its material medium, will rank next to the witch-craft insanity as the most pernicious delusion of the Middle Ages, and the pagan ideal of a sound mind in a sound body will once more become the ideal of the civilized

world. The awakening of mankind from the fever-dream of the monastic era, and the consequent revival of science and freedom, has, indeed, been defined as a "war of insurrection against the anti-physical principle," and that revolt will not long be confined to the formulation of new theories and political constitutions. The civilization of the future will build a gymnasium with every school. Manly sports will no longer be held below the dignity of a well-bred citizen, and even the adherents of hyper-physical dogmas will admit that the possessor of an immaterial soul cannot afford to neglect his material self any more than an artisan can afford to neglect his tools.

The temperance movement has already passed the repressible stage. The knowledge that a man *can* be defiled by things that enter his mouth, has been bought at a price which the world cannot afford to pay a second time, and the opponents of spiritual and spirituous poisons will soon work hand in hand. Nor is it likely that the war upon the poison vice will be confined to the proscription of the alcohol habit. "The historians of a coming civilization," says a French sanitarian, will probably hesitate to credit the moral cowardice of an age that could submit to the outrages of the obtrusive vice that poisons the life-air of public promenades and pleasure resorts,—with the insolence of the Slavonian toppers, mentioned by the traveler Busbequius, who saw two citizens of Bucharest lay hold of a stranger, and by actual violence, force him to partake of their nauseous beverages. A public lung-poisoning tobacco smoker will be suppressed more promptly than a self-poisoning rum drinker, by just as much as an embezzler of public funds is held more guilty than a self-damaging spendthrift." But that even the approximate suppression of the alcohol-vice alone, would be an infinite blessing to the cause of all other reforms is so certain that the objection on the score of an alleged infringement of personal liberty can, by comparison, claim no weight of influence whatever. The dram-drinker, it is true, acts of his own free will, and cannot often charge the encompasser of his ruin either with violence or the employment of seductive false pretences, but the same argument would license brothels and gambling-hells, and the manufacture of obscene literature. The arguments of political economy have already begun to preponderate on the side of prohibition, and moreover, the permanent interests of public welfare will always be procured at the temporary expense of fiscal emoluments. When the salvation of mankind appeared to require the expulsion of the Moorish infidels, the prospective loss of revenue by the exile of the most industrious citizens did not prevent the impecunious Spanish Government from issuing the decree of banishment, and the ruinous foes of industry will in vain plead the importance of a tax representing but a trifling percentage of the yearly drain upon the

resources of rum-drinking nations. Judge Pitman is probably right, that the Maine Law is destined to become a main law of every civilized commonwealth.

But the victory of temperance need not be purchased by the sacrifice of our recreation-days. The history of asceticism has proved again and again that the suppression of harmless amusements is a direct cause of vicious excesses; and total abstinence from intoxicating drinks would be promoted, rather than prevented, by the freedom of all healthful recreations on the day when a large plurality of our workmen find their only chance of leisure. The tyranny of our Puritan Sabbath is, indeed, the ugliest survival of the age that blighted the sunshine of life by the joy-hating dogmas of anti-naturalism, and in the United States the disadvantages of promiscuous immigration have been greatly compensated by the continuous influx of the representatives of civilizations that have succeeded in emancipating themselves from the curse of that tyranny. The law, making the wanton disturbance of public worship a misdemeanor, should certainly be enforced in favor of Buddhists and Hebrews, as well as of the most fashionable Christian churches, but the law of equity should likewise protect every dissenter in the right to pass his Sundays according to his own predilection, in any way not violating either the maxims of natural morals nor the equal privilege of any fellow-citizen. A community of Health-worshippers would have an undoubted right to devote their leisure day to outdoor exercises, conducted under the special protection of the State; but their peculiar institution would at once become rank tyranny if they should force a Methodist guest of their commonwealth to suspend his devotion and join in their foot-races; and for the same reason a disciple of Nature has a right to demand the abolition of a law raging with proscriptive penalties against the visitors of a Sunday festival in the health-giving highlands, or imprisoning ball-playing children, in order to satisfy the clamors of a bigot who prefers to pass his Sundays in an atmosphere sickened with meeting-house smells and nasal cant.

The revision of the prevalent theories on the proper sphere of legislation will sooner or later be sure to remove the obstructions to the freedom of international commerce. The resisting power of established abuses has its limits, and nothing short of illimited obstinacy of prejudice could in the long run resist the logic of the arguments against the fallacy of legislative interference with the natural laws of trade and industry. "The proper significance of such problems," says Professor Kessner, "becomes much clearer by divesting the controversy of its veil of technical phrases. The logic of political economy, applied to the problem of international traffic, is simply this: The opponents of free trade propose to increase the resources of national wealth. In pursuit of that object they prevent brother

Hans from buying a cheap and good coat from foreigner Frank, thus compelling Hans to buy an ill made and expensive coat from brother Tom. But what the nation gains by Tom's profit is exactly balanced by Hans' loss, and the result of the experiment will amount to nothing; but the removal of money from our fob to our breech-pocket, if it were not for a third factor: The pay of the hired bullies, who have forced Hans to relinquish his hope of a private trade with Frank. By exactly the amount of that pay the net result of the transaction leaves us poorer."

The fallacies of the Protectionists may in some respects have encouraged the illusions of Socialism and the clamors for the continual interference of a paternal government; but considerations of health, as well as of simple humanity, should certainly advocate the enforcement of an Eight Hour Law, and a still more needed law against the employment of young children in the soul and body stunting drudgery of factory work. There is a story of an Arab chieftain who had been half persuaded to prepare his tribe for the blessings of modern civilization, when his mentor happened to enter the workshop of a Marseilles cotton spinners. At sight of the dust-clouded atmosphere and the crowd of pale faced children tending the whirling spools the chief stared and followed his guide in pensive silence. "Are those young criminals?" he inquired, when they left the building. "Oh, no," exclaimed the guide, "they are honest boys, working for wages to assist their poor parents." "Look here," said the Arab, pointing to the gilded dome of a neighboring church, "if that were gold and you offered us a treasure-pile of that size, the poorest man of my tribe would refuse to sell his children into the hell of such slavery." According to nearly concurrent estimates of British and German statistics, from eighteen to twenty-two million young children of the industrial nations are at present inhaling the seeds of premature death in lead-works and textile factories, etc. "Our poverty, but not our will consents;" but in a wholesome state of social conditions poverty should excuse almost anything sooner than an habitual sacrifice of health.

The most valid argument against the projects of communism is perhaps the objection that the realization of such schemes would cripple enterprise by removing the stimulus of personal interest, while on the other hand a community of property would certainly remove many grievous burdens of civilized life. Bakunin, the "Russian Mirabeau," seems first to have devised a combination of those advantages. Without any by-plans against the tenure of personal property, he proposed to found communities on the plan of reserving sections of public land for the benefit of each township, and thus obviate the necessity of direct taxation, by letting the rent cover the entire budget of municipal expenses. As those expenses multiplied, the value of the reserve lots

would increase in proportion, and could be advanced even with the result of a surplus for charitable purposes, by renewing the rent contracts from ten to ten years. The plan seems an improvement on the confiscation project by just as much as prevention is better than cure, and will probably form the practical outcome of a recent reform movement which has already ceased to imply the menace of an agrarian revolt.

CONSCIOUSNESS.

BY E. P. POWELL.

There is no word so played fast and loose with as consciousness. It is most often used to designate a super-sensual sort of knowledge; a direct and necessary knowledge. A man is conscious of certain facts, and that ends all possible discussion. Again, consciousness is used in a somewhat vague way to cover that immaterial element in life which is not covered by matter and force. The theistic or spiritualistic conception of organic life denies that it is possible to exclude from the proposition "a living thing," the term consciousness. Cope says: "Consciousness is an attribute of matter," and again, "Consciousness is a condition of matter in some peculiar state, and wherever that peculiar state of matter exists consciousness will be found." Huxley asserts consciousness to be "a function of the brain;" again, "Consciousness is a function of matter;" again he says, "I understand the main tenet of materialism to be that there is nothing in the universe but matter and force, and that all the phenomena of nature are explicable by deduction from the properties assignable to these two primitive factors. But all this I heartily disbelieve; it seems to me pretty plain that there is a third thing in the universe, to-wit, consciousness; which, in the hardness of my heart, or head, I cannot see to be matter or force."

Sir William Hamilton says: "Consciousness is a recognition by the mind of its acts and affections; the self-affirmation that certain modifications are known by me and are mine." This is a definition of self-consciousness; a recognition of that group of phenomena called self or ego. And it is no wonder that Hamilton adds, "Consciousness cannot be defined." He does not—neither does any other philosopher, apart from the evolution school—fail to confuse himself with this word. It required, first of all, that evolution should afford us a history of life and its contents, before these contents could be comprehended. Consciousness is an evolution and, therefore, has a history. This Cope recognizes and gets at the very pith of the matter when he sums up the doctrines of consciousness thus:

1. Consciousness independent of matter—Dualism.
2. Consciousness an attribute of matter—Monism.
3. Consciousness (*a*), primitive and the cause of evolution.
4. Consciousness (*b*), a product of the evolution of matter and force."

Nevertheless he leaves a confusion in the word, although he defines the thing so admirably. In his view Monism (*a*), or No. 3, is the correct view of the universe; and consciousness does truly lie, as the very cause and momentum of evolution. I have no doubt this is the drift of true science and scientific metaphysics—a drift to be sharply defined in due time. All the more it becomes necessary to place the word consciousness on its historic basis; we shall then neither confuse ourselves nor others with dualistic concepts.

In the first place we cannot escape going back to the primordial conditions of life, cellular and pre-cellular, to inquire once more as to the very nature of this something which Cope and Huxley and, I believe, our ablest biologists altogether, agree is surely there. What is there before evolution has altered or complicated it? We may easily agree as to matter and force, although we may be puzzled after all to tell what force and matter are.

But as to the third factor, is it really consciousness, or is it something from which consciousness is a derivative? If we can agree to call the general faculty based on sensation *sentience* we shall at least be philologically correct, and logically. Con-sentience will, therefore, be the state of comparative sentience; and consentience, or consciousness, becomes defined as a comparative functioning of primitive sentience; for it stands evident that this sentience which we never can get below and back of, however low down we go in our research, and which is a quality of all living protoplasm, inseparable from life, and is manifested at first in desire or hunger, soon must become a comparative power. The amœba eats what it touches; but if the amœba does not manifest choice of foods, creatures a little higher do. This involves a comparison of sensations and in its nature is no longer simple sentience, but con-sentience, or con-consciousness. And it will not hurt our grapple with the word that we can now use it in the philological sense; that is, to know things together, or in a group.

Consciousness, then, is a higher condition of sentience; and as such it extends in higher degrees of manifestation, through all the evolution of organic being. In man, and nowhere but in man, the subject becomes also object, and consciousness becomes self-consciousness. The animal knows, but does not know himself, neither abstract being. In other words, the dog knows, but does not know that it is himself that knows. I think the same may be equally averred of the primitive anthropoid, and as well also of the lower savage races. Certainly self-consciousness belongs to no creature before man. By cosmical research man, enlightened, reaches the ideas infinite and eternal; and his consciousness becomes an apprehension of eternal and infinite being, or, to retain the word with which we began, he is conscious of self-higher-than-himself.

Let us go back and follow the idea analytically. Sentience is a necessary and direct knowledge or apprehension of not-self by the mode of sensation. Consciousness is comparative knowledge of things constituting environment. Self-consciousness is comparative knowledge that becomes so largely synthetic that it not only groups our sensations in comparison, but groups that and those which constitute self as distinct from non-self. Consciousness of self-higher-than-ourselves is the rising power to group all phenomena of not-self into a unity in its relation to our-self. This is the end of evolution of sentience; for it has grappled with eternal and necessary self.

But what then is the unconscious? It is even more important that we should have a clear apprehension of this term; for no one can fail to see that "the philosophy of the unconscious" of Hartmann and the use of the word by others, is largely confusing. Unconsciousness is clearly that state of consciousness which arises when functioning in any direction becomes automatic, or instinctive. Our hearts beat and our nutrition goes on without our conscious attention; although nutrition in lower life and the functioning of the heart are highly conscious operations under the direct control of the will. Nature, having perfected any function, pays no more conscious attention to it, and it becomes henceforth an unconscious functioning. The bee and ant are almost entirely automatons, yet with a trace of consciousness. As the vegetable kingdom and the animal originated from a common sentient life, it follows that the vegetable kingdom must be considered as a wholly automatic or lapsed order of life-processes. It has wholly passed over to the unconscious.

Now this unconsciousness is wholly different, as one can see, from the pre-consciousness which is the state of the universe before or preceding organic life. Unconsciousness is that state of consciousness which exists when tentative action has become fixed and established action—when functioning has become automatic. The evident tendency of all conscious action is thus to pass on to organic rhythm. Our intellectual and moral choices, in like manner, tend toward habits that no longer require choice or will, and so lose the quality moral or intellectual. The love that a mother bears for her babe is a matter of instinct and not of morals; whereas the love that is exercised by a philanthropist for the oppressed and despised may require a very high degree of conscious will. The mother is conscious that she loves, but is not conscious of any process of choosing to love. Herbert Spencer points to the time when all moral power will be exercised without choice between good and evil; but the good man will do the good because it is his nature to do it.

However, I have no desire to discuss the unconscious farther than to make my definition clear. Sentience I

would make the primordial elementary quality;—that something besides matter and force, which Huxley declares he cannot escape. This becomes, in complex life functioning, a complex and yet ever present constitutive element. Whatever its evolution, or the evolution of matter and force, these three are essential to the idea organic life. They are fundamental qualities, and therefore belong to, and are inherent in, the universe. It must be borne in mind that the organic universe is by no means a derivative of the inorganic any more than the animal kingdom is an evolution of the vegetable. The two kingdoms, animal and vegetable, are diverging processes of a precedent life, that was neither one nor the other. So organic and inorganic are diverging, and yet mutually interactive processes of the universe. The inorganic does not contain sentience, the organic does. You cannot get out of the inorganic what it has not. The death of an organism is a passage of by no means the whole being into the inorganic. It is a yielding of only those parts that are constitutive in the inorganic. What becomes of sentience, consciousness or self-consciousness? This opens the question of all questions most fascinating and important, and must be discussed, if at all, in a succeeding article. My object for the present is attained, by aiding to establish some degree of accuracy in the use of terms, which are often used recklessly, and, for valuable results, used in vain. The historical view of consciousness may be tabulated for convenience thus:

Presentience — The attribute of the universe.

Sentience — The attribute of living substance.

Consciousness — The result of choice in sentient beings.

Self-consciousness — A conscious synthesis of that which makes up ego.

Consciousness of self-higher-than-ourselves; — A conscious synthesis of all that which is not self, an infinite.

CHATS WITH A CHIMPANZEE.

BY MONCURE D. CONWAY.

Part II.

In the interview about to be reported I do not aspire to overmuch realism. To describe the processes, whether phonetic, facial or other, through which my anthropoid friend and I interchanged ideas might divert attention from the ideas themselves. I do not wish to raise a host of wrangling philologists, skeptics, commentators, to dispute whether I did or did not mistake the Chimpanzee's meaning, or whether he meant this or that. What I gathered from the interview, not how it was gathered, it will be my aim to state.

"A large number of curious visitors have come to our temple," said the Chimpanzee; "they have amused themselves by watching us as we ate their sweetmeats, and looked on us as nature's jokes; but I have been

interested by observing in you a certain respect, as if you were not merely condescending to notice your inferiors."

"To respect, add admiration," I said. "I have long ago found the truth of what a wise German, Oersted, said, that monkeys appear grotesque or ugly to mankind only because generally seen out of their place, tricked out by showmen, away from their right environment. They are beautiful in their place. I have seen them at play in the luxuriant woods, making the forest animate with their graceful swinging from limb to limb; nothing more fascinating have I ever seen. To-day I have been surprised to find that your race can be no less charming amid walls reared by the hand of man."

"The walls being partly adopted and retouched by nature, the blue sky bending over us; and, possibly, because our contrast with these ash-smear'd devotees is not so favorable to them as if we were displayed among merry and well-dressed human companies."

"Perhaps."

"But I must now add another thing. We who inhabit this temple are not ordinary monkeys. There are two kinds of monkeys—arrested monkeys and reversionary monkeys. Have you heard of a man named Haeckel?"

"I am just reading his account of a sojourn in Ceylon and India."

"Recently while he was here, I heard the priest you saw just now and another conversing about a murder he committed—so they called his shooting a monkey for his museum. From what they said I think it must have been (though they knew nothing of that) not only a reversionary monkey, but a transitional one—like myself—what he may have supposed a "missing link," but really one from which, had he approached it with sweetmeat communion instead of a gun, he might have learned more about evolution than he will get from a million dissected or stuffed anthropoids. But he was only a man, and knew not what he did."

"Tell me, I pray you, the difference between the arrested and the reversionary ape?"

"The fruit of knowledge grows in the vale of humility. You are willing to sit at my feet though you must know that your form is more erect, your flesh fairer, your powers more various than mine. But look over to that farthest court, and tell me what you see?"

"I see six haggard men, naked, smeared with ashes, sitting motionless before six smoking logs of wood. I see near them on the ground two ash-covered human heads, belonging to bodies buried to the neck. I see a man before the altar of a horrible image holding a pretty little kid's neck under a blade—it falls! The blood spurts! It is sickening."

"Now look around you in this court—what do you see?"

"A group of monkeys at play, others slumbering in the sunshine, others quietly seated together, or caressing each other; and all surrounded by beautifully carved symbols of nature and poetic legends."

"If you were compelled to choose which you would be, permanently, not with a view to change or reform, but for life—one of those half-buried, butchering or forever motionless fakirs—or one of those merry monkeys?"

"I should unhesitatingly choose the monkey's lot."

"Then you would be an example of reversion. That is what we are—reversionary monkeys. We are descended from a race of philosophers, who, having climbed to be men found their lot intolerable and deliberately developed themselves, not into the original type, but into a similar one which should avoid certain disadvantages of the arrested form—the monkey that never was (and now never can be) man."

"How stupid I am! Only this morning, examining certain repulsive idols and meditating on the rites witnessed around them, I thought it a happy discovery, and meant to suggest it to Haeckel, that all this 'religion' originated with monkeys. And now I find that monkeys are the dissenters who renounced such inhuman humanity."

"Do not credit our race with martyrdom. It was all the work of evolution, though not by natural selection. It was by human selection. It is much more comfortable to be worshipped than to worship, to be sacrificed to than to sacrifice."

"Will you please tell me more of this great odyssey, this pilgrimage of your race to humanity, and to—what shall I say? a plane beyond or below it?"

"That depends on your standard of high and low. Have you ever changed your faith?"

"Yes; I was once a Methodist; then a Unitarian Christian; then a —"

"That will do for my purpose. When you were a Methodist your god was the stream of tendency that makes for Methodism; whatever helped that was good and fair; your ideal was a world converted to Methodism. That faith abandoned, your divine stream makes against Methodism; a Methodist world were the reverse of ideal. So with your discredited Unitarianism. So long as the human form is your standard of perfection you cannot have any other ideal."

"I confess it appears to me scientifically demonstrable that the human is the supreme form."

"So, it seems, you once thought Methodism among forms of religion. I have already admitted the superiority of the human powers. But superior for what? Is the purpose for which each creature's best has been selected and combined in one form a good or a bad one? If it be a contrivance for misery, then like the next most perfect combination in nature, the serpent, the evil is commensurate with the perfection. Take another look

at our fakirs over there, and see what they are empowered to do with their admirable joints, hands and senses. We monkeys of the temple have powers adapted to happiness and harmlessness in our friendly community; we have not imagination enough to see the supernatural terrors which paralyze those poor men; our hands are not skillful enough to kill kids. As for beauty, that is relative; handsome is as handsome does. To one starving an oyster is lovelier than its pearl. Our morphological inferiorities correspond with advantages. Our resemblance to men suggests to them that we are their shrunken ancestors, and they serve us. Our silence prevents their discovery of our ignorance. We belong to their adorable realm of mystery. Thus they become our liveried ministers, while gaining support by that service—the humanest, in your sense, in Benares. Freed from the struggle for existence, we can fraternize. We toil not, nor spin, yet we are fed and clothed. We are not anxious for the morrow. We are not ambitious to get ahead of one another. There is more than enough sunshine and sweetmeats for all. None have to regret our existence.”

“But you die like men? You must grieve for loss of your children, your wives, your friends?”

“Your remark touches an important matter. Let me explain what I meant just now by describing myself as a transitional monkey. I have not yet been able to evolve so far as those around me. Of all here I alone still bear some lingering burdens of humanity. I have, for instance, this power to converse. It is my loss and your gain. The dwellers in this court escape the sting of death, which is apprehension. They have no torturing consciousness of its approach, still less any horror, hereditary or other, of dangers beyond it. In the absence of strife, of wakeful ambition, of envy, of asceticism, of conventional morals hostile to nature, we never know disease; we never die but once. When one dies of old age the regret of survivors is not agony. As proof I may say that though, individually, I am a link between these and humanity, my hope and aspiration lie in their direction, not in that of these care-ridden, terrorized people of Benares. Of your own foreign race I cannot speak. Your people, perhaps, are free from fear, from competition, from anxiety about the future or sleepless speculation about the unknowable. To me have been transmitted traditions of such torments which led our ancestors to undertake their journey to Nirvana.”

“I cannot say that my distant people are free from such pains, fears, speculations. But you speak of Nirvana; that is the goal to which Buddha pointed the way.”

“It is. It was while listening to him in the Deer Park over there that our ancestors resolved to seek Nirvana. That, they found, involved escape from the

human consciousness—that is, perpetual morbid introspection of a selfhood made up of fictitious conceptions. What Buddha revealed to those who heeded, was that they lived, moved, had their being, in a fictitious universe; they were organisms created by phantasms incarnate in priestcraft, made potent by superstition; their consciousness was of virtues that were sins, and of sins that were virtues. Non-existent gods shed desolating forces; marriage, industry, birth, endlessly accumulated a chaos and called it order. This chaos, reflected in every mind and heart, made that torture-rack called consciousness. Because phantasmal gods had made existence a hell, the blessed Buddha cried, ‘Escape from existence; enter into Nirvana!’ This obviously could not be done by suicide; for there would necessarily be a survival of the non-suicidal. Nature, indifferent to the sufferings of men, is resolved that their race shall continue. But our philosophic fathers saw that the great evil was this diseased consciousness. Of that they—in their time and place—could only be rid by laying aside, bit by bit, the mechanism of consciousness—the so exquisitely contrived engine of torture—and their artistic evolution through 2,500 years marks the distance between yon naked fakirs killing kids, burying their bodies, or paralyzing them by disuse, and those merry monkeys dancing amid the flowers.”

Just here the Brahman appeared, and bowed low to the ground. I understood; and exchanging with my Chimpanzee an engagement for the morrow—quite inaudibly to the priest—took my departure.

The Chicago Society for Ethical Culture held its annual meeting on Friday night last, and encouraging reports were made of the Society’s progress. Had there been no deficit at the beginning of the year, the society would have been able to meet its entire current expenses and have a balance of \$170 in the treasury. Comparative statements were made showing the growth of the society in numbers and financial resources from the beginning, which was a little over four years ago. Especially gratifying was the report of the publication committee, showing a wide and large demand from all parts of the country for the published lectures. Another woman was added to the Board of Trustees, in addition to the two elected a year ago. The meeting was held in the Society’s cozy rooms at 45 Randolph street, and there was a gratifying attendance. The next number of THE OPEN COURT will contain some account of the celebration of the fourth anniversary of the Society, which occurred on Sunday last. Mr. Salter and his supporters are doing a noble work worthy of all encouragement.

“Herbert Spencer as a Thinker” will be the subject of an article by Prof. Richard A. Proctor in the next issue of THE OPEN COURT.

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixon Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of THE OPEN COURT is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to THE OPEN COURT should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, APRIL 14, 1887.

VICIOUS JOURNALISM.

In one of his recent poems, "Fust and his Friends," Browning represents the discoverer of the art of printing, as at first exultantly crying ament that discovery:

"Go, run
Thy race now, Fust's child! High, O printing, and holy
Thy mission!"

But anon, makes him doubtfully question:

"Have I brought Man advantage, or hatched—so to speak—a
Strange serpent, no cygnet? 'Tis this I debate."

And again:

"Through me does print furnish truth wings? The same aids
Cause falsehood to range just as widely. What raids
On a region undreamed of, does printing enable
Truth's foe to effect! Printed leases and lies
May speed to the world's furthest corner—gross fable
No less than pure fact—to impede, neutralize,
Abolish God's gift and man's gain!"

No words can too highly overrate the mission of Fust's great discovery. "The art preservative of all arts" remains still one of man's most splendid achievements, the key to all knowledge and all good. And of

the many knowledge-spreading methods to which the art has given birth none is more effective, none is more formidable than modern journalism, which is a genuine "Lucifer" in that word's double signification of "light-bearer," and the spirit of evil.

The journalistic press is already—though it should be so in much larger measure—a powerful influence in the education of the people. It is more powerful in this direction than all the schools and colleges in the land, since it reaches and teaches those who know little of schools and colleges, those who have no other means of education, and to whom the shibboleth "the papers say so" is the infallible and incontrovertible dictum of *their* "consensus of the competent." It creates an interest in science among those who can learn of it from no other source; it spreads abroad the differing opinions of the world's thinkers, and awakens new thought in inquisitive minds; it sows broad-cast the winnowed seed-thoughts of great minds in such generous ways as must bring promise and fulfillment of harvest in brain fields that were elsewhere barren. It disseminates widely the stories of individual sorrow and joy, grief and gladness, and so preaches forcibly the brotherhood of man, and appeals to the otherwise untouched common sympathies of humanity; it gives to even the most highly educated, new impetus to further acquisition of knowledge by heralding the endowments, the discoveries and inventions of far away brother thinkers; and its power as a teacher of men is enhanced by its own impersonality, since it can speak to men's consciences without arousing that *tu quoque* sense of resentment or angry dissent which would be felt towards an individual. Such is the true mission and work of journalism outside its other wide work of a business and commercial advertiser and agent, and investigator of crime.

But none whose business or inclination leads them to acquaintance with the general news departments of a large number of the daily papers of to-day can fail to be impressed with another side of journalism, or can help noting the average low moral tone of the daily press—its trivial treatment of great questions; its levity in dealing with grave issues; its questionable political methods; its panderings to popular ignorance and prejudice; its encouragement of the evil passions and baser attributes of man's nature; its wilful misrepresentations of facts; its villification of the characters of those who oppose its measures; its inquisitorial prying into private affairs which in no way concern the public welfare; its belittlement of modest virtue and its homage to successful vice. All this we can only consider as vicious journalism.

That it is often necessary in the interest of law, order, morality and the public good to record the details of crime, its detection and punishment, we concede; but when no public interest is subserved, no necessary

moral pointed, no real knowledge to be gained, no earnest warning given in what is offered as sensational news to its patrons by any journal, it would be in the interests of morality if such news were withheld.

For instances of such vicious journalism we have not far to look. Before us lies a pile of recent clippings from some of the most reputable journals of the day. The limits of this article will not permit reference to a tithe of these, and these are only a sample of columns of such matter which finds its way into prominent place as *news* of general interest in leading papers; but to enforce our meaning we give the gist of a few of these. A dispatch from New York, March 20, gives the name and place of residence of a wealthy lady of unsound mind who wrote a foolish love-letter to a public functionary, and, the dispatch states, "as the story was printed in the papers" a rascally fellow made it the basis of a blackmailing scheme for which he was arrested, whereupon "he confessed that upon reading the story in the papers he thought there was a chance 'to make a hundred' and he succeeded." Since there was nothing of interest to the public in the fact of the poor demented creature's writing such a letter, it ought not to have been published in the first place, and secondly, the publication of the sequel, the arrest of the blackmailer, was but a further hint and suggestion to the criminally disposed. Another New York dispatch a day later explains that the reported suicide of the son of a prominent man was untrue, and was based upon a slight accident which occurred to a worthy young man while hunting, so affixing in the minds of those who did not see the correction, a vile stain on a reputable family name. A few days later appears with startling head-lines the details of a foolish or insane freak on the part of the son of a New York official, a freak which would have resulted in harm only to the man's reputation for sanity among those who witnessed it, but which published, did do incalculable harm in the shame experienced by his respectable relatives, and hurting the man's own future where he would otherwise be unknown. At a recent trial one of the lawyers in the case is represented as feeling deeply the references made in regard to him by a popular city paper, angrily remarking: "That dirty, filthy sheet yesterday reviled and insulted me by the publication of a lot of vile caricatures. And for what? Only because I had been doing my duty before God to my client. A friend said to me this morning: 'Why don't you shoot that——? Why don't you horsewhip him?' Gentlemen, wait. The day will come when I will meet him face to face, and when I do meet him let him beware." So of such vicious journalism crime and further wrong-doing may yet result.

A letter to the *Boston Advertiser* complains bitterly of that paper for having "its columns defiled with an

extract from the *Record* commenting on the personal appearance of some of the unhappy inmates of the State prison, and describing their occupation and their bearing. I do not speak of the shame and sorrow that such an article must inflict upon those by whom some of the prisoners mentioned are known and loved, for I suppose that anyone who could write such an article would answer that 'journalism is no respecter of persons.' But I wish to protest, as a constant reader, against such 'news.' It can do no good, and can have no attraction save for those who love to gloat over the miseries of others."

One fails to understand what possible good can be done, while seeing quite clearly the suggestions of evil which may be conveyed to unbalanced or to scheming minds by the large space so often given in our newspapers to the marital woes and mistakes of erratic and morally undisciplined people,—such, for instance, as the cases of Bishop, the mind-reader, and that young artist heiress, who married one adventurer after a few days' courtship only to leave him to run off with another a short time later. If these had been kept from the public, far less harm would have resulted to the parties themselves, and the families to which they belong would have suffered less annoying notoriety. It is not really necessary for public well-being that all the disgusting details of divorce suits should be given at length in papers which are to enter pure homes to be read by innocent girls and youth whose parents wish to keep them clean minded. No less disgusting to people of refined or humane tastes are the sickening and brutalizing reports of "prize fights," "pugilistic encounters," etc., which so frequently mar the columns of journals which enter thousands of refined family circles.

The other day a young woman, a mother, and the wife of a respectable and worthy man, was arrested for apparent drunkenness, but on inquiry it was found that she was a victim of the chloral habit, contracted by first taking the drug to relieve pain. She was not vicious; she was young and weak, and in need of strong, loving hands to uphold her and save her. There was not the slightest need for her story to get into the papers, yet there it was, with her name and address and those of her husband given,—a barrier thrown up by vicious journalism in the way of reform, hope and happiness. When any human being, from any cause, is driven to attempt suicide, we may be sure that he is in desperate straits, and that if prevented from finding ease from his pain in death, he is in no condition to bear the further strain of public pillory by having his case, with his name and address, in all the papers for everyone who had known him in happier days to exclaim and wonder over. Can any good result from placing the child of tender years, a transgressor, perhaps, from hereditary proclivities, or from evil teaching, under life-long ban by giving its

name and the particulars of its case in the journals of the day? It is enough that the police judge decides and the police records show whether the arrest was necessary or not, but if once printed, how easy it will be in after years for some enemy to hunt up this record and to mar the honest effort to earn a living or to achieve rightly earned success.

It may be urged that there is an unmistakable demand for such *news* (?), a demand which even reputable journals have to regard or be driven to the wall by their less conscientious rivals in the newspaper world; and a demand which, as impartial caterers to a varied public appetite, they are in justice bound measurably to supply, since they do not undertake or profess to create public taste, but only to prepare the intellectual food demanded in as appetizing a manner as possible.

So, too, there is a decided demand for the kind of literature which poisons and pollutes, which encourages mature vice and corrupts youth; a literature which our law-makers recognize as so vicious in its influence on the lower nature of man that its sale is forbidden by statute, and heavy penalties incurred by those who distribute it. Yet the demand for it is so urgent that unprincipled and avaricious men risk the legal punishment its sale involves, as well as the contempt of the moral part of the community in order to make money in supplying this demand. Do our reputable journals then mean to intimate that there is only the difference between these men and themselves that a wholesome fear of the law creates?

S. A. U.

GENUINE VS. SPURIOUS CULTURE.

There is a growing distrust as to the value of much that passes under the name of "culture." This may be explained in part by the unpractical and dilettanteish character and undemocratic spirit of a great deal of the so-called culture of the age which, lacking in robust intellectual qualities, without any noble moral purpose, and inspired by no lofty enthusiasm, serves only to widen the gulf between its disciples and the masses, increasing, on the one side, contempt for the "great unwashed" pursuing their prosaic avocations, and exciting, on the other side, aversion to a mere intellectualism which ignores the hard facts of life, is indifferent to the condition of the millions, and concerns itself almost wholly with mere literary questions which have but a remote bearing on the practical questions of the hour.

But it is a great mistake to confound this pseudo-culture with genuine culture, which is catholic in thought, earnest in tone, and progressive in spirit; and any standard that does not involve a distinction between them is false and pernicious. There is no culture worthy of the name which does not include with the acquisition of knowledge, development of the moral nature, strengthening of the love of right and hatred of

wrong. A man who has simply a knowledge of books, which he regards as of more importance to him than the things of which they treat; who has never penetrated behind the books and come in contact with nature herself, with the world and its events, with man and his relations; who possesses merely the instruments of knowledge, without the capacity to use them wisely; who can only repeat what he has read, and makes authority serve in the place of evidence; who can tell all about the siege of Troy, but feels no interest in the great issues of to-day; who can construct elegant sentences without giving a valuable thought or suggestion to the world; whose interest in his race is simply of a sentimental kind, animated by no moral principle or philanthropic feeling—such a man is not, properly speaking, an educated man.

Man's most important education he gets daily through eye and ear and touch in that great university, the world, in which we are all students. Some are more richly endowed or have better opportunities, and learn more readily than others. The results of thousands of generations of observation and study are condensed in languages, governments, religions, moral codes, literatures, and the intuitions of the race. Now, the object of what is commonly called education is to acquaint the child or student with these results in order to enable it to understand nature's methods; or, as Huxley says, "to prepare the child to receive nature's education, neither incapably nor ignorantly nor with wilful disobedience, and to understand the preliminary symptoms of her displeasure without waiting for the box on the ear. In short, all artificial education ought to be an anticipation of natural education."

This natural education is the instruction of the intellect in the ways of nature—which includes man and his relations to the universe—and to discipline the will and cultivate the affections so that they shall be in harmony with the highest mental and moral conditions. The man who is the most truly educated, is he who understands the most fully nature's methods, and whose character is most completely in accord with those principles, conformity to which is necessary to man's well being. A mind may be artificially cultivated beyond its normal capacity, and at the cost of intellectual vigor and virility. What is needed is more scientific culture, the development and training of the mental powers to observe, to reflect, to inquire, and to apply practically the knowledge gained. This kind of culture strengthens the mind while it gives it materials for thought, and incentives to action. We do not deprecate the pursuit of classical learning, nor do we undervalue the advantages of wide acquaintance with books; but we wish to emphasize the fact that one may be well versed in the literature of ancient and modern times and yet lack most important elements of a true education. This is an age of

revision; and the old conceptions, definitions, and methods of education quite as much as the old theological creeds need to be revised in the interest of progress.

In his late address before the London Society for the Extension of University Teaching on the subject of "The Study of Literature," John Morley wisely observed: "There is a very well known passage in which Pericles, the great Athenian, describing the glory of the community of which he was so great a member, says, 'We at Athens are lovers of the beautiful, yet simple in our tastes; we cultivate the mind without loss of manliness.' But then, remember, that after all Athenian society rested on a basis of slavery, and Athenian citizens were able to pursue their love of the beautiful and their simplicity and to cultivate their minds without loss of manliness, because the drudgery and hard work and service of the society were performed by those who had no share in all these good things. With us, happily, it is very different. We are all more or less upon a level. The object of education,—our object—and it is that which in my opinion raises us infinitely above the Athenian level—is to bring the Periclean ideas of beauty and simplicity, and of cultivation of the mind, within the reach of those who do the drudgery and the service and hard work of the world. And it can be done. Do not let us be afraid. It can be done without in the least degree impairing the skill of our handicraftsmen or the manliness of life, without blunting or numbing the practical energies."

"SCIENCE AND IMMORTALITY."

The *Christian Register* of April 7 contains a series of brief articles, several of them by eminent scientific men, on "Science and Immortality." Prof. James D. Dana is of the opinion that there is nothing in science against immortality. Prof. Asa Gray thinks that the interpretation of nature not beyond the highest scientific consideration, that the theistic hypothesis is the best explanation of the facts, and that "immortality is a probable, but not an unavoidable inference from theism." Prof. Joseph Leidy regards no question as out of the pale of science, and he thinks the facts of science make it difficult to believe in the persistence of personal consciousness after bodily dissolution. Prof. Simon Newcomb is "inclined to regard the question as lying wholly without the pale of science, properly so-called," does not think modern investigation has brought to light any new facts bearing upon it, and that if consciousness has been a gradual development as is implied in the theory of the continuity of organic life, it "seems difficult to assign any link in the series at which we can suppose so great a break to have occurred as is implied in the passage from mortality to immortality." Prof. J. P. Lesley, says "Science cannot possibly either teach or deny immortality." Prof. Lester F. Ward says that "so far as science can speak on the subject, the

consciousness persists as long as the organized brain, and no longer." "The immortality of science," Prof. Ward says, "is the immortality of matter and its motions in the production of phenomena" and that with them consciousness, the product of the eternal activities of the universe, should not be confounded. Prof. E. S. Morse writes, "I have never yet seen anything in the discoveries of science which would in the slightest degree support or strengthen a belief in immortality." Prof. Cope seems to regard immortality as possible in spite of apparent evidence against it, but doubts the persistence of our personality. Dr. Dawson, of McGill University, refers to the instinct of immortality in savage races as a "God-given feature of the spiritual nature yearning after a lost earthly immortal, and clinging to the hope of a better being in a future life." Dr. T. Sterry Hunt thinks that the "facts of modern science are rather contrary than favorable to the doctrines of a future life." Nevertheless, he believes in a conditional immortality, "the gift of God," but lacks time to explain what he means. Dr. B. A. Gould thinks there is nothing in science that should lead to disbelief in immortality. Dr. Alfred R. Wallace says, "Outside of Modern Spiritualism I know of nothing in recognized science to support the belief in immortality, and though, I consider Spiritualism to be as truly an established experimental science as any other, it is not recognized as such." Dr. Asaph Hall thinks science gives no positive answer to questions concerning immortality, but that modern discoveries tend to strengthen the belief. Dr. Elliott Coues says "There is much in the discoveries of psychic science not only to support or strengthen the belief in immortality, but to convert that belief into knowledge." Herbert Spencer, according to Rev. M. J. Savage's recollection of a conversation with him, does not think evolution touches the problem of personal immortality either way, and he sees no satisfactory proof of the truth of the latter doctrine. President Barnard, of Columbia College, N. Y., says, "After mature reflection, it seems to me that science has nothing whatever to say to the question. The only basis of our faith in immortality must be found in Revelation." A quotation from Huxley's article in the *Fortnightly Review*, December, 1886, raised the question whether the state of consciousness associated three score years and ten with the movements of countless millions of successively different material molecules, can be continued with some substance which has not the properties of "matter and force." Huxley's reply is, "As Kant said on a like occasion, if anybody can answer that question he is just the man I want to see." In commenting on this and other notable expressions of opinion which it publishes, the *Register* remarks, "If unanimity can be found anywhere in these articles, it is most nearly attained in the general concession that science cannot show that immortality is impossible."

Mr. Edwin D. Mead, of Boston, who is well known to many of our readers as a vigorous thinker and writer, will be in Chicago shortly, and will give a course of five lectures in Apollo Hall, (Central Music Hall building) 45 Randolph. Two of them will be on Dante, one on Lessing, one on Kant, and another on Carlyle and Emerson. They will be given Tuesday and Friday afternoons, beginning April 29. This will be a rare opportunity for the Chicago public.

* * *

Enthusiastic free-thinkers who say, "Let us establish a few free-thought colleges and universities," should count the cost and consider the difficulties to be overcome. The president of Harvard University was recently asked as to the cost of starting a similar institution. "Oh, about five million dollars," was the reply. "Two or three down and the rest within ten years." When free-thinkers are willing to contribute several million dollars to found and support a broad, unsectarian institution of learning, we can have universities that will do better work perhaps than any now can do. But a college, with half a dozen poorly paid professors and thirty or forty students, all holding about the same views, must of necessity be small and narrow, however large and broad the name. What our young men and women need is such contact with able minds, such familiarity with all schools and phases of thought, and such access to the best results of scholarship as can be had only in large universities with ample endowments. They ought, indeed, also to have more familiarity with our own literature than can now be obtained, so far as we know, in any institution. For this purpose we need, not new colleges so much, as new professorships in the old ones, the establishment of which seems feasible, with the condition that the incumbents should be chosen by a board of trustees composed of the original givers of the money and their successors, said board to fill its own vacancies and make its own appointments forever. Where this cannot be done free-thinkers might do what the Unitarians did at Ithaca and Ann Arbor—settle a missionary to give scholarly lectures weekly to the students, distribute their literature and spread their views by personal intercourse. The general flow of public education is already so much in our favor that we need only to broaden and enrich it. Nothing is so bad for us as to attempt to support little sectarian institutions. We ought to set our faces against every school or college which dwarfs and cramps itself at the start by the narrow aim of propagandizing any kind of sectarianism, philosophical or other. Our public schools are greatly in danger from sectarian rivals, who should have no support from us. If there is any want that we are especially bound to supply, it is that of better teachers and text-books. At the same time there is need of a broad unsectarian institution for instruction in all the

systems of philosophy and religion. The lecturers should be competent representatives of the systems respectively, the freest and fullest criticism should be encouraged, and the work of the institution should be limited to this instruction. The amount of money necessary for the establishment and support of such a school it would, we believe, be possible to raise.

* * *

Ernest Renan, in his *Studies in Religious History*, speaks of the relation of man to the universe. The aim of humanity will ever grow higher. Intellectual culture will gradually exclude supernatural belief, but religion will never be excluded, it will but grow grander and nobler as intellectual culture dissipates the mists of superstition that have through so many ages enshrouded it. Man is not subject to the caprice of an unseen being who looks upon his struggles and sufferings with indifference. But he is a part of, and dependent upon the whole universe, and his duty is to conform himself to the order of progress and development which the universe is following. To strive faithfully for the supreme good is virtue; to seek to bring about the higher development of man is the work of the world.

* * *

The Problem of Evil: An Introduction to the Practical Sciences, by Daniel Greenleaf Thompson, of New York, will be issued in May by Longmans & Co., London. This work will be looked for by many with deep interest. Mr. Thompson is known among thinkers by his *Psychology*, the ablest and most comprehensive work on the subject that has appeared from the pen of any American author. It is a work of 1,193 pages, in two volumes, published by Longmans & Co. in 1884, and inscribed to his distinguished relative in the following language:

These volumes are inscribed by a kinsman of a later generation to the illustrious memory of *Sir Benjamin Thompson, Count Rumford*, a philosopher, statesman and benefactor of mankind, a great prophet, who, while living, was not without honor save in his own country, and upon whom, dead, that praise justly due to a merit almost unrivalled among men of science has been but tardily and incompletely bestowed both by his own family and his countrymen at large.

* * *

Ethical culture draws the critical fire of two March Episcopal reviews. Rev. J. A. Harris, D.D., considers the general ideas of the movement in *The Church Magazine* (Philadelphia, Hamersly & Co.), and Rev. Welford L. Robbins criticises Dr. Stanton Coit's article on "The Final Aim of Moral Action," which appeared in the English philosophical quarterly *Mind*, July, 1886, in the *Church Review*. Both are a great improvement on ordinary theological polemics, though neither goes very deep.

THE RATIONALE OF PUNISHMENT.

BY CELIA P. WOOLLEY.

The practical benefits arising from the new science of sociology are nowhere more manifest than in the improved methods of reform employed in our care of the poorer and disorderly classes of society. It is not, however, methods of reform and punishment of which I wish to speak in this paper, but rather of those underlying principles which determine and explain methods. It is our philosophy of life, our theory of man, his nature and conduct, which goes far to determine the character of our relations with our fellow-beings. The parent must of necessity train the child according to his views of the child's nature and destiny. If he regards it as the child of sin and wrath, totally depraved in every instinct and desire, he will endeavor at every turn to surmount its wish with his own more enlightened authority, to hedge it about with a system of restraints and checks, and to break rather than guide and educate the will. There are not many present households where this gloomy theory is held. Where parents once erred on the side of severity, believing the child to be a creature of evil impulses, an interloper in God's kingdom, the parent of to-day, regarding his offspring as the heir of all the ages, and intoxicated with the idea of individual liberty, errs, with equally grave results, on the side of generosity and weak indulgence.

Taking a wider survey of society in general, here also it is our philosophy which defines our relation to the unfortunate and criminal classes. If we look upon these as so many vicious malcontents, with an natural tendency to lawlessness and crime, we shall have no hesitation in applying only those methods of punishment based on the right of self-defense; while if, on the other hand, we regard the criminal as an unfortunate victim of circumstances he has no power to control, the irresponsible ward of the community in which he lives, we shall seek relief in those milder methods of reform so popular among certain sentimental philosophers of the times. Taking middle ground between these two extremes, and looking upon criminal practice of all kinds as the sign of the remaining brutishness of man, not yet outgrown from the conditions of his animal origin, the only means of cure seems to lie in the slow, safe processes of general education, where the methods of wise restraint are united to those which aim to reform and develop the individual character. Thus we see that while the theory of punishment is only indirectly concerned with the question of methods, it bears a direct relation to the object. What, then, is the object of punishment?

J. R. Brockway, a practical philanthropist, who brings eminent ability as well as experience to bear on the discussion of such themes, in an address before the National Prison Congress, a few years ago, spoke as follows of imprisonment, and the same applies to all

forms of punishment: "Civilized sentiment concedes that the protection of society is the main purpose of imprisonment * * * but the effective protection requires one of two conditions, the reformation of the criminal or his continued detention." In Cox's *Principles of Punishment*, a work of much merit, the objects of punishment are described as three in number; 1st, to set an example to society, generally spoken of as the deterrent principle; 2nd, to prevent a repetition of the offense, and 3d, to reform the criminal. Mary Carpenter is careful to insist that while all punishment should include the deterrent principle, it should never be associated with a vindictive motive. Sir Walter Crofton makes the object of punishment two-fold, that of amendment and example. At the risk of seeming presumptuous, after quoting from so many distinguished sources, I must say, that to my own mind the distinction between the two principles underlying all punishment is made clearer when we describe the one as vindicatory and the other as the reformatory. Let no one hastily assert the identity of this vindicatory motive with the vindictive, for though the two words are partially connected in the latin root, time and long association of the different ideas they represent, has sufficiently distinguished them from each other.

The objects of punishment are plainly only two, the protection of society against a repetition of the offense, and the amendment of the character of the offender. The deterrent principle is simply incidental, one which serves an excellent purpose, but can never justly be made a direct object of punishment, since society has neither the right nor duty to punish for the sake of setting an example.

All punishment being two-fold then in its object, the first, or the vindicatory, is first not only in the order of naming, but in that of necessity. The principle of self-defense is one of imperative first choice among organized communities as with the individual. Society must protect itself against all encroachments upon its hard-won peace and safety before it can attend to the needs of its special members. It may be admitted without detriment to the main argument, that in the long run this protection is best secured by the employment of those means which tend to improve the general standard of conduct, and that the vindicatory end of punishment is, in the final result, attained only through the reformatory; but this does not obviate the necessity of those coercive measures which contribute to the security of to-day.

Of these two motives underlying punishment the vindicatory had at first exclusive sway, and has been gradually supplanted by the reformatory as man has progressed in the order of humane civilization. It is this which leads many zealous philanthropists to declare that the reformatory principle will in time, entirely

supplant the vindictory, but here, it seems to me, they greatly misapprehend the nature of the problem in hand.

The belief so ardently cherished by a certain class of reformers that the criminal is a creature more unfortunate than guilty, the victim of circumstances, "society's mistake," as he has been called, bids fair to become one of the popular social superstitions of the age.

In the old theology we were taught that it was man's carnal nature which lay at the bottom of all his misconduct; under the guidance of the new philosophy, imperfectly understood, we are in danger of reaching the other extreme, attaching the blame of all that is false and evil in our surroundings to the universe in general. We need a revival of the doctrine of free agency which is not so incompatible with the teachings of modern science as we are apt to imagine. Above all, the youth of our day, and the criminal and unruly orders of society should be taught that within themselves lies the power of choice between good and evil. Punishment of all kinds should be made to bear the relation of effect to cause, otherwise it serves only to harden the nature and create disrespect for all authority. Punishment is salutary only as its meaning is intelligently understood by the one to whom it is administered. "Ah, parents!" exclaimed Charles Kingsley, "Are there not real sins enough in the world without your defiling it over and above by inventing new ones?" This is indeed the result of many present modes of punishment. Instead of curing the old sins we invent new ones by setting up a host of arbitrary standards and meaningless rules which bear no relation whatever to real right and duty. A newspaper anecdote illustrates this point: Two boys were on their way to the river in search of a half day's amusement, one of them in direct disobedience to his father's command. He was reminded by the other of the probable consequences of this act, and his reply evinced the spirit of modern boyhood. "Pooh," he exclaimed, "what is five minutes' whipping to four hours of fun." What, indeed, from the boy's standpoint? What connection was there in his mind, except the most forced and arbitrary, between a half day's sport at wading and fishing and the threatened punishment? He felt himself to be in the hands of a superior force, to which he must submit, but to defy and circumvent which was the free and glorious privilege of every self-respecting boy. Turning to that child of larger growth, whose history we read in the annals of the police-court, we find him weighing the risks and chances attendant on his peculiar method of making a living with consummate coolness and skill. To him the rewards of cunning and dishonesty more than balance those of virtuous industry, while the pains and penalties attaching to discovery are but the incidental inconveniences in a life given over to risk and excitement. The habitual criminal has neither the culture nor experience which teaches the relative

values of things. In spite of his boasted knowledge of the world he is the merest tyro in real experience of men and motives. Knaves and fools are properly classed in the same category since both are deficient in logical understanding, contenting themselves with the nearer, fleeting good, the success cheaply won or stolen, in place of the difficult but lasting triumphs achieved in the growth of character and honest reputation. One of the characters in an old play, the rogue who is entrapped and discovered, betrays a profounder knowledge of men and motives than he had ever learned before, when he contritely observes that "the man who invented truth was a much cunninger fellow than I took him to be."

The contrast afforded in the teachings of the Jewish and Christian Scriptures on this subject contains an instructive suggestion for us. The first stands for that bare and poor idea of justice evinced in the words, "And thine eye shall not pity, but life shall go for life, eye for eye, tooth for tooth, hand for hand, foot for foot." The second, on the other hand, teaches that unqualified mercy laid down in the precepts, "Thou shalt love thy neighbor as thyself," "Sell all thou hast and give to the poor," "If a man smite thee on one cheek turn to him the other also." Taking the two systems together we have in these representative statements of belief, law and gospel as it pertains to the particular department of ethics we are considering. This division of the law and gospel, crudely as it is set forth in the popular theology of the day, is not so artificial as at first appears. Nature as well as religion has her law and gospel, her instinct of justice and her instinct of mercy. In all human experience we may also note this same divided impulse to action, and the highest philanthropy is that which wisely blends the two; the instinct of strict justice with that of a loving charity. Neither the Jewish nor Christian scheme, taken alone, contains a complete code of practical morality. In the first the sense of retribution is too strong, tyrannizing over every gentler feeling; while in the second we are in danger of losing it altogether in the undue emphasis placed upon the duties of self-sacrifice, patience, etc. Yet each served, and continues to serve, its part in the evolution of conduct.

Herbert Spencer justly makes the formation of character the primary object of all education. "To curb restive propensities, to awaken dormant sentiments, to strengthen the perceptions and cultivate the tastes, to encourage this feeling and repress that, so as finally to develop the child into a man of well-proportioned and harmonious nature—this is alike the aim of parent and teacher." In the same connection he adds: "Character is the thing to be changed rather than conduct. It is not the deeds but the feelings from which the deeds spring that requires dealing with." Richter has a thought of the same import when he says, "What you desire is not the child's obedience, but his inclination to it, love, trust,

self-denial, the reverence for the best." All this is excellent, but it does not diminish the importance of the principle I would insist on, that in the spirit of obedience, carefully instructed, lies the fundamental help and safeguard of all character. "Character is the thing to be changed rather than conduct," says Mr. Spencer, but would it not be more correct to say, "Character is the thing to be changed *along with* conduct." Character is a thing of slow growth. Society cannot wait until a man's principles are correctly formed before requiring his submission to rightful authority. It is his overt acts, his external conduct which she is obliged to take note of, not his inward motive and disposition, though these are, in their place, the proper subjects of her care. Though in a certain sense it is true, it is by no means enough to say that society is responsible for this or that evil condition. Society is a myth, an intellectual abstraction, a glittering generality. Its human factors, the men and women composing it, are the only real thing about it, on whom devolves the responsibility of all its failures and triumphs.

We are living in a new era of social life and experiment where the sentimentalist is equally out of place with the old time fanatic. When a monstrous wrong like slavery is to be done away with we require those heroic methods that belong to social revolution. The work of the reformer of to-day is of a slow and plodding order, because he has a more intricate problem to solve than any of his predecessors. It is comparatively easy to sign a historic document like the Declaration of Independence, to set free a million serfs, to strike the shackles from the black man's wrists. These are the great leading events of history, but about which cluster a host of complex problems on whose just solution hang those promises of benefit to the world which the first contain. The present is the age not of great, bewildering achievements or marked changes in the moral progress of man, but of slow and steady growth.

I close then with the old appeal for a reawakened sense of personal moral accountability. The great need of this and every age is that of a righteous, intelligent will power. Teach the child and the criminal, who is also a child in understanding, that the merit and blame of their conduct rest chiefly with themselves, and that the reward or punishment which follows is but the unavoidable result of their own action. Teach both, that while they are but units in the community to which they belong, they are none the less active, responsible agents therein, and not the passive tools of fate and circumstances. Teach them also that as they are but dependent parts of a single whole, the wisest self-interest is coincident only with the general good; that respect for just authority and regard for the rights of others are duties of paramount importance. Thus shall we impart to each that rational conception of life, that enlightened

view of conduct and duty which in itself is the greatest aid to a happy and useful existence.

CORRESPONDENCE.

FREE-THOUGHT EDUCATION.

To the Editors:

MORRIS PLAINS, N. J.

May I venture a few remarks suggested by Prof. Davidson's paper upon Free-Thought Education?

While it is impossible to overestimate the importance of such institutions as he proposes, may it not be possible to be too sanguine as to their results? Would, in point of fact, an atmosphere of unadulterated "free thought" conduce to the healthy growth of free-thought principles?

The advantages of mental growth in free-thought schools and colleges as compared with those of orthodox establishments, would be equal to the advantages for muscular growth in country life as compared with city life, but that is all. Healthy growth is possible in both.

It must not be forgotten that, paradoxical as it sounds, a free-thinker may develop into a dogmatist, and the free-thinking parent or teacher who imposes his thought upon the mind of child or pupil because he himself has achieved freedom, shackles the younger mind as surely as the orthodox professor who admits no question of the infallibility of his belief.

For *what* is freedom? It is not the *acceptance* of free-thought opinions as held by others; nor is it even the *choice* of such opinions; it is that mental condition which makes such a choice possible, and which in itself presupposes the existence of at least two distinct possibilities. *Freedom* implies the existence of the possibility of choice; choice includes doubt, consideration, the possibility of conflict; without these freedom is impossible.

Yet how few parents, and still fewer teachers, recognize this—how few will frankly say to child or pupil: "Such is my opinion upon a given subject, but I do not ask you to adopt it. It is the result of my experience and maturity, but in that respect only is more valuable than yours. I must tell you that others of my age, and equally mature, hold views directly opposed to mine; I will endeavor to show you the grounds for both opinions, and with you, after such explanation, lies the responsibility of choice; that is your inalienable right of freedom."

Yet, if this is not done, the very fact that parent or teacher is a free-thinker lessens the possibility of freedom for the younger mind. Probably the reason why the children of great thinkers rarely equal their parents in the same direction, lies in this. They accept the opinions which make the atmosphere of their lives, and do not realize the conditions which determined their choice, and acceptance in such circumstances is not freedom.

In all ages the descendants of reformers have lacked the zeal of their fathers. Every enthusiast asks sadly, "who will carry on my work?" realizing that the very minds formed by his teaching may lack that which inspired his own, viz., the existence of distinctly opposing elements.

Free-thinkers, if in less danger than orthodox professors of over-estimating their beliefs, may yet in their enthusiasm err in somewhat similar fashion. Hegelians, Aristotelians and Rosmians can, we all know, hold very tenaciously to the superiority of their own views, and wage as acrimonious a warfare in their behalf as the staunchest Tractarian or Presbyterian.

Unless, indeed, "a man's reach exceed his grasp," where is freedom for his pupils.

The ideal educational atmosphere must always be that of free discussion, which shall recognize and include views of every kind, even those opposed to its own principles, and permit to its pupils the absolute, unshackled exercise of individual choice,

which is freedom—an institution in which there shall be no dominantism even of philosophy—in which, if after acquiring knowledge of different opinions the student (exercising his inalienable right of choice) prefers the shackles of orthodoxy, will retain the respect of his teachers.

Mr. Davidson instances the earnestness of Roman Catholics in the establishment of exclusive schools as a worthy example for free-thinkers. But while cordially admitting this, does not the reflection arise that the very existence of such special schools has fostered the bigotry and narrowmindedness of Romanists, and may there not be a possible danger, even if in less degree, of philosophic bigotry in institutions exclusively devoted to the children of free-thinkers, who already in their own homes enjoy the atmosphere of freedom and perhaps find in orthodox schools and colleges the very element necessary to furnish the possibilities essential for freedom of choice?

Yours truly,

JANET E. RUNTZ-REES.

MR. CONWAY'S WORK IN ENGLAND.

To the Editors:

LONDON, ENG.

London is less interesting since Mr. Conway has ceased to be a central figure in its pulpits. Permanency of occupation, as you know, makes the reputation of the pulpits. We have four or five preachers of mark, and Mr. Conway was always named among them. Mr. Spurgeon, Dr. Parker, Mr. Stopford Brooke, Mr. Haweis, are familiar names of notable preachers in London, but strangers visiting London would also ask for South Place Chapel while Mr. Conway was with us. He was known as the "American preacher" in London, who attained and sustained a reputation among us. Forty years ago I was a seat-holder in South Place Chapel, when engaged in editing the *Reasoner*—not taken to be an entirely orthodox publication. W. J. Fox, known subsequently as the great orator of the Anti-Corn League, was then the preacher. Always having personal friends in the congregation I used what influence I had to promote the election of Mr. Conway, a preacher whom I believed would sustain the reputation of the pulpit which Mr. Fox had made famous. This proved to be true. The other day an article opened in one of our chief journals saying, "The chapel where Mr. Conway preached—certain remarkable meetings have been held." Just as used to be said in former years "The chapel where Mr. Fox preached." Since Mr. Conway left, many persons of mark have occupied his platform, but none have proved to possess those various "all round" qualities impelling the congregation to choose one as permanent minister. South Place is as free as the Parker Memorial Hall in Boston. We have no other church like South Place in England. Its congregation is absolutely without fear. Whoever has distinctive ideas to proclaim, which have the spirit of reverence in them, Mr. George Hickson straightway submits such name for hearing. It is no mean proof of Mr. Conway's power and versatility that he sustained the interest for 21 years, of the most cultivated and critical congregation in Great Britain. I remember when first he came to England, that Mr. Samuel Lucas, the editor of the *Morning Star*, who was a brother-in-law of Mr. Bright, and therefore knew what eloquence was—telling me that "he had heard a speech of Mr. Conway that he thought was as eloquent as anything to which he had ever listened." So far from Mr. Conway's powers abating or his influence decreasing with years—his repute was greater when he left us than it had been before. In some of his later published sermons there were passages of eloquence and beauty worthy of our best English preachers of the days of Jeremy Taylor and South. Mr. Conway left also a name of mark in literature. A paper of his appeared in the *Daily News* upon London. It was a poem—nothing so fresh, original and striking has ever been written upon the great city by an Englishman.

GEORGE JACOB HOLYOAKE.

THE IDEAL.

BY W. F. BARNARD.

This is the crowning glory of our lives;
That deep within the soul there lives a thirst,
An aspiration to the highest, wrought
Of perfect love. A longing half expressed
For something far above the what-we-know
Or can imagine; making sweetest pain
Of all our incompleteness.

All our souls
Are but the shadows of the souls to be;
And all our life is but the lesser life
That grows to greater as it yields to love.
We yearn toward the invisible, we set
Our faces to the East to find the goal,
The something that we call the perfect life,
Whose echo moves within us evermore,
And moving molds us. Higher thoughts, and deeds
Of nobler purpose, grander, truer lives;
These we aspire to, these we strive to gain.
And ah! the strife is noble, for our paths
Do not lie always where the feet would go;
No, not forever do we journey through
Fair fields where peaceful rivers glide to sea
And nothing jars, but all things seek their ends.
Sometimes our guiding star hangs dim and pale
Far in the distance, and our feet are set
Upon the borders of such arid wastes
As seem the very abodes of living death,
And all the air is sown with thick despairs
That rush to overwhelm us.

In such night
The voice of duty calls us to obey;
To still pursue and not be overcome;
To gird ourselves with high exalted thoughts
Of all our lives' fair possibilities.
The dawn will come when night has spent itself,
And so we brave the darkness waiting dawn.
It comes at last and oftentimes with it come
Thoughts of that nobler manhood yet to be,
And of that glorious future world whose laws
Shall sphere themselves in perfect harmony.
Then rises deep emotion in the breast,
And in that highest moment when the soul
Is free from all the burden of the world,
Cleared for an instant of Earth's hampering dust,
We feel a touch. Our nobler, truer selves
Yearn toward us through the vast that lies between,
Till all we are seems merged in what might be,
And all our love grows ecstasy of faith.

Poetry can be to man what love is to the hero. It can neither counsel him, nor fight for him, nor yet do any special work for him, but it can teach him to be a hero, summon him to great deeds, and equip him with the strength for everything that he should be.—*Schiller*.

BOOK REVIEWS.

WUNDT'S ETHICS.

Ethik, Eine Untersuchung der Thatsachen und Gesetze des Sittlichen Lebens. Wilhelm Wundt. Stuttgart, 1886.

A careful study of this book is especially to be commended to Englishmen and Americans, among whom utilitarianism is spread so widely and is so often thought the only possible theory of liberal ethics.

Wundt has given much attention to the English views of his subject. In the preface he says: "The English philosophy of morals has been to me very valuable, although I must confess more negatively than positively. I am, throughout, in opposition to its individualistic and utilitarian tendencies, but my conviction as to the untenableness of this standpoint, is chiefly due to the study of the English Utilitarians; and he who knows the part which error has to play, in the development of science will recognize that my judgment contains besides the censure a praise which is almost equal to the renown of a discovered truth."

Wundt's *critique* of Jeremy Bentham's theory of ethics based on pleasure and pain (p. 336, etc.), and that of John Stuart Mill, the most ingenious disciple of Bentham (p. 341), is very interesting and, I should say, unanswerable. Of Herbert Spencer, Wundt says: "Herbert Spencer's entire philosophical system is built upon the doctrine of evolution. Spencer, as he points out himself, had conceived this idea before the publication of Darwin's works. But at any rate Darwin's views have influenced Spencer's system greatly, and his later work on ethics shows traces of Darwin's influence more than his earlier works.

"Spencer's ethical views are ruled by Darwin's ideas of adaptation and heredity. According to the principle of adaptation the moral is identical with the useful; and the useful again is the adjustment to surroundings and conditions of life. Conditions of life being variable, our moral concepts must undergo constant changes, and a constant absolute moral code cannot exist, although there can be no doubt that some acts have been injurious in all times, while others in all ages have been recognized as useful; similarly, physical organization shows congruities in its different stages of development."

"It is the principle of adaptation which leads Spencer to a utilitarian relativism which is also to be met with, implicitly, in his predecessors of a utilitarian character. But Spencer lays special stress on the relativity of moral conceptions, and thus reveals two weak points of utilitarianism. First, there is no discrimination of the moral, proper, and other forms of the useful which, according to our consciousness, cannot receive an ethical valuation." On page 363 Wundt adds to this: "From this point of view we should be obliged to consider the invention of printing, of the use of the compasses, of the steam-engine, of antiseptic ligature as eminently moral acts. Concerning the invention of gun-powder and dynamite we may be undecided, or should say that they are partly moral, partly immoral. On the other hand, as utilitarians are obliged to admit that many things which we are wont to consider as merely useful, should be declared to be moral; so on the other hand from their standpoint, many things should be declared immoral, or at least indifferent, which heretofore were praised as moral; for instance, if the father of a family or a man whose place in human society is difficult to fill, makes an attempt at saving a drowning child at the risk of his life. * * * In this case, to be sure, the utilitarian would say not the single action must be useful, but the average character of actions must be such as under ordinary circumstances to increase human happiness."

"The second weak point of the ethical adaptation theory consists in its appreciation of the *effect* or *result* of an act and the entire neglect of the *intention* in which it is done. But such is a

matter of course, if the ethical appreciation takes place, as an engine is valued according to the effect of its work. The intention with which we act is to Spencer not a primary but a secondary point for our ethical judgment, and then only so far as it warrants the probability of future usefulness." Spencer makes the sequences of an act the test of its ethical value, while Wundt wants the motives to be considered.

"So far Spencer does not deviate much from the utilitarians before him," Wundt says, "but he has added a new aspect to the problem by taking into consideration the doctrine of inheritance."

"A great difficulty of Bentham's utilitarianism consisted in showing how egotistic desires may become motives for public utility. Spencer answers this question by transferring the problem from individual experience to the evolution of the race. As there are innumerable generations at our command the difficulty is greatly lessened. In the human race some fundamental moral conceptions have been developed and are developing still. These conceptions are the result of experiences as to what proved to be useful, and are inherited through transference upon the nervous system."

"Against this theory there is only one objection,—that the difficulty which is eliminated is less than the difficulty which is introduced. * * * If even such elementary data of consciousness as sensory perceptions, or the conception of space cannot be proven to be innate, how can we speak of inborn moral ideas which presuppose many complicated concepts relative to the acting person as well as to his surroundings. * * * Practical neurology is contrasted with such fantastical views, as astronomy and geography, are with the discoveries of Jules Verne; and the old theory of *ideæ innatæ* in its naïveté, according to which the chief subject matters of morals, metaphysics and logics were considered a cradle gift of God, is preferable at least for its simplicity. We acknowledge, therefore, that an important step has been made in the history of modern English utilitarianism when the idea of evolution was introduced; nevertheless, Spencer's attempt at deducing the moral development, which may be found in the progress of civilization simply from conditions of individual evolution, is best qualified to demonstrate the impossibility of such an explanation."

In opposition to the utilitarian theory, altruistic principles have been proposed by Hutcheson and Schopenhauer. They declare only charity and sympathetic emotions with our fellow creatures to be ethical. All egotism is objectionable. But since Leibnitz, Kant, Goethe and others pointed out that self-perfection was one of the duties of man, we should say that the extreme altruism does not afford a tenable principle of morality. And so Wundt explains how a kind of moderate altruistic utilitarianism became the ruling opinion of modern ethics, viz. those of Germany.

Wundt divides the sciences into descriptive and normative. Descriptive sciences are psychology, history, the natural sciences, etc.; the normative sciences are jurisprudence, logics, aesthetics, grammar and ethics. The former treat things as they are, the latter as they ought to be. But the *ought* is not quite missing in the former sciences. From many irregular facts gathered by experience the *ought* appears as a natural law. So the *ought* that *is*, becomes a *must*. The Norm, congruent with real existence, is necessity. In the background of grammar and the other normative sciences, logic stands. "Logic is only the ethics of thinking; ethics," Wundt, says, "is the ultimate normative science, the moral *ought* is the last source of the norm-idea."

In establishing the basis of his ethics Wundt starts from the individual will, which he contemplates in its conditions and relations. From this fact as the original datum, motives and norms of action rise which surpass the individual consciousness and point back to a universal will, the bearers of which are the indi-

viduals, and in the ends of which the single provinces of individual aspirations are comprised.

Omitting Wundt's explanations of his principles of morality, we proceed to the last and practical part of his ethics in which he propounds a synopsis of the moral norms. They are of (1) individual, (2) social and (3) human character; each of them is subjective as well as objective, and contains as much of a right as of a duty.

The subjective individual norm is *self-respect*, which he formulates as: Think and act in such a way as to never lose your self-respect. The objective individual norm is that of *duty*: do your duty to which you are pledged. The subjective social norm is what the Bible calls love of the neighbor: respect your fellow-being as you do yourself. The objective social norm is the interest in the welfare of the community or society (*Gemeinsinn*). It requests us to do services to the community to which we belong. The subjective humane virtue is humility. We have to consider ourselves as mere organs or instruments of our moral ideals. The objective humane virtue is unselfishness, which commands us to sacrifice ourselves for the purpose which we recognize as the ideal purpose of our life.

It would lead us too far to touch on the details of Wundt's voluminous work. With this review we can only invite to a study of the book and heartily wish for a readable English translation.

In his results Wundt approaches, as he confesses in the preface, the ethics of the post-Kantian speculative idealism, which is the more noteworthy, as Wundt is by no means a mere speculative philosopher, but primarily a scientist, and among scientists he leads the van on the subject of neurology. He adds in his preface that there may be more reason to wonder at this outcome, for he must confess that on other subjects of philosophy similar results will be reached, which will give credit to the philosophical work done in the beginning of this century.

"In judging of philosophical doctrines," he continues, "one should distinguish the everlasting tenor (*Inhalt*) from its transient formulation (*Form*). Philosophical systems, which once impressed deeply the human mind, having arisen in a time of transition and belonging now to the history of the past, should neither be condemned as chimerical dreams nor revered as eternal truths. The useless frames of such systems were destroyed, but their vital ideas took root in all single sciences, and by and by philosophy will be regenerated through the reaction of the sciences. Thus in the general views of philosophy much must be changed, and in minor details most, perhaps all, is to be corrected; nevertheless philosophy inaugurated the work which had to be temporarily intrusted to the sciences, and philosophy finally will have to consummate it."

PAUL CARUS.

HEREDITY. A Psychological Study of its Phenomena, Laws, Causes and Consequences. From the French of Th. Ribot, author of *Contemporary English Psychology*. New York: Appleton & Co., 1877.

Th. Ribot, the director of the *Revue Philosophique*, at Paris, and one of the most prominent French savants is distinguished for the breadth and earnestness of his thought. He has been the interpreter of the contemporary German and English philosophy to his countrymen by several meritorious treatises. His special department is psychology as it is based on physiological research. The present valuable work on heredity (which was first printed by the Appleton's in 1875,) bears on the same subject. Ribot defines *instinct* to be a *composite reflex action*, and explains it as an unconscious mode of intelligence. Instincts, it is possible, are only habits fixed by heredity (p. 22), but he declares (p. 33) that this explanation is rather vague and inaccurate. "As instinct rises it approaches intelligence and as intellect descends it approaches

instinct." With regard to the causes of heredity Ribot believes that the psychological instances should be explained from the physiological cases of heredity. Physiological heredity, he says, will be admitted without hesitation. Although this savors of materialism, he thinks that his solution is reconcilable with philosophical idealism. No doubt mental manifestations often influence the organism, but heredity belongs to the domain where the organism influences the mental manifestations. "Heredity thus understood, appears to us," he says on p. 275, "to be merely one of the many physiological influences to which mental development is subject."

The causes of physiological heredity are to be looked for in the law of the persistence of force. "The definite result of these researches is that heredity is identity as far as is possible; it is one being in many. 'The cause of heredity,' says Haeckel, 'is the partial identity of the materials which constitute the organism of the parent and child and the division of this substance at the time of reproduction.'"

Most interesting are Mr. Ribot's investigations on the consequences of heredity, which is in so close connection with evolution and even is the cause or condition which makes it possible. Heredity is a form of determinism and yet it leads from the automatic act of animal instincts to the freedom of human intelligence. Now, which of the two is at the bottom of phenomena in nature, mechanism and law or personality and freedom? At times we are inclined to say the one, at times the other. Ribot concludes with the sentence: "Were we to occupy a higher standpoint, we should see that what is given us from without as science under the form of mechanism, is given us from within as aesthetics or morals under the form of free-will." P. C.

COMPARATIVE PHYSIOLOGY AND PSYCHOLOGY. A Discussion of the Evolution and Relations of the Mind and Body of Man and Animals. By S. F. Clevenger, M. D., etc. Chicago: Jansen, McClurg & Co., 1885; pp. 247.

The author of this discussion is a scientific thinker well equipped with a store of accurate knowledge, and quite dexterous in making use of it. Moreover, he is one of those rare men capable of disinterested enthusiasm and thorough devotion to a high cause. His desire is to acquire so complete a knowledge of the human organism, and especially of its nervous system, as will enable him scientifically to understand the precise nature of mental derangements, hoping thereby to devise ways and means to alleviate the sufferings of a numerous and most unfortunate class of fellow-creatures. The work touches on almost all biological problems, and has an ingenious explanation for most of them. We readily believe the author when he assures us that he found it impossible to crowd together in this small compass all the thoughts contained in his note-books. Nature is cruel. "Of fifty seeds she often brings but one to bear," nay, sometimes none at all.

Of course, it is out of the question in a brief notice like this to take account, much less to examine every one of the numerous flowers scattered broadcast from this cornucopia. The ideas are, however, mostly interesting, some of them very suggestive, and a few of great and lasting importance; only they will have to be scientifically proved before they can gain general acceptance. The following are the titles of the fifteen chapters of his book: Introduction; Primitive Life and Mind; Organogeny; Genesis; Development; five chapters on nervous and mental physics; Morphology, Histology, and Evolution of the Human Brain; three chapters on mental activities; the Law of Expediency and Optimistic Conclusion.

Dr. Clevenger, in common with most physiologists and pathologists of our time, takes psychological phenomena to be functional outcomes of the organism, and in endeavoring to ex-

plain such phenomena in their connection with vital processes, he looks upon the latter as the cause of the former, differing here from psychologists generally, who accept the two-sided aspect as a working hypothesis. Such and such processes are going on in the organism, and we find them accompanied by such and such mental phenomena, or *vice versa*. When (page 202) Dr. Clevenger defines sensations as "conditions of the molecules realized in consciousness," one might as well, or even better, turn the tables and assert that molecules, with their positions and motions, are conditions of the sensations realized in consciousness. The investigator is comparing his two corresponding aspects, the subjective and the objective. They are not the *cause* of each other.

Our author announces chemical affinity as his leading principle in the explanation of vital processes, but in his chapters on the physics of the nervous system, adopts, nevertheless, the undulatory hypothesis. By means of waves one can explain everything in a mechanical way, for all necessary mechanical factors are assumed to begin with. Where the exact value of these factors cannot be ascertained, the hypothesis is utterly worthless. In vital processes we have to do with qualitative distinctions, and these are of chemical origin. The disturbance set up in a nerve by stimulation is strictly chemical. It is due to explosive disintegration. Functional disintegration is the immediate effect of stimulation on any kind of protoplasm—not undulatory motion.

Dr. Clevenger's idea, that nutritive assimilation is due to saturation of chemical affinities, is a great advance towards light in the total darkness that prevails in biological quarters with regard to this most important function. It is usually assumed without explanation, as an occult vital achievement, somehow effected in the unexplored recesses of the mystery of life. Here are the vital molecules and here the nutritive pabulum. Now shut your eyes. One, two, three, and the dead material of the pabulum has been magically converted into ever so many other living molecules. This is virtually what many biologists teach. Nutritive assimilation is, in all verity, chemical saturation. When Dr. Clevenger shall find out how the want for nutritive saturation arises in the living substance, he will have secured the most potent help in his attempt to construct biology, deductively, from primitive functions of life.

Our author's intervertebral theory of brain formation stands, as he himself candidly confesses, on the same footing as the vertebral theory of the skull which has occupied so many investigators since Goethe and Oken. The cephalic deficiency of the amphioxus has in our days misled many scientists. The head of an animal is the most essential and peculiar part of its organism. An infusorium has already well established head-domination. The relation of the headless somites of worms to their head, gives a correct notion of the paramount value of the latter; it is certainly not formed by coalescence of somites; it is not by chance that the sensory organs have developed in the cephalic portion. Its chemical constitution is, at the very beginning of animal life, superior to all other parts of the body.

By far the most important biological theory advanced by Dr. Clevenger is that concerning the nature of the neuroglia, which he holds to be the central organ of consciousness. He says it is "the seat of the feelings, the meeting place of the sensations, the part to which waves converge, and from which they diverge in the institution of vital movements" (p. 121). This theory is by no means scientifically proved, but, in our opinion, it enunciates, nevertheless, the greatest of all biological truths; it contains the germ of a complete revolution in the conception of the complex animal organism. We will try to make this clear. Embryology leaves unknown how the nerves are formed which unite the different parts of the body. Histology fails to discover direct communications between the ultimate sensory fibres and the initial

motor fibres. But there exists a newly homogeneous substance to which, as Dr. Clevenger puts it, "the sensory nerves converge, and from which the motor nerves diverge." This substance is the neuroglia, held by most investigators to be merely connective tissue and not nerve substance. This doubtful substance is, however, found to differ chemically in an essential manner from connective tissue, and various observers have already declared it to be of neural consistency. The strongest argument against its nervous character was advanced by Meynert. Huguenin expresses it thus: "A tissue which increases as mental function decreases, cannot be the medium of such function." It is, namely, a fact, that an ox, for instance, has more neuroglia than a man. To this objection Dr. Clevenger very aptly replies: "As differentiations occurred in a higher scale of intelligence, it is the very substance of all others to be encroached upon by organization." The relational elements, represented by the network of nerve-fibres ending in the neuroglia, increase in number as organization advances, and fill more and more the space originally occupied by the homogeneous neuroglia, which then was receiving only few relational elements. Besides, the human neuroglia is sure to be qualitatively vastly superior to that of the ox.

It has been the ambition of mechanical biologists to demonstrate an unbroken continuity between the sensory fibres and the motor fibres. Dr. Clevenger clearly recognizes what the consequence of this would be. "Consciousness would cease and the animal become an automaton indeed." Neuroglia is, in truth, the synthetical substance in which complex mental states are realized. It can be almost proved by reasoning that it must be so.

We should like to say a few words on several other ideas of Dr. Clevenger, but space forbids. So we take leave of him, fully confident that biological science will be essentially furthered by his researches.

ANNUAL MEETING OF THE F. R. A.

The twentieth annual meeting of the Free Religious Association will be held in Tremont Temple, Boston, May 26 and 27, commencing on Thursday, May 26, at 7:45 P. M., in Vestry Hall, 88 Tremont st., with a Business Session for hearing reports, electing officers, etc.

F. M. HOLLAND, Secretary.

INDIVIDUAL EXPRESSIONS.

Your paper is thus far a great success.—DANIEL G. THOMPSON, New York.
THE OPEN COURT is the best periodical I ever read.—DR. W. T. CARTER, Louisville.

I call THE OPEN COURT the highest product of our civilization in journalism.—H. F. BERNARD.

By the evidence of various omens THE OPEN COURT is destined to inaugurate a new era in the literature of free thought.—FELIX L. OSWALD.

Capital title, original and regal appearance, opulent and imposing, and promise in every page.—GEORGE JACOB HOLYOAKE, Brighton, Eng.

I want to say how excellently promising I think THE OPEN COURT. If you can keep this level its success, in the sense in which so radical a journal can be successful, is assured.—ANNA GARLIN SPENCER.

Each number is better than its predecessor thus far. Furthermore, THE OPEN COURT has a literary, philosophic aspect. It looks very inviting to the reader. Your writers will feel called upon to do their best, when they are presented to the public in such fine style.—B. W. BALL.

I am glad to see that you keep the flag of free and advanced thought flying in the United States. It will give me pleasure to send you a few articles dealing with certain aspects of some things here. * * * I purpose sending you first an article on the new ethical movement in London.—WM. CLARKE, London.

Better and better. Every student and thinker in the United States should have it. For the first time we have the right thing. I have several subscribers engaged. When you commenced the change I only looked for another *Index*. THE OPEN COURT is something wholly different, and while the *Index* had much value, this has the advantage of not being anchored to an old purpose and comparatively local one. We must have a few volumes of Montgomery collected in systematic shape. He will leave his work too fragmentary if he dies soon.—REV. E. P. POWELL.

The Open Court.

A FORTNIGHTLY JOURNAL,

DEVOTED TO THE WORK OF ESTABLISHING ETHICS AND RELIGION UPON A SCIENTIFIC BASIS.

VOL. I. No. 6.

CHICAGO, APRIL 28, 1887.

Three Dollars per Year.
Single Copies, 15 cts.

ON MEMORY AS A GENERAL FUNCTION OF ORGANIZED MATTER.*

AN ADDRESS DELIVERED ON OCCASION OF THE SOLEMN MEETING OF THE IMPERIAL ACADEMY OF SCIENCES, AT VIENNA, MAY 30, MDCCCLXX.

BY EDWALD HERING,
MEMBER OF THE IMPERIAL ACADEMY OF SCIENCES.

Translated by Dr. Paul Carus, from the Second Edition, published by Carl Gerold's Sohn, Wiess, 1876.

(Translation Copyrighted.)

If a scientist leaves behind the province of his special inquiry and takes a journey into the realm of philosophy, he may hope for a solution of the great problem which underlies the minor problems to which he has devoted his life. But he must be prepared for secretly being discredited to those of his colleagues who he knows remain quietly with the subjects of their speciality, and at the same time he will be mistrusted by the manor-born in the empire of speculation. He runs the risk of losing his reputation with the former and of gaining nothing with the latter.

The subject indeed for which I want your attention on this solemn occasion is most alluring, but bearing in mind what I said just now, I do not intend to leave the domain of natural science to which I devoted my studies and shall attempt only to gain the heights where we may enjoy a general and free survey. It will seem in the course of this paper as though I should not remain faithful to this purpose, as I shall transcend into the province of psychology. So for my own justification, let me point out how far psychological inquiries are not only an allowable but indispensable aid to physiological investigation.

The animal human organism and its material mechanism is the subject of physiology, but consciousness is a simultaneous datum, and when the atoms of the brain move according to certain laws, the inner life of our soul is woven of sensations and conceptions of feeling and will.

Everyone finds this in himself, and this, at the same time, beams forth from the faces of his fellow-beings. It breathes in the life of higher organized animals and even the most simple creatures bear some vestiges of it. Who can tell the limit of empsychosis in the empire of organic nature?

What can physiology do best in the face of such

dual aspects of organic life? Should science be blindfolded on the one side in order to better comprehend the other?

As long as a physiologist is a mere physicist—and I use the word physicist now in its most comprehensive meaning—his method of inquiring into organic nature is throughout one-sided, but it is justly so. As a crystal to the mineralogist, so a man or an animal is to the physiologist of this standpoint a mere lump of matter. Certainly an animal feels pleasure and pain, and mental emotions are connected with the material phenomena of the human body, but that is no reason why a physicist should take a different view of the corporeal existence of man, who remains to him a compound of matter subject to the same irrefragable laws as stones and plants; like a machine, his motions are causally connected with each other and dependent upon their surroundings.

Neither sensation nor conception nor conscious will can form a link in the chain of these material processes of which the physical life of organisms consists. If I answer a question, the material process is conducted from the organ of hearing by sensory nerve fibres to the brain, and must pass through it as a material process in order to reach the motor nerves of the organ of speech. It cannot, after having arrived at a certain spot in the brain enter into something immaterial in order to be re-transformed in some other place of the brain into another material process. A caravan in the desert might just as well enter into the oasis of a mirage in order to return after a refreshing rest into the actual desert.

Thus is the physiologist so far as he is a physicist. He stands behind the stage and carefully observes the gear of machinery and the movements of the actors from behind the scenes, but he misses the meaning of the whole action which is readily understood by the spectator. Now, should a physiologist never be allowed to change his standpoint?

Certainly his object is not to understand a world of concepts, but of realities. Nevertheless if he occasionally change his place of observation and look at things from the other side, or at least be told by trustworthy observers the result of their experiences, he may derive some benefit so as to better comprehend the apparatus and to learn how it works.

For this very reason psychology is an indispensable auxiliary science to physiology. If the latter did not

* Presented to the readers of THE OPEN COURT as part of his Monistic views, by Edward C. Hegeler.

heretofore use the former sufficiently it was to the less extent a fault of physiology. Psychology has been late to till her ground with the plough of induction, for only in such a soil can those fruits be raised for which the physiologist has most need.

The neurologist is thus placed between the physicist and the psychologist. The physicist considers the causal continuity of all material processes as the basis of his inquiry; the thoughtful psychologist looks for the laws of conscious life according to the rules of an inductive method and assumes the validity of an unalterable order. And if the physiologist learns from simple self-observation that conscious life is dependent upon his bodily functions, and *vice versa* that his body to some extent is subject to his will; he has only to assume that *this interdependence of mind and body is arranged according to certain laws* and the connection is found which links the science of matter to the science of consciousness.

Thus considered, phenomena of consciousness appear to be functions of material changes of organized substance and *vice versa*. As I do not wish to mislead, let me expressly mention, although it is included in the term function; thus considered, material processes of the cerebral substance appear to be functions of the phenomena of consciousness. For if two variables are dependent upon each other, according to certain laws a change of the one demanding a change of the other and *vice versa*, the one is called, as is known, a function of the other.

This does not mean that the two variables, matter and consciousness, are connected with each other as cause and effect; for we do not know anything about it. Materialism explains consciousness as a result of matter, idealism takes the opposite view and from a third position one might propound the identity of spirit and matter. The physiologist, as such, should not meddle with such questions.

Aided by this hypothesis of a functionary connection between spiritual and material, modern physiology is enabled to draw phenomena of consciousness into the domain of its inquiry, without leaving the solid ground of its scientific method. The physiologist as a physicist observes how the beam of light, the undulation of sound, the vibration of heat affect the organs of sensation; how they enter into the nerves, are transformed into an irritation of nerve fibre and conducted to brain cells. Here he loses their vestiges. On the other hand, he observes the spoken word coming forth from the mouth of a speaking person, he sees him move his limbs and finds these movements caused by contractions of muscles which are produced through motor nerves irritated by nerve cells of the central organs. Here again he is at his wit's end. The bridge which should lead him from the irritated sensory nerve to the irritated

motor nerve, is indicated in the labyrinthian connections of nerve cells, but he lacks a clue to the infinitely involved processes which are interposed in this place. It is here the physiologist successfully changes his standpoint. Here matter no longer reveals the secret to his inquiring glance, but he finds it in the mirror of consciousness, not directly but indirectly and figuratively, still it is in lawful connection with what he inquires into. Now, when observing how one idea replaces another, how from sensations conception rises, and how from conceptions *will* starts, how emotions and thoughts interweave, he will suppose that there is a corresponding series of material processes connected among each other and accompanying the whole action of conscious life according to the law of functionary inter-dependence of matter and consciousness.

After this introduction I may venture to combine under one aspect a long series of phenomena which are apparently widely separated and belong partly to conscious, partly to unconscious life of organic nature: we shall consider them comprehensively as results (*Aüsserungen*) of one and the same faculty of organized matter, viz., memory, or the faculty of reproduction.

Memory, as generally understood, is merely the faculty of voluntarily reproducing ideas or a series of ideas. But if faces and events of past days appear, although they were not called for, and take possession of our consciousness, do we not also call this, exactly as much, remembering? We are justly entitled to include in the concept of memory all involuntary reproductions of sensations, conceptions, emotions and aspirations. In doing so, memory becomes an original faculty, being at once the source and unification of all conscious life.

It is well known that sensual perceptions, if made invariably or repeatedly for some time, are impressed into what we call the memory of senses, in such a way that often after hours, and after we have been busy with a hundred other things, they suddenly return into our consciousness in the full sensual vivacity of their original perception. We thus experience how whole groups of sensations, properly regulated in their connections according to space and time, are so vividly reproduced as to be like reality itself. This shows strikingly that after the extinction of conscious sensations, some material vestiges still remain in our nervous system, implying a change of its molecular and atomic structure, by which the nervous substance is enabled to reproduce such physical processes as are connected with the corresponding psychical processes of sensations and perceptions.

Everyone may observe such phenomena of the memory of senses in his daily, even his hourly experience, although in fainter forms. Consciousness produces legions of more or less faded memorial pictures (*Erinnerungsbilder*) of former sensual perceptions. Partly they are called in voluntarily and partly they crowd in

spontaneously. Faces of absent persons come and go as pale and volatile shadows, and sounds of melodies which long have died away haunt us, if not audible, yet perceptible.

Of many things and events, especially if they were perceived only once or very superficially, merely single, unusually striking qualities are reproducible; of other things only those qualities are reproducible which have been noticed on former occasions, because our brain was prepared for their reception beforehand. They are responded to stronger and enter into consciousness more easily and energetically. Thus their ability of being reproduced increases. In this way what is common to many things and accordingly has been perceived most frequently, will be by and by so reproducible as to be easily called forth by a slight inner impulse without any exterior and real stimulus. Such a sensation which is, as it were, produced internally, for instance the idea of white, is not of the same vivacity as the sensation of white color externally produced by white light. After all it is essentially the same, but it is a weak repetition of the same material brain process and of the same conscious sensation. Thus the idea of white is an almost imperceptibly weak perception.

In this way the qualities which are common to many things separate, as it were, from them when entering into our memory. They attain an independent existence in consciousness as concepts or ideas, and the whole rich world of our concepts and ideas is constructed of these materials of memory.

It is easily recognized that memory is not so much a faculty of conscious as of unconscious life. What was conscious to me yesterday and again becomes conscious to-day, where has it been in the meantime from yesterday until to-day? It did not continue as a fact of consciousness and yet it returned. Our concepts appear on the stage of consciousness very transiently; they quickly disappear behind the scenes in order to make place for others. Only on the stage they are conceptions, as an actor is king only on the stage. As what do they continue behind the scene? For that they exist somehow we know; a clue only is required to make them reappear. They do not continue as conceptions, but as a certain disposition of nervous substance (*Stimmung der Nerven substanz*) by virtue of which the same sound may again be evoked to-day which was produced yesterday.

Innumerable reproductions of organic processes in our cerebral substance constantly join each other according to certain laws, one in its turn stimulating another. But the phenomenon of consciousness is not necessarily connected with each link in such a series of processes. Accordingly, chains of conceptions sometimes seem to lack a right connection if they are conveyed to the cerebral substance through a process not accompanied

by consciousness. Therefore, also, a long series of ideas may follow the correct logical order and organic structure, although the diverse premises, indispensable in such combination, did not become conscious at all. Some ideas emerge from the depth of unconscious life into consciousness without being connected with any conscious conception, others sink into unconsciousness without ever having been joined to conscious ideas.

Between what I am to-day and what I was yesterday, a gap of unconsciousness lies, the nocturnal sleep and it is only memory which spans a bridge between my *to-day* and my *yesterday*. Who can hope to unravel the manifold and intricately intertwined tissues of inner life if he attempts to follow only the threads as they run through his consciousness? You may as well gather your information about the rich organic life of the oceanic world from those few forms which now and then emerge from the surface of the sea merely to disappear soon afterwards into the depths of the ocean.

Thus the cause which produces the unity of all single phenomena of consciousness, must be looked for in our unconscious life. As we do not know anything of this except what we know from investigations of matter, and as to a purely empirical consideration, matter and the unconscious must be considered identical, the physiologist may justly define memory in a wider sense to be a faculty of the brain the results of which to a great extent belong to both consciousness and no less to unconsciousness.

Every perception of an object in space is a highly complicated process. For instance, a white ball suddenly appears before my eyes. It is necessary not only to convey the perception of white to consciousness, but also the circular periphery of the visible ball, moreover its globular form as may be recognized from the distribution of light and shade, then the exact distance from my eyes must be considered and from this we form an estimate concerning its size. What an apparatus of sensations, perceptions and conclusions is apparently necessary for attending to all this. And yet the actual perception of the sphere is performed in a few seconds without my becoming conscious of the single processes which construct the whole; the result enters into my consciousness complete.

The nervous substance faithfully preserves the records of processes often performed. All functions necessary for correct perception which first were done slowly and with difficulty by a constant employment of consciousness, are reproduced afterward summarily in an abbreviated way and without such intensity as to push each single link of the chain beyond the threshold of consciousness. Such chains of unconscious nerve-processes which at last end into a link accompanied with consciousness, have been called unconscious chains or perceptions or unconscious conclusions; a name which is

justifiable from the standpoint of psychology. For psychology might lose sight of the soul quite frequently if unconscious states were not taken into consideration. To a physical consideration, however, unconscious and material mean the same, and a *physiology of the unconscious* is no *philosophy of the unconscious*.*]

Almost all movements which man performs, are a result of long and difficult practice. The harmonious co-operation of the different muscles, the exactly gauged amount of work which each one must contribute to the common labor, must be learned for most movements with great trouble. How slowly a beginner at the piano finds the single notes, the eye directing his fingers to the different keys, and then how marvelous is the play of a virtuoso. With the swiftness of thought each note finds an easy passage through the eye to the finger to be performed correspondingly. One quick glance at the music suffices to make sound a whole series of chords, and a melody which has been practiced sufficiently may be played while the player's attention is directed to other subjects.

In such a case *will* no longer directs each single finger to produce the desired movements, and no close attention is needed to watch the whole execution carefully. *Will* is only commander-in-chief. *Will* issues an order and all muscles act accordingly. They work on as long as they move in their customary tracks, till a slight hint of *will* prescribes another direction.

This would be impossible, if those parts of the central nervous system which bring about the movement, were not capable of reproducing entire series of states of irritation. When they have been practiced before under a constant accompaniment of consciousness, they can be called forth, as it were, independently on a slight provocation of consciousness which is executed the quicker and more perfect, the oftener reproductions have been repeated. All this is possible only if they remember what they *did* before. Our perceptive faculty would forever remain on the lowest stage, if we should build every single perception consciously from all given single materials of sensation. Our voluntary motions would never surpass the awkwardness of a child, if in each case we should instigate the different single impulses with conscious will and reproduce all the single conceptions over again. To state it briefly, if the nervous motor system were not endowed with memory, viz., an unconscious memory. What is called the power of custom *Die Macht der Gewohnheit* is the strength of this memory.

It is memory to which we owe all we *are* and *have*. Ideas and conceptions are products of it, each perception, each thought, each motion is carried by it. Memory unites all the innumerable single phenomena

of consciousness into one entirety; and as our body would be dispersed into myriads of atoms, if it were not held together by the attraction of matter; thus, but for the binding power of memory, consciousness would be dissolved into as many fragments as there are moments.

We have seen that only a part of the reproduction of organic processes, as brought about through the memory of nervous substance, enters into our consciousness; no less unimportant parts remain unconscious. And the same may be proved from numerous facts with regard to those parts of the nervous system which are exclusively subservient to the unconscious processes of life. For the memory or reproductive faculty of the so-called sympathetic nervous system is by no means weaker than that of the brain and the spinal cord. Medical art to a great extent, makes good use of it.

In concluding this part of my investigation let me drop the subject of nervous substance for a moment in order to take a cursory view of other organic matter, where we meet with the same reproductive faculty, but in a simpler form.

Daily experience teaches us that muscles grow the stronger the oftener they are used. Muscle fibre, which in the beginning but feebly responded to the irritation of a motor nerve, works with more energy the oftener it is irritated in reasonable intervals of rest. After each single action it becomes more capable of action, it grows fitter for the repetition of the same work and better adapted to the reproduction of the same organic process. *Pari passu*, its size increases because it assimilates more than in a state of constant rest.

This is the very same faculty of reproduction the action of which is so complicated in nervous substance; here it is observable in its simplest form, and easier understood as a physical process. And what is more accurately known of muscle substance is more or less clearly demonstrable of the substances of all other organs. Everywhere we find an increased activity with adequate pauses of recreation accompanied by an increased strength of action, and organs which are used oftener in the animal household also grow in size by an increased assimilation. But this increase of mass does not only mean an aggrandizement and growth of the single cells or fibres of which the organ is composed, but also an augmentation of their number. A cell grown to a certain size divides into filial cells which inherit, in a greater or less degree, the qualities of the parental cell, and accordingly represent repetitions of it. This growth and augmentation of cells is one of the different functions which are characteristic of organized matter. These functions are not only interior phenomena of the cell substance, not only certain changes or motions of its molecular structure, but also become externally visible as a modification of form, an aggrandizement of size or a division of the cell. Thus the

* This is a thrust against Eduard von Hartmann's *Philosophy of the Unconscious*.

reproductive function of a cell is manifested also as a reproduction of the cell itself. This is most obvious in plants; the chief function of their cells is the work of growth, while in animal organisms other functions are predominant.

(TO BE CONTINUED.)

HERBERT SPENCER AS A THINKER.

BY RICHARD A. PROCTOR.

In considering the philosophy of Herbert Spencer, I scarcely know whether I am more moved by his strength and power or by his grace and versatility, until I reflect that these latter qualities are but tokens of the former. He could not pass with so firm and free a tread over so a wide a range of thought were it not for the energy of mind which has enabled him to take all thought for his domain.

Yet herein has lain the secret of the doubts which many have quite honestly entertained respecting Herbert Spencer's real position among (or rather above) the philosophers the world has known. Specialists have been apt to weigh his philosophy in parcels, comparing his biology with the biology of a Darwin or a Huxley; his physical science with that of a Thomson or a Tyndall; his mathematics with that of a Pierce or a Cayley, and so forth—not noting that with him each department of science has supplied but its due quota of material towards the building up of a philosophy which depends on all the sciences, while including also what is as yet outside the scientific domain. If we compare Herbert Spencer, in any department of science, with some chief master in that department, we find him at once less and greater: less in knowledge of details and in mastery of facts and methods; greater in that he sees outside and beyond the mere details of that special subject, and recognizes the relation of its region of inquiry to the much wider domain over which his own philosophy extends. Thus, comparing Spencer even with Darwin—the Newton of biology—we see that the biological field over which Darwin and his followers have extended their survey, is in reality but a small part of the domain over which Herbert Spencer has searched for the evidence of evolution and dissolution. If the Darwinian theory be summarized (as, indeed, in all its essential features it was summarized by Spencer himself, who independently recognized its validity) we find it presenting but a finite example, within a special department, of that universal law, unlimited alike in time and space, which Herbert Spencer presents thus:

“The rhythm of evolution and dissolution, completing itself during short periods in small aggregates, and in the vast aggregates distributed through space completing itself in periods which are immeasurable by human thought is, so far as we can see, universal and eternal, each alternating phase of the process

predominating, now in this region of space, and now in that, as local conditions determine.”

Yet one cannot but pause when contemplating Herbert Spencer's work in departments of research, to note with wonder how he has been enabled, by mere clearness of insight, to discern truths which escaped the notice of the very leaders in those special subjects of inquiry. To take astronomy, for example, a subject which, more perhaps than any other, requires long and special study before the facts with which it deals can be rightly interpreted, Spencer reasoned justly respecting the most difficult, as well as the highest of all subjects of astronomical research, the architecture of the stellar system, when the Herschels, Arago, and Humboldt adopted or accepted erroneous views. In this particular matter I had a noteworthy illustration of the justice of a remark made (either by Youmans or Fiske, I forget which) at the Spencer banquet in New York a few years ago: “In every department of inquiry even the most zealous specialists must take the ideas of Herbert Spencer into consideration.” After long and careful study specially directed to that subject, I advanced, in 1869, opinions which I supposed to be new respecting the architecture of the heavens,—opinions which Spencer himself, in his *Study of Sociology*, has described as “going far to help us in conceiving the constitution of our own galaxy;” yet I found that twelve years before, dealing with that part of science in his specially planned survey of the whole domain, he had seen clearly many of the points on which I insisted later, and had found in such points sufficient evidence to lead him to correct views respecting the complexity and variety of the sidereal system.

In Spencer's power of getting at broad general truths we find a sufficient answer to the somewhat captious objection that in matters of detail he often errs. Every specialist, I suspect, can find mistakes in Herbert Spencer's detailed references to special subjects. But his mistakes are never such as to affect the truth of his general views. One might as reasonably consider them defects in his philosophy, as one might object to a survey of some continent or country that it pictured cities, towns, and villages as circles, though not one of them is precisely circular in shape.

It is, however, as a founder of a school of ethics that Herbert Spencer is chiefly honored by those who understand and love his philosophy, in this character that he is disliked (nay, hated) by those who do not and cannot understand him.

The ethical system of Herbert Spencer in its careful discrimination between the duties men owe to themselves and those which they owe to others, is far in advance of that system, which many, calling it “Christian teaching,” fondly imagine to be a system of pure altruism. To these dreamers the system taught in

Spencer's *Data of Ethics* seems comparatively selfish—tinctured at least by what they call worldly wisdom,—in a tone implying that wisdom belonging to another world than ours must be much better for us than wisdom only useful here. One would not willingly speak with contempt of teachings which had their origin in the minds of earnest and unselfish men, anxious to teach their fellows the secret of happiness. "Come unto me, all ye that labor and are heavy laden," was their cry ages before the time of Christ, "and I will give you rest,"—and rest was to be found as it seemed to them in the love of others, in disregard of self, in forgiveness of injuries, and in taking no thought for the morrow. Poverty was no longer to be held a reason for disquiet; meekness and humility were to be regarded as chief among the virtues, and men were to deem themselves happy when their fellows spoke ill of them and they were evil entreated. Doubtless herein lay one way towards content and therefore towards happiness. The golden rule of Hillel (Confucius gave it in the same negative form) "Do not to others what ye would not men should do to you," is at least a rule by which much unhappiness may be avoided by the individual man, unphilosophical as the rule may be in itself. A kind of peace, and with it a kind of happiness, may be secured by turning the right cheek to him who has smitten the left; by yielding the cloak to him who has taken the coat; by going two miles with him who would have forced you to go with him but one. And most assuredly among men who follow this particular way to secure peace and quiet, it may be said with truth, "Blessed are the poor in spirit," for they and they alone can inherit and enjoy the kingdom of heaven—as thus imagined.

In one sense this ethical system needs no attacking. It never has been adopted or followed save by a minority so small as not to be worth considering. The very last to follow it have been those who have seemed most earnest in teaching it, and who, indeed, have doubtless been very earnest in teaching it to others, seeing that, as a doctrine for others to follow, it commends itself most to the least altruistic minds. If the ethical doctrine taught by Herbert Spencer had no other claims to our regard it would be worthy of our warmest esteem in this, that it is a system in which precept and practice can be reconciled. It is not a system which selfishly teaches unselfishness. It is not a system which teaches as a duty the setting aside of duty. It does not enjoin men to seek their own comfort by rewarding iniquity. It does not tell men that neglect of self is a virtue merely because it is a way of escaping trouble. Instead of saying, "Resist not evil," it teaches that it is each man's duty to resist wrong-doing to the uttermost in so far as lies within his power; not as moved by anger or by hate (unless where anger and hate are necessary elements of strenuous opposition to evil), but because evil

would thrive if unresisted, and few evils among men can be destroyed unless zealously opposed. So far from telling men to take no thought for the morrow, this worthier ethical system teaches that only the savage and the uncultured can be forgiven (even as young children are forgiven) for that careless disregard of the future which trusts the welfare of the thoughtless to the care of the provident.

The most characteristic feature of Spencer's moral teaching is found, however, not so much in what it inculcates as in the account it gives of the origin of rules of conduct, and especially of our ideas in regard to what is morally right and morally wrong. It is here that Spencer's philosophy has its chief interest for thoughtful minds, while also herein lies its chief defect in the eyes of the shallow-minded. He has set as the great object he has had in view throughout all his work, the application of the principles of evolution to the discussion of the rules by which the conduct of men should be guided. He has shown that all the rules by which the conduct of men actually is guided have had their origin in processes of evolution,—this being true not only of rules which seem good in themselves, but of others which seem the reverse, precisely as the attractive and preservative qualities of various forms of animal and vegetable life had their origin in evolution as certainly as those which seem unpleasant and destructive. The ferocity of the lion is as surely a product of evolution as the gentleness of the gazelle; the cowardly cruelty of the wolf came into existence through the struggle for life as surely as the courage and self-devotion of the dog, man's best friend among the animals. The sense of loyalty and duty, of good faith and justice, grows stronger as communities advance from savagery toward the better forms of civilization. To recognize this growing sense of right and duty as a product of evolution is a necessary step toward recognizing the ways by which the development of the better rules of conduct may be encouraged. But to the lower and less reasoning types of mind these views of conduct seem degrading. They would rather imagine virtue to be some ethereal essence not depending on reasoning but on the emotions, not a product of development but of some divine creative force. As reasonably might the health of body be so regarded, and all that the study of the human body has taught of the dependence of health on regimen be regarded as degrading to the higher man.

What has been the outcome of Herbert Spencer's moral philosophy? What has been the lesson resulting from his pursuance of what he has described as "his ultimate purpose, lying behind all proximate purposes," the recognition of "a scientific basis for the principles of right and wrong in conduct at large?" I take it that he has obtained the best answer yet gained by man to the vain yet ever-recurring question, "Is life

worth living?" I am not concerned to decide whether, on the whole, life is a gain or a loss. It does not seem to me that Spencer's ethical system really depends on any such decision. The results, as regards conduct, would be the same (whatever the difference in our estimate of their value) whether life were, on the whole, a blessing or, on the whole, the reverse. Hillel answered the Mallocks of his day, "It is idle to ask whether life is worth living, seeing that we live." Even so Spencer may answer those who question whether an ethical system depending on the struggle for life, is worthy of adoption. The struggle for life goes on independently of all question whether life is good or bad, of all opinion whether with time life may or may not be made better and happier. The outcome of Spencer's philosophy remains—that happiness is to be sought by each—the happiness of self as a duty to others as well as to self, the happiness of others as a duty to self as well as to them—happiness as a means, happiness as the chief end.*

It remains only that I should touch on the question of belief in a future life and faith in a Supreme Power outside ourselves, as presented by Herbert Spencer, or rather as suggested in his philosophy. That Spencer nowhere describes as known what is and must ever remain unknowable, need hardly be said. It is the essence of his mode of thinking that he strives always to see and to describe things as they are. He nowhere denies the possibility of a future life, though he shows abundantly the nothingness of the evidence on which the common belief in a future life has been based†. And, in like manner, he nowhere denies the possibility of a personal deity, though he repeatedly insists on the inherent folly of all those teachings which are based on imagined knowledge, not only of the personality of an Almighty Power, but of the nature of that power's personal plans and purposes. His whole doctrine is summarized in the thought that—

Under the appearances which the universe presents to our senses, there persists unchanging in quantity, but ever-changing in form and ever-transcending human knowledge and conception, an unknown and unknowable POWER, which we are obliged to recognize as without limit in space and without beginning or end in time.

True, as the positivist, Frederick Harrison, has suggested, there is in this thought none of that comfort under affliction which the childhood of religion found in the pretended interventions of priesthood between

man and God,—though, to say truth, the religion of humanity which positivism calls on us to accept fails no less completely (for the thought that there have been great human minds affords no comfort under great human trials). But we are to consider that when races of man are passing through childhood the comforts found in contradictory theologies are real enough as comforts, vain though they are as philosophy; while races which have reached the fullness of their manhood may safely put away childish things and man-like learn "to suffer and be strong."

FREE-THOUGHT IN ENGLAND.

BY HYPATIA BRADLAUGH BONNER.

In 1883 the state of the law relating to blasphemy in England attracted much public attention. In the March of that year Messrs. Foote, Ramsey and Kemp were tried before Mr. Justice North and a common jury for having published a blasphemous libel. They were convicted and sentenced to scandalously heavy terms of imprisonment. Later in the same year Mr. Bradlaugh was prosecuted with Messrs. Foote and Ramsey and tried before Lord Chief Justice Coleridge and a special jury. Mr. Bradlaugh was tried separately and acquitted. As in his case it was merely the question of publication and not of the matter published that was tried, no statement of the law of blasphemy was then made, but in the case of Messrs. Foote and Ramsey it was the character of the published matter and not the fact of publication that the court was called upon to decide. The Lord Chief Justice stated his view of the law in his summing up and this created such an extraordinary impression among the public and was so much questioned by some of the judges that he felt called upon to publish it in pamphlet form.

In his summing up Lord Coleridge said that the law grows and Christianity is no longer "part of the law of the land;" all through he laid down most distinctly that the offense of blasphemy is in the manner of attacking Christianity and not in the attack itself; the offense lies in the form and not in the substance. It is "absolutely untrue," he said, that the mere denial of Christianity is a blasphemous libel; the denial of the truth of the Christian religion is not alone enough to constitute the offense of blasphemy. "If the decencies of controversy be observed even the fundamentals of religion may be attacked without a person being guilty of a blasphemous libel." In concluding his summing up Lord Coleridge turned to the jury and bade them take the publications and look at them, "if you think they are permissible attacks on the religion of the country you will find the defendants not guilty, * * * but if you think that they do not come within the most liberal and largest view that anyone can give of the law as it exists now, then find them guilty."

* I repeat just here what I wrote, under the assumed name of Thomas Foster, in the pages of my monthly magazine, *Knowledge*, and what my friend the late Prof. E. S. Youmans reprinted, not knowing I was the author, in the *Popular Science Monthly*, where possibly some readers of these pages may have noticed the passage. A somewhat amusing result of the appearance of the Foster papers was that I, as Richard A. Proctor, was requested by an admirer of Spencer (the Rev. Minot J. Savage) to meet myself as Thomas Foster, at a Spencerian gathering.

† Common opinion, in matters depending on individual judgment, is absolutely certain—where decision is difficult—to be common error.

Such an expression of opinion on the law relating to blasphemy coming as it did from so high an authority as the Chief Judge of England, caused much discussion among both the learned and the unlearned, and in the following March an article on the subject appeared in the *Fortnightly Review*, from the erudite pen of Mr. Justice Stephen. Mr. Justice Stephen while admiring the summing up, feared "that its merits may be transferred illogically to the law which it expounds and lays down, and that thus a humane and enlightened judgment may tend to perpetuate a bad law by diverting the public attention from its defects. The law I regard as essentially and fundamentally bad."

Mr. Justice Stephen accepted Blackstone's definition of the offense of blasphemy* as accurate, and quoted from several of the leading authorities in support of his opinion. He disliked the law profoundly and also so thoroughly that in order that other people might see how bad it was, he determined to state it "in its natural naked deformity." He pointed out that a large part of our most serious and most important literature of the day is illegal; the selling or lending of Comte's *Positive Philosophy*, of Renan's *Vie de Jésus* is punishable by fine and imprisonment. He took a particular instance to bring the revolting nature of the law home to his readers. "The late Mr. Greg," he said, "was not only a distinguished author but an eminent and useful member of the Civil Service. I suppose he was educated as a Christian, and no one could have a stronger sympathy with the moral side of Christianity. In every one of his works the historical truth of the Christian history is denied, and so is the Divine authority of the Old and New Testament. If he had been convicted of publishing these opinions, or even of expressing them to a friend in private conversation, his appointment would have become void and he would have been 'adjudged incapable and disabled in law to hold any office or employment whatever;' in a word he would have lost his income and his profession. Upon a second conviction, he must have been imprisoned for three years and incapacitated, among other things, to sue or accept any legacy. About this there neither is nor can be any question whatever." Mr. Justice Stephen concluded his able article by urging the repeal of the blasphemy laws.

The learned judge was followed by other less able writers on both sides, but it was largely felt that while Lord Coleridge had given a "humane and enlightened" presentment of the law, Mr. Justice Stephen had given an uncomfortably accurate one. This view has been authoritatively taken by the Queen's Bench division of

the High Court of Justice in the recent case of Pankhurst vs. Thompson, in which it was held by Mr. Baron Huddleston and Mr. Justice Manisby that a mere denial of Christianity was an indictable offense without reference to the manner of the denial.

Consequently Mr. Courtney Kenny, M. P., has introduced a bill into the present Parliament on lines drafted by Mr. Justice Stephen, for "the abolition of prosecutions against laymen for the expression of opinion on matters of religion." The bill is powerfully backed by Mr. Illingworth and Mr. Crossley, leading Nonconformists, and Mr. Bernard Coleridge, son of the Lord Chief Justice, whose recent visit to the United States will have made his name familiar to the American public. Mr. Courtney Kenny is himself a most able man, and was for a long time law lecturer at Downing College, Cambridge. When the bill gets into committee there is one clause which will, without doubt, be opposed by some of those who are otherwise friendly to the bill, probably by Mr. Bradlaugh at least. The clause to which I refer is the third, which provides that "any person who, with the intention of wounding the religious feelings of any person or persons, shall in any public place utter any word, or make any gesture, or exhibit any object within the hearing or sight of any person or persons, whose religious feelings are likely to be thereby wounded, shall be guilty of a misdemeanor; and on being convicted thereof, shall be liable to fine or imprisonment, or both, as the court may award, such imprisonment not to exceed the term of *one year*."

This provision is borrowed from the Indian code, and there is no doubt that it has worked very well in India, where there are Mohammedans, Hindoos and other opposing sects, and where it has prevented the Christian missionary from making himself too offensive to the natives. But it is not at all likely that such a clause would work well here in England, where the circumstances are so entirely different; on the contrary it opens out the way to much possibility of evil.

The bill is down for its second reading for July 1, but the coercion legislature for Ireland introduced by the government, and the debates on the never-ending Irish difficulties take up so much of the time of the House of Commons, that private members' bills have very little chance this session. At present, therefore, Free-thinkers and Unitarians still remain under a law which threatens them with fine and imprisonment whenever they unburden their minds on the subject of religion. It is, of course, a well-known fact that Atheistic and Unitarian publications are issued daily, and yet they are not prosecuted. So much obloquy attached to the prosecutions of 1883, that they are not likely to be indulged in very often; nevertheless the law is there to enforce whenever there is the evil will to enforce it. Before the Foote and

*The fourth species of offense, therefore, more immediately against God and religion, is that blasphemy against the Almighty by denying his being or providence, or by contumelious reproaches of our Savior Christ. Whither also may be referred all profane scoffing at the Holy Scripture or exposing it to contempt or ridicule."

Ramsey prosecutions people said the law was obsolete, and pooh-poohed the idea of it being pleaded in a court of law to-day; but it was pleaded, and by its minister, Mr. Justice North, dealt out to Mr. Foote the severe penalty, the savage punishment of twelve months' imprisonment.

Another important bill affecting the position of Free-thinkers in England is also before the present Parliament, namely the bill "to amend the law as to oaths." It consists merely of three short paragraphs which are as follows:

1. Every person shall be permitted to make his solemn affirmation instead of taking an oath in all places and for all purposes where an oath is or shall be required by law, which affirmation shall be of the same force and effect as if he had taken the oath; and if any person making such affirmation shall wilfully, falsely, and corruptly affirm any matter or thing which, if disposed on oath, would have amounted to wilful and corrupt perjury, he shall be liable to prosecution, indictment, sentence and punishment in all respects as if he had committed wilful and corrupt perjury.

2. Every such affirmation shall be as follows:

"I, A.B., do solemnly, sincerely, and truly declare and affirm," and then proceed with the words of the oath prescribed by law, omitting any words of imprecation or calling to witness.

3. This Act may be cited as the Affirmative Act, 1887.

This bill was introduced on the first day of the Parliamentary by Mr. Charles Bradlaugh and has been down for its second reading a great many times already. It has, however, a host of enemies to contend with, first there is the common enemy to all home legislation—the Irish coercion measure with all its attendant troubles; then the Oaths Bill has its own particular religious enemies; Roman Catholic and ultra-Protestant join hands in opposing the Atheist. Mr. Bradlaugh puts his bill down every night in the hope that it may come on but as regularly as he puts it down so regularly is it "blocked" by Mr. de Lisle, a Roman Catholic, or by Mr. Johnston, an ultra-Protestant and violent opponent of Mr. Gladstone's Home Rule Bill for Ireland, or some other blind intolerant zealot. There is a rule in the House known as "the half-past twelve rule" which provides that opposed measures shall not be taken after half-past twelve at night, and when a member goes through the form of putting his name down as opposer to a bill, he is said to have "blocked" it because he has prevented it from being taken after half-past twelve. It is exceedingly unlikely that an ordinary bill would come on before that hour unless there should be some break-down in the appointed business for the night.

The Oaths Bill is backed by Sir John Simon, a Jew; Mr. Courtney Kenny, whom I have already mentioned as the introducer of the bill against blasphemy; Mr. Burt, the trusted representative of the Northumberland miners; Mr. Coleridge, the son of the Lord Chief Justice; Mr. Hlingworth, a very prominent English Dis-senter; Mr. Richard, leader of the Welsh Noncon-

formists and Mr. Jesse Collings. Sir John Simon had charge of the Oaths Bill in the former Parliament, before Mr. Bradlaugh was permitted to take his seat in the House of Commons, but his bill was far less comprehensive than the present one. Mr. Hopwood, Q. C., now Recorder of Liverpool, was the first person to have charge of the bill which arose out of the objections made for political purposes by the Tory party, first to Mr. Bradlaugh's taking an affirmation of allegiance when he entered the House as duly elected member for the borough of Northampton, and next, to his "profaning" the oath. The judges decided that Mr. Bradlaugh had no right to affirm and the Tories, supported by a number of weak Liberals and by the whole of the Irish party, determined he should not take the oath. However, bigotry—whether real or assumed for political purposes—was vanquished at last, and as everyone knows, Mr. Bradlaugh is now sitting in the House doing his full share of work.

MIND-READING, ETC.

MINOT J. SAVAGE.

The editors of this paper ask me for an article containing "the results of your observation and experience in regard to mind-reading."

Now to be suddenly called on for all one knows about any subject is somewhat embarrassing. One has the comfort, to be sure, of feeling that it will not take him long to tell, and the cost of paper will be so much less than it would be should he attempt to tell all he does *not* know. But still there are so many things one half knows, or thinks he knows, though as yet he can give no scientific proof. Then one wants to give so many reasons for not knowing more, or for opinions that as yet are not quite certain. No, it is no easy task to tell even the little that one knows.

Then there is another thing that concerns these investigations on the border-land, that the members of the Society for Psychical Research do not take sufficient account of. Through circulars, and in other ways, the committees call loudly for evidence, asking all who have any facts to submit them for examination and judgment. But it has happened, through my known interest in and sympathetic treatment of these questions, that large numbers of cases have come to my knowledge that the Society will never hear of. And the reason for this ought to be noted. And public investigators ought to take account of this reason. No one should suppose that nothing is going on because it is not submitted to the inspection of those who call loudest for it.

The reason for keeping these things back is two-fold:

1. Many of the things that occur are of a private, personal character. It is quite natural that this should be so. Such things are held as sacred. People would

as soon publish their private griefs as give these things to the world.

2. Then the attitude of the investigators is often a most unfortunate one. It has always seemed to me that it is absurd for a man to investigate a thing, the very *possibility* of which he denies before he begins. If a man does not believe of course he gives no testimony in favor. If he does believe he is treated as a "crank" and his testimony is ruled out. So long as one knows that he is to be met in this spirit—that he will be looked on as a lunatic, to be treated with a superior kind of pity and tenderness, or with the blunt brutality that says, "You may mean all right, but you are a fool"—so long circulars asking for information will be likely to find the waste-basket.

I have taken the liberty of heading this article "Mind Reading, *Etc.*" I mean that the "*Etc.*" shall be the larger part of it. Or, to speak more accurately, I wish to make it an open door through which I may go out and wander through this border-land at will.

That mind-reading, thought-transference, or something quite as inexplicable is true I know. My purpose in this article then will be to make it clear that here is a problem that challenges the attention of rational people. I wish, I say, to make so much clear if I can. And yet I am not ready to publish more than hints or fragments of facts that lead me to express the certainty to which I have given utterance. But the principal thing that reasonable people need at present to know is that there are facts that as yet find no place in our generally accepted scientific theories.

The present condition of affairs is a scandal both to science and philosophy. Here are thousands of sane persons asserting that wonderful psychic facts are of daily occurrence. Their statements are either true or false. If false, here is at least a huge delusion from which it is worth while that these people be set free. The statements of these persons are accepted without question on all other subjects. And these things are not like one's theological opinions, that are taken on faith, and that those who disbelieve them are accustomed tacitly to ignore. They are offered as facts that are open to investigation. I am aware that a few persons, in a half-and-half sort of way, are investigating, but it seems to me that something more than this is needed. If these asserted facts take place then they change our scientific theories of human nature and human destiny. If not then there are other and more important things to engage our thought and time. I believe then that this is a question worthy the most serious attention.

But my experience with so-called "scientific" investigators leads me to think that, as there are "odds in deacons," so there are *odds* in "scientific" investigators. Some of them *are* scientific; and others are such bundles of prejudices and preconceptions that their

claims to be scientific in these inquiries are simply ludicrous. Their demands and their proposed tests seem to me as absurd as would be the position of a man who would not believe in electricity because it would not ignore its own laws and, just to please him, work through a rail fence instead of a wire.

I plead then, not only for an investigation of these things, but for a little unbiassed study of conditions,—the same as would be rational in other departments of study.

Now for a few hints as to the kinds of facts that need to be explained.

The mind-reading committee of the English Society for Psychical Research thinks that the fact of thought-transference has been established. Their experiments, however, are before the public; and all those interested can review their work and pass judgment on it at will. The thoroughness of their work has been questioned on this side the Atlantic, and their conclusions impeached. I am inclined, however, to accept the fact itself as established. But my acceptance is based not so much, perhaps, on the evidence they offer, as on the fact that I am sure that things quite as wonderful have occurred in my own experience. When once a general truth is established in one's own mind, he does not require so much evidence as he did before to lead him to accept some special case that may be reported.

I was a good deal impressed at one time, with the so-called mind-reading experiments of Mr. W. Irving Bishop. I have had many private experiments with him that seemed very wonderful. But Mr. Montague (one of the editorial staff of the *Globe* of this city) has duplicated nearly all of Mr. Bishop's wonders, and claims that he does it by means of the unconscious guidance of the subject. I do not feel quiet sure that all of Mr. Bishop's work can be explained in this way. And yet I do not rely on any of these things as giving satisfactory proof of actual thought-transference.

I will now give a few brief hints of some occurrences that, to my mind, establish the fact that there are some things for which our present theories of man and nature furnish no explanation.

The facts of hypnotism are somewhat familiar to all those who have given any attention to this class of studies. But not all these, I think, are aware that some hypnotic subjects are clairvoyant and can see and report things with which even the operator is not acquainted. During private experiments in my own study, strange powers have been exercised, for which I know of no explanation.

Then, as the result of private experiments, I am sure of the manifestation of some force that is able to move physical objects. The circumstances have been such that no muscular pressure, conscious or unconscious, could account for the movements.

I am acquainted with no end of cases where people have been told things that the persons who told them (or through whom they were told?) did not know.

More than once I have had a person hold an unopened letter in her hand and tell me about the one who wrote it in the most detailed and unmistakable way.

In sitting with a personal friend, *not* a recognized or public "medium," I have, over and over again, been told things that it was impossible the friend should ever have known.

And—most unaccountable of all—I have had this same friend tell me of things that were occurring *at the time* in another State, and concerning which neither of us could, by any possibility, have had any knowledge. These have been so personal and peculiar as to make all theories of guess-work or coincidence so extremely improbable that *impossible* seems the proper word to use.

To tell the story of my experiments in any fulness would require a volume. Are these things mind-reading? Are they telepathy? What are they? That they are facts I know.

FREDERICK DOUGLASS IN PARIS.

BY THEODORE STANTON.

During the recent sojourn of Mr. and Mrs. Frederick Douglass in Paris it was my good fortune to meet the celebrated orator and reformer on many and different occasions, and I propose in this letter to report discreetly some of his sayings and doings.

Mr. Douglass, even amidst the new attractions of an European capital, never seems to forget that he is the champion of an oppressed race. "One of the reasons why I so much like France and the French," he said to me one day, "is because the negro is not the butt of ridicule here as he is in the United States. There are no minstrel shows in Paris, and at the Louvre and Luxembourg Galleries and elsewhere I find that the public treats the African as an equal fellow-being. The occasional bandana is here considered one of the picturesque features of the boulevards and classed with the becoming headgear of the natty peasant girls from the provinces. No Frenchman ever snickers at the black face that sets off the parti-colored handkerchief." When Mr. Douglass stood in front of Gustave Doré's statue of Alexandre Dumas, on the Place Malesherbes, the artistic qualities of the monument failed to move him. He remembered how this son of a negress had never spoken a word or written a line in defense of his mother's race. "Let us go and see the statue of Lamartine," he exclaimed one afternoon; "he said some fine things." And when we reached the Place Lamartine Mr. Douglass cared but little for the masterly way in which the sculptor has grouped the legs of the chair, dog and man; his mind was dwelling on the fact that the

poet-President signed in 1848 the decree that freed all the slaves of the French colonies, and his eyes were attracted by the resemblance of Lamartine's face to that of Lincoln.

Probably his two meetings with M. Victor Schœlcher, the William Lloyd Garrison of France, left a deeper impression on Mr. Douglass' mind than any other event that happened to him while in Paris, for it was Senator Schœlcher's long and indefatigable efforts that finally secured the abolition of negro servitude in the French possessions. I was present when this grand old octogenarian recounted the history of his life work, which seemed to carry Mr. Douglass back to the *ante bellum* struggle in the United States. M. Schœlcher then asked many questions about the anti-slavery conflict in our country, with which he is remarkably well acquainted, and criticised severely Mr. Lincoln's course. Thereupon Mr. Douglass defended Mr. Lincoln, explained to M. Schœlcher the difficult position in which the President was placed, and closed his apology with these words: "Mr. Lincoln was better inside than outside."

Mr. Douglass tells many interesting anecdotes of Lincoln. The following one he very naturally enjoys recounting: During the war Mr. Douglass was paying his respects to the President at the White House, when Governor Buckingham, of Connecticut, was announced. Mr. Lincoln thereupon called out to the servant in his high-pitched tone: "Tell Governor Buckingham to wait; I want to have a good talk with Mr. Douglass." "And we did have a good talk," said Mr. Douglass as he told us the anecdote the other day, "for Mr. Lincoln kept me half an hour longer. This circumstance made an impression on me, for not often in my life have I kept a Governor waiting, and a 'War Governor' at that."

"The delegates to the famous Union Convention held in August, 1866," continued Mr. Douglass, "didn't treat me like Mr. Lincoln. I was sent to that Philadelphia gathering to represent the city of Rochester, but before reaching my destination I was met by a committee that boarded the train and begged me not to enter the convention. They dwelt upon an important election then pending in Indiana, spoke of the conservative delegates to the convention, and expressed fear that the presence of a colored man would give Indiana to the Democrats and send home a certain number of the members. But I declined to return to Rochester, being convinced that the fears of the committee were not well founded, and results proved that I was correct. When we were forming in procession to march to the hall, I noticed that everybody was afraid of me. Even Henry Wilson was reserved. General Butler was almost the only man who gave me a hearty welcome. As the delegates paired off and fell into line, it looked for a moment as

though I should have to walk by myself. But it was not the first time that I had stood alone and so I was not troubled on this score. As the band struck up and the volume moved off an arm was suddenly locked in mine and I found Theodore Tilton at my side. And I must add that all through the streets of Philadelphia it was Theodore Tilton and his humble companion who awakened the most enthusiasm and cheers."

When Mr. Douglass came to Paris it was but natural, therefore, that he should hunt up his old friend, and the tall forms and silvered hair of Frederick Douglass and Theodore Tilton have, during the past autumn, attracted scarcely less attention on the boulevards of the French capital than their well-known faces did just twenty years ago on the streets of the Quaker City. They have gone together to St. Cloud, to the Palace of the Archives, to the Trocadin Museum and to many of the other interesting spots in and around Paris. "You should have seen our astonished Frederick on the top of Notre Dame," wrote Mr. Tilton to me last November. "Coming unexpectedly into the grotesque presence of the grinning gargoyles! In fact these fantastic figures are the merriest company of imps, demons, goblins and good devils that I have met in this cheeriest of all cities. The true *Comédie Française* is on top of Notre Dame!"

Although Mr. Douglass holds liberal views on religion, he did not confine his church-going while in Paris to visits paid to the outside of the edifices. He was present at a grand mass in Saint Eustache, but felt forced to leave before the end of the ceremony. "The superstition made me sad," he remarked, in extenuation of his conduct. He could, however, sit through Father Hyacinthe's service Sunday after Sunday, probably because he was held by the fascinating oratory of this wonderful divine. "I think I am Father Hyacinthe's most attentive listener," Mr. Douglass said to me after his first Sabbath in the little chapel in the Rue d'Arras; "and he appears to be of the same mind, for I notice that he keeps his eyes on me throughout most of his sermon. I apprehend his thoughts, although I do not understand his language, which proves that he is a true orator." Father Hyacinthe finally learned who was this rapt worshiper, and invited him to tea. The next morning we were seated in M. Schœlcher's study waiting for the senator, when Mr. Douglass arose, stood behind his chair, and began to develop his views on revealed religion with a clearness of thought and a flow of language that was really remarkable. My only regret was that the audience was so small. "I cannot understand," he said, among other things, "how Father Hyacinthe stopped half way in his religious evolution, and when I see him still going through the service of the Roman Church, I reluctantly ask myself, can it be that he believes in this?" "No, of course he doesn't," interrupted

M. Schœlcher, who entered at this point; "it is only a sentiment, just like Victor Hugo's idea of immortality. We were standing one day at his front window discussing this question of a future life," continued M. Schœlcher, who is a confirmed atheist, and was a close friend of the dead poet, "when I said to him: 'Now, what would be the use of saving the soul of that stupid cabman passing there?' 'None, whatever,' answered Victor Hugo; 'it is only such as you that I expect to see in the next world.' I venture to say that Father Hyacinthe holds much the same view, if he were to express what is in the bottom of his heart." "Father Hyacinthe said to me yesterday," interrupted Mr. Douglass, "when I told him that I was coming to see you this morning, 'Well, you are going to meet a man who doesn't believe in heaven himself, but makes other people believe in it.'"

Mr. Douglass delights to revert to the anti-slavery struggle, and his anecdotes of Phillips, Garrison and the other leaders in the abolition movement are very entertaining. We were crossing the Pont St. Michel one afternoon, when Mr. Douglass stopped in the middle and looking down into the Seine, said: "When I came up North from slavery I found the abolitionists declaring the federal constitution to be a covenant with the Evil One. But, as soon as I got my eyes open to the situation, I felt that we could make out a case standing on the constitution. So I differed with them and immediately found that I had got myself into trouble. Mr. Garrison was especially hard on me. If you once agreed with Garrison and then differed with him, your position was a difficult one. But later we became good friends again and I also had the satisfaction of seeing the abolitionist come round to my way of thinking."

We were passing through the Passage de Choiseul one evening, feasting our eyes on the rare books that abound in the little shops when Mr. Douglass espied a second-hand violin exposed for sale in one of the windows. We entered, he asked the price of the instrument, looked at it carefully, twanged the strings and, as we went out, thanked the merchant for his politeness. "Why, do you know anything about the violin?" I asked of Mr. Douglass. "Certainly," was his reply; "I have a good violin at home and often play on it. I must tell you the first time I ever took up this instrument. It was during my sojourn in London directly after my escape from slavery. I was in very low spirits, and as I was walking the streets of the vast English capital in a most dejected mood, I noticed a violin in a shop window just as I did that one a moment ago. In the former instance, however, I purchased the instrument, returned to my hotel, where I remained four days, shut up in my room, striving to become familiar with my new friend. And when I came forth again, I had played myself in tune."

A few nights after this conversation I met Mr. Douglass at a little musical party where an amateur quartette performed. Having never seen him with a violin under his chin, and remembering what had happened and what was said in the *Passage de Choiseul*, I hinted that Mr. Douglass be invited to play something. He at first declined, but, being pressed by the company, finally took up the violin and rendered some plaintive Scotch airs with much spirit and feeling. Before we separated, one of the guests struck up the "Marseillaise," and then it was that Mr. Douglass' passion for music displayed itself. He rose from the sofa, made his way to the piano, and joined in this majestic national anthem just as he must have done in the war days when "John Brown" was being sung.

Mr. Douglass left Paris with considerable regret, for he had found here many appreciative friends, both among the English-speaking exotics and the indigenous French. And he had begun to take a strong liking to its people, its customs, its streets and its public monuments. In fact, so deep is this attachment for the French capital that he intends to return here in the spring, when he shall have completed his tour in Egypt, where he now is, and have visited Northern, as he has just done Southern, Italy. Mr. Douglass has seen Paris in its somber autumnal and winter dress, and now he quite naturally wishes to look upon it in its proverbial summer brightness.

Paris, April.

DOES AGNOSTICISM PRODUCE BETTER RESULTS THAN CHRISTIANITY?

BY W. L. GARRISON, JR.

I am often led to speculate on the results following different theological beliefs. The prolonged battle for religious freedom which gained its great impetus in the Lutheran reformation, has in our generation and country nearly reached its culmination. The right of rejecting inherited religious dogmas has by the aid of science and free inquiry been established. Where, thirty years ago, to avow disbelief in a Supreme Being or in immortality was to accept social ostracism, intellectual skepticism is now no bar to preferment in society or public life.

The right of unbelief is as sacred as that of crediting traditions, and the victory is well worth the fearful cost. The crimes perpetrated in the name of religion match any committed for selfish ambition or national aggrandizement. But now we can be Baptists, Methodists, Presbyterians, Unitarians, Spiritualists, Catholics or Come-outers, having no formulated religious ideas at all, or we may deny vehemently any foundation for a supernatural belief, and still keep our flesh from the pincers and the flames, retain a respectable character, be accepted as good citizens and trusted as honest men.

It is a fortunate period of the world's history to live in. The inquisition has no terrors for the dissenting soul, and no evangelical church prays to-day that God will put a hook into the jaws of a liberal preacher, as was besought by Park Street Church, in the case of Theodore Parker. Let us be thankful.

Having achieved liberty what shall we do with it? "The virtue lies in the struggle, not the prize." It is the *right* to declare our unbelief, if we hold it, not the unbelief itself that is precious. Every sect was evolved in trials and persecution, and to cling to a heresy under fire was a test of manhood and moral courage. But once successful the touchstone lost its power. Each faith has its saints who deserve their canonization, but traditional accepters of dearly established creeds are not of necessity worthy of embalming.

Free religious ideas and agnosticism having won toleration, it argues no saving grace or virtue to proclaim them now. They take their place in the category of other sects or creeds, and no cross is incurred by professing them. They are as likely to be the shibboleth of selfishness and ambition as church membership has been heretofore. The vital question for one anxious to embrace a code of faith is, "Which produce the best lives?" We must judge the tree by its fruit, and, comparing ourselves with followers of the creeds we have outgrown, can we affirm that our larger liberty has made us more the children of light?

A healthful mode of comparison is to study the personality of the workers in the reforms of the day. It is our belief that human progress has always been cherished and advanced by the few laborers outside the church more than by the many professors within it. So, for the practical exemplars of religion, we turn our eyes naturally to the humanitarian efforts which agitate society.

In benevolent attempts to relieve personal suffering, religious societies have never been wanting. On the contrary, they have been active. But their indifference or antagonism may safely be counted upon when radical instead of palliative measures are aimed at. Radical reform interferes with established customs and interests. These the church considers it her function to preserve, or at least to shield. She follows and claims the fruit of the unselfish sowers of the seed. The ripened sheaves are gathered by her without compunction. Having persecuted the heretics she has ended with claiming the merit of the accomplishment and when too late for the reformer, appropriating him as a saint.

The never-ending battle for reform goes on as heretofore. The great temperance movement; the cause of woman's political equality, the most far-reaching in its results of any since the world began; the Indian problem; the agitation for free trade and the abolition of the blighting tariff; the problems of labor; the questions of

social purity, capital punishment, prison reform; the sublime advocacy of universal peace; in these and kindred labors, are the men and women theologically emancipated in the van? These are the touchstones of theological belief.

Alas, men and brethren, in the temperance movement it is necessary to acknowledge that we are overshadowed by earnest members of the church. The wonderful Women's Christian Temperance Union, organized and wielded so masterfully by its able leaders, adds little glory to our faction. Indeed the agnostics who are on the side of the brewer and the distiller are shamefully frequent. In the woman's cause we have no reason to blush. The ranks would miss the free religious allies. And yet it has room for more of them. On the subject of peace they show no superior enlightenment over the professed followers of the Prince of Peace. The noble Russian, Tolstoi, who gets his light and fervor from the New Testament, preaches anew the rejected gospel of non-resistance, the one distinctive doctrine that distinguishes Jesus from the messiahs of all other religions. Where are the anti-Christians who reach so high a level as his?

In the other social movements, who can assume the workers to be distinctively evangelical or otherwise? Henry George wears no sectarian stamp and may perhaps, be claimed by liberal thought. It is the custom to sneer at and belittle him, chiefly by those who never read his writings. The generation is making up a judgment of him which it will have to reverse, unless unselfishness, devotion to principle, deep-thinking, the superb courage of unpopular convictions, and a spirit of humanity that underlies all, have ceased to be admirable. And this I say without being able to agree altogether with many of his ideas. But men who dare to speak as they truly think, are far too rare to be hastily passed by. But to match him comes that bold priest, Father McGlynn. Theology, therefore, inspires neither.

If free religion is to stand for any more than a transient form of speculation, it must crystallize into practical work. It must leave its impress not in shadowy metaphysics, but in the work of human elevation and brotherly love. Until it does that it is unbecoming to assume superior wisdom or pride itself on its liberal views. Emancipated from a creed, we have yet some distance to travel before we shall enter fully into that temple which, transcending all creeds and professions, asks only of its worshipers that they love to eternal goodness and show it by helping their fellow men.

Let us not listen to those who think we ought to be angry with our enemies, and who believe this to be great and manly. Nothing is more praiseworthy, and nothing more clearly indicates a great and noble soul, than clemency and readiness to forgive.—*Anon.*

SARA A. UNDERWOOD,

ASSOCIATE EDITOR.

The leading object of *THE OPEN COURT* is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to *THE OPEN COURT* should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, APRIL 28, 1887.

THE RELATION OF SCIENCE TO MORALS.

Knowledge increases in usefulness as it becomes classified, in which form it is called science. Viewed separately, without reference to their relations to one another and to the well-being of man, facts are of but little value to anybody. Only when they are classified and their relations are grouped, and the processes called laws which they indicate are understood, can we use them to the greatest advantage. Without these generalizations there can be no comprehensiveness of thought, no far-reaching plans or projects, no great intellectual or moral achievements. Man's "pre-eminence over the beast" consists not merely in a special faculty, but in his greater knowledge, and in his greater capacity to acquire knowledge of his manifold relations to his environment. The coming man, compared with the man of to-day will probably be an intellectual and moral giant; larger knowledge of himself and the ways of nature will be a distinguishing characteristic. True, mere

knowledge is no sure guarantee of moral character. The results of ages of moral savagery ingrained in the mental as well as in the physical constitution, may be more powerful determinants of conduct than the intellectual attainments of the individual, added to the inherited tendencies derived from a few hundred years of civilized life. Violence of passion, inborn selfishness, or lack of sensibility even, may blind a man of great knowledge to the rights, or render him indifferent to the sufferings of his fellow-men. A large knowledge of many subjects is often found in minds that are lamentably ignorant of others which have a more direct relation to conduct. Many, too, have a theoretical knowledge of matters of which they are so destitute of practical knowledge, that they are unable to realize their real significance. Man has been learning through many centuries, during which the horizon of his thought, although gradually expanding has been, compared with his outlook to-day, very circumscribed. Since it is impossible to sever himself from the past, he cannot divest his mind at once of ancient beliefs, much less of their *results*; nor can he in a day make new channels of thought, or think or act in a manner wholly consistent with newly acquired knowledge, when it conflicts with beliefs that have profoundly influenced the thought and life of his ancestors from whom the characteristics he possesses have come down to him as a legacy. We should, therefore, expect on *a priori* grounds that disparity between intellectual attainments and moral character, conspicuous illustrations of which can be found in any community.

It is, however, none the less true that the only natural basis for hope in man's moral progress is in his undeniable capacity for knowledge,—to which, in the region of the knowable, no limit can be set,—and his ability to methodize his knowledge and make it minister in countless ways to his wants and welfare.

The whole tendency of modern civilized life is to repress the savage instincts and traits of man's nature, and to develop and intensify those qualities of head and heart which appear in a late period of his development, even now too often reduced to the weakness of their nascent condition temporarily, by the brutality of the savage, who attests his presence and reasserts his control in the civilized man of the nineteenth century. Fortunately the influence of constantly increasing knowledge is eradicating the results of ages of ignorance in human character; and when men shall become yet more emancipated from their bad inherited tendencies, they will be able not only to discover truth more easily, but to conform more readily to the moral relations which it reveals. Inconsistencies between conviction and conduct must become less general, and creed and character more in harmony with each other.

If a man believes that a certain course of conduct is

for his best interests, judged by his highest moral standard, he will follow that course in proportion as he is unhampered by traits, beliefs and tendencies which dominated in those ages of savagery in which men, not understanding their relations to each other, were short-sighted, acted from impulse and were strangers to the higher sentiments and the nobler motives which determine the conduct of the best men of to-day.

That men are coming to understand more fully than they did in the past that virtue is wisdom and vice is folly can be clearly shown. That they now understand better than they did formerly what constitutes a virtuous character and a vicious character, is sufficiently evident from a comparison of the ethical views of the best teachers of this age, with the best among the ancients. That men live more morally now than in the past is evident from a comparison of this age with that of Pericles or Augustus, of Elizabeth or George III. That knowledge is increasing needs no proof. It is reasonable, therefore, to expect moral progress in the future.

The belief is now very general, and likely to remain a long time with a certain class, that the only true support of morality is afforded by theology. This belief has plausibility for the masses because a portion of man's toilsomely acquired knowledge has been embodied in, or connected with theological dogmas. What man has discovered in himself he has contemplated in God. The elementary facts of anthropology, long before they were systematized in a real science, were made the basis of the pseudo-science of theology, the assumptions of which stand out prominently in the history of the race; while the unrecorded thoughts, hopes, fears and aspirations of the people out of which grew these dogmas, are little considered or entirely disregarded.

Conduct, influenced far less by theological beliefs than is commonly supposed, is determined by character,—the product of factors furnished by the countless millions who have lived and died,—and by surroundings which are continually modifying character. Every observation, discovery and invention, and every act in the life of man that has helped him to understand his relations, to enlarge his powers, to improve his physical condition, have contributed to the moral progress of the race.

With multiplied relations and increased complexity of social life, man is placed in a greater variety of positions and subject to far greater moral strain. The existence, therefore, in civilized society of a multitude of evils unknown to barbarians, is an unavoidable incident in the evolution of institutions and the growth of industrial pursuits that distinguish civilized from savage life. According to statistics, Protestant districts in Germany exhibit more fraud than Catholic districts; and the reason of this, evidently, is that more business is done in the former than in the latter. In Catholic districts the

excess is in acts of violence, because in those districts are more ignorance and poverty.

The more complex become man's relations, the greater the necessity and the greater the power of resisting temptation and yielding to the discipline of personal sacrifice for the general good. The moral sense, too, is strengthened, and the power of the will in restraining the selfish propensities and in making conduct conform to the conceptions of duty is augmented. The more man knows of science, the more clearly must he see and the more fully must he realize that morality is supreme over everything else, because upon its embodiment in character and conduct depends, more than upon anything else, the well-being of the race.

"AN UNCONVERTED HEATHEN."

It was with heartfelt regret that we read a few days ago of the death on the 25th of February, at Poona, India, of Dr. Anandabai Joshee, her death occurring less than a year after her successful graduation as an M. D. from the Women's Medical College of Philadelphia, where she had taken a three years' course of study.

One afternoon in May last, we waited in the receiving room of the New England Women's Hospital, at Boston, Mass., with a little flutter of admiring curiosity the coming of Dr. Joshee, for we had never met a Hindu woman and the known facts of this woman's life were sufficient to awaken admiration; for only a brave, self-sacrificing and independent soul could have left as she had, husband, home, kindred and native land, to dwell among those of a different race, color, language, nation and faith, in a strange land and an uncongenial climate for the purpose of becoming better fitted to elevate intellectually and alleviate physically the condition of the women of her own race—and she so young—and a woman!

This feeling of admiration was deepened when there presently entered a graceful, child-like creature, the lustrous eyes of whose dark grave face sought those of her visitor in quiet scrutiny. The occasion of the call was to invite her in behalf of the Free Religious Association to explain her mission and the need of it at the coming anniversary of the Association. The little lady's tone and manner were wondrously self-possessed and dignified as she replied in the purest English that her duties at the hospital were such as to keep her constantly employed from six in the morning until nine in the evening; that she was anxious to learn as much as possible in the three months she intended to remain in the hospital before returning to India, and as the day on which the anniversary of the F. R. A. was to be held, was "operating day" it would be impossible for her to attend, even, any of the meetings, much less prepare an address in addition to her other duties. Her quiet

acceptance of what she considered to be her *duty* in the matter was superb. When the evening came on which she had been asked to speak, she was not present at the meeting, but her husband, Gopal Vinayak Joshee, who had recently followed his young wife to this country, gave an address, afterward published in the proceedings of the convention.

A month or so later, Dr. Joshee despite her anxiety to finish her experimental three months' course at the New England Women's Hospital, was obliged through over-exhaustion to give up her work there. One evening in June, at the home of the editors of this paper, she, with her husband, met a few congenial friends.

That evening we know is still cherished in the memory of the others who were present, for it brought them into nearer relations with, and clearer understanding of Oriental humanity than the reading of many books on the subject could have done. A uniquely foreign and dainty looking pair they appeared, both dressed in very becoming native costume. She wore no bonnet, but instead a fawn-colored wrap enveloped her finely shaped head and gracefully draped her shoulders; this was removed on entering. Her robe of some fine dark woolen material was edged to the depth of several inches with gold-colored embroidery, and, in spite of its flowing drapery at one arm, fitted nicely her plump *petite* form; gold bracelets adorned her wrists. The dark face was round, with full lips, handsomely shaped brow, broad and intellectual looking; between the eyebrows a small tattooed mark, somewhat in shape like a cross, appeared. The eyes were beautiful and expressive, large, black, softly shining, as capable of smiles as of tears, but with a strangely pathetic look in them as if through them ages of unappreciated womanhood appealed for justice to the nineteenth century. The prevailing expression of Dr. Joshee's face was grave, dignified, almost sad, but the rare smile which marked her appreciation of the ludicrous was charmingly bright and girlish. The talk drifted during the evening into channels which in spite of her modestly diffident manner, drew out her opinions. Reference was made to the impression received by Christian Sabbath-school scholars from missionary reports as to "heathen darkness" and the sacrifice of human life to Juggernaut, and the casting of babes into the Ganges by their mothers. These stories the Joshees claimed to be exaggerations of the missionaries. The car of Juggernaut being an immense structure, some thirty feet in height and proportionately heavy, used to be brought out once a year for holy procession. It was esteemed a sacred privilege to assist in drawing the car, thousands gathered from far and near, the country was hilly, sometimes the car would slip and other accidents would occur by which life was lost; and these accidents were exaggerated by the missionaries into wilful sacrifice. The mothers who threw their babes

into the Ganges were often driven thereto by poverty which threatened starvation to both, while salvation for the souls of the little ones was hoped to be secured by drowning in the sacred stream. Dr. Joshee said that during her medical experience as a student in Philadelphia a large number of new-born infants, found dead with marks of having been killed at birth, or who had died by reason of the desertion of their presumably unmarried mothers, were secured as "subjects" for the dissecting room, and she might as well on her return to India relate this fact and claim that it was the custom of mothers in America to kill or desert their new-born babes, and adduce this as a result of Christian belief.

In a discussion, introduced by Mr. Joshee, of the right of men to kill and eat animals, one of our party in defense suggested that inherited appetites might necessitate the continuance of a practice revolting to our sense of justice, since our bodies had been built up of such material, adding also that a climate differing from India might require more stimulating food; to which Dr. Joshee replied that she had lived for over three years in America without once tasting of animal food and without feeling any need of any food different from that she had been accustomed to in India.

She was asked, as one who was herself familiar with the Sanscrit Scriptures, if Edwin Arnold's Indian poems were true to the originals in spirit and meaning, or were the beauty of diction and lofty morality found in them due to Arnold's own ideality and exuberance of poetic imagination? She said that though he had changed the *form* by putting the translations into verse, yet that his poems were mainly true to the originals, and he had not idealized or exaggerated, but on the contrary had sometimes failed to catch the subtle spiritual meaning of the ancient writings.

She spoke sensibly of "Christian Science" theories, had taken several lessons therein and told how she saw on what natural basis those theories could be explained. Spoke of her investigations in phrenology and how she found in her medical studies, especially in dissecting the brain, reasons for disbelief of some of the claims made by enthusiastic believers in phrenology as a science.

Her acquaintance with American and English scientists, writers and others of note, was something phenomenal. This was evinced in looking over a collection of photographs of a large number of these. As each picture was looked at, she showed by a few appreciative words, her acquaintance with the field of work of the original. "She is simply wonderful!" exclaimed one lady of the party, as she listened to her, and this opinion was echoed in a note sent the writer from another lady who accompanied the Joshees a short distance on their homeward route that evening.

But she is dead!—that sweet intellectual soul, that

large-brained, self-forgetful womanly creature!—dead at twenty-three, she who had sacrificed so much to gain so little; dead at the threshold of her work for which she was so well equipped. She had just been appointed Resident Physician of the great Albert Edward Hospital of Kohlapur in Bombay. "It was generally recognized" says the *Philadelphia Ledger*, in noting her death "that her return to her native land was the opening of a great and new era for women in India."

Yet this rare sweet spirit was still "an unconverted heathen," and as such Andover Theology bars her sternly out of its circumscribed little heaven, and commonplace English men and women considered themselves her superiors, and refused to associate on equal terms with her on her homeward voyage! We sympathized sincerely with her loyal husband's indignation as expressed in a letter on that subject, published in one of the last numbers of *The Index*. S. A. U.

M. Albert Réville, who fills the chair of the History of Religions at the Collège de France, Paris, in writing us that we may expect a contribution from his pen on the "Future of Protestantism in France," says: "I have received the copy of THE OPEN COURT that you were kind enough to send me. To say that all that I have read in it pleases me entirely would be an exaggeration. Although an outspoken advocate of religious progress that is positive and not a *salvo morale* that vanishes into thin air, I look upon agnosticism only as a starting point analogous to Descartes' philosophic doubt and not as a goal. I consider those who get ensnared in it to be the promoters of religious stagnation because the fear of nothingness will always keep the majority of mankind in the camp of those who affirm something however irrational these affirmations may be. In a word, I should like to see, by the Protestant method, the *evolution* principle supplant, as a principle of religious progress, that of *revolution*; in other terms, I prefer to continue, to enlarge, to rectify and to purify the liberal tendency that has already set in, rather than have recourse to those violent changes which may have been necessary in the past but which cannot be justified, philosophically, at the present time."

* * *

In an article entitled "A Friend of God," in the *Nineteenth Century* for April, Matthew Arnold shows how the gradual decadence of mythology in religion has been accomplished by the process of intellectual development. Heretofore, a mythological element was absolutely essential to the existence of a religion. The great mass of men were only satisfied with a faith which excited the imagination, and through it developed the feelings of wonder and awe and a sense of responsibility to an unseen Deity. The Salvation Army, the Methodists, and some other primitive sects, are the still exist-

ing representatives of that type of faith. "The epoch-making chance of our own day" is that we are reaching a place where religion can rest on no mythological basis whatever, whether moral or immoral. The "gross mob" of men have shown hostility toward religion, and evidences of that feeling are all too common now, but along with an enmity against any discipline to uplift and ennoble, there is developing a feeling of impatience and wrath at what they look upon as the trifling of those who offer them, in their great need, the old mythological faith,—a thing impossible of acceptance and passing away, if not quite passed; "incapable of either solving the present or founding the future."

* * *

Incongruities and anomalies seem to be inevitable in intellectual, social, moral and religious evolution. Old conceptions, creeds and forms partially outgrown, persist through periods in which the newer thought and the movements in the line of progress are yet incomplete, unsystematized and unco-ordinated with the established order of things, causing temporarily imperfect adjustments and all sorts of inconsistencies in beliefs and habits, in ceremonies, customs and institutions. The more rapid the changes the greater the disturbance and more marked the inconsistencies. One of the characteristics of all religious transitions is more or less moral disturbance. Doubt concerning theological doctrines long believed to be the only foundation of ethics must, in many minds involve a weakening of moral restraints. Of this, illustrations are afforded by the Reformation, especially in its earliest period, when the lives of multitudes of adherents of the new movement furnished its opponents with a most effective argument against it. The evil became less only as a readjustment of ethical ideas to the changed religious belief gradually took place. These facts it is important that liberals thoroughly understand that they may see the necessity of teaching ethics on a firm basis, of familiarizing the people with the moral side of their philosophy, and of replacing superstition with the truths of nature. Meanwhile, let all who would fairly judge a theory or a system by its moral results give it time to overcome the disturbance produced by contact with old-established errors which have been made the basis of moral teaching; and let all who may be discouraged by the imperfections of individuals identified with any reform, find consolation in the study of the great reforms now popularly known only by their beneficent results.

* * *

Mr. J. B. Harrison, whose volume on "*Certain Dangerous Tendencies of American Life*" was one of the most serious studies of social and industrial conditions yet produced in this country, is doing valuable service as a representative of the Indian Rights Association, formed recently, with headquarters at Philadelphia.

He has visited during the past year all the principal Indian reservations, noted everything bearing on the schools, farming, home-life, and missionary work in their midst, also the actual administration of affairs by government agents, and has embodied the result in a little volume entitled, *The Latest Studies on Indian Reservations*. This is no "moralizing" or waste of sentiment, nor is it a colorless statistical report; it is emphatically a readable book, full of incidents and photographic pictures, and is invaluable for anyone who wants the actual facts of the Indian question. The Association has already published other important literature; it is all sent free to members paying \$2.00 a year (office, 1,316 Filbert street, Philadelphia). Those who would help in remedying a great national wrong cannot do better than by aiding the association.

* * *

Mr. Cable, the widely-known novelist, having settled in Northampton, Mass., has begun a Sunday Bible-class in the opera house of that town. Those who remember what an evident moral purpose runs through *Dr. Sevier*, and yet recall how free that brilliant novel is from the heaviness and triteness of the ordinary "good book," will not be surprised to learn that Mr. Cable's class is very popular, both with the people and the press. His treatment of the Bible follows the way of many modern literary minds, a way best exemplified in Matthew Arnold's religious works, and in J. R. Seeley's *Natural Religion*. As instance of this may be cited Mr. Cable's reply to a question whether Moses didn't write the story of Joseph, and if it wasn't written a thousand years after the incidents took place. "I don't know, and I don't care," said Mr. Cable, promptly and emphatically, "these questions of authorship are not supreme ones, and the Bible should be studied on its merits. For one, I rather enjoy its anonymous character, think it has a tendency to stimulate one's spirituality, and prefer to know what is written than by whom."

* * *

The policy of the Roman Catholic church was never more plainly evidenced than in its relation to Dr. McGlynn and the Knights of Labor movement. The stern command to refrain from appearing in public as the champion of that movement and of the theories of Henry George, was not disregarded by him without the inevitable consequences. He was suspended and ordered to Rome, but when he refused to obey that order and continued to plead in the interests of labor his superiors after a momentary outburst of wrath, quieted down and took into consideration the conditions with which they had to contend. It was seen that a large number of Catholics were included in the Knights of Labor organization, and that an attempt to force Dr. McGlynn to obey might make clear to their eyes the true character of the church and its opposition to anything like

individual freedom. A less aggressive policy was adopted. The Knights of Labor were indorsed and their purpose sanctioned.

* * *

In an article entitled "A Glimpse of Russia," by the Countess of Galloway, published in the *Nineteenth Century* for April, the attitude of the orthodox Greek church toward the different phases of modern religious thought is briefly touched upon. There is little effort on the part of the church to meet the perplexing questions that are constantly rising and demanding examination, and attempts at control of the general mind are slight and soon given up. Correct performance of the duties which the discipline requires constitute all that is demanded in fulfillment of religious obligations. There is a tale of a conscientious agnostic who, when compelled to go before the priest for confession, commenced by saying: "*Mon père, je doute de tout*" (My father, I question everything). His confessor treated this statement with complete indifference, and commanded him to make his confession without troubling his conscience on that matter.

* * *

The *Popular Science Monthly* for April reprints an article from the *Saturday Review* on "Rustic Superstition." In the rural districts of England beliefs and practices are still retained that were prevalent when the "black un" was believed to take possession of and bewitch whatsoever worthy and peaceful individual he would, and when the meeting of a black cat at certain unfavorable hours of the day or night, was thought to portend consequences of a very unpleasant character. Soothsayers and wizards still exist and the credulous public is willing to part with its half-crowns in return for "the future unveiled," or charms and incantations to drive away whatsoever ailments the flesh is heir to. Any mysterious happening in an out of the way locality or deserted house, is referred by the knowing ones to "Summat," which distinguished individual, though never seen, is universally respected and propitiated. As superstition is inevitable where ignorance reigns supreme, it is not hard to understand that the most efficient remedy is compulsory education.

* * *

In "Confessions of a Quaker" in *The Forum* for April, the author, after dwelling upon the changes which his church has undergone since 1650, the date of its origin, concludes with the statement "There must be a full return to the original basis of the Church of Christ, and entire consecration to its living Head, in theology, polity, experience and work, and the only true model for this is found in the New Testament Scriptures." It would seem incredible if it were not known to be true, that there are men who calmly make such statements as this, being apparently ignorant of the Middle Age flavor

which the teachings that they seek to resuscitate have acquired. The Quakers of to-day are not so blind to the truth that they can forget and put aside the intellectual plane upon which the world now moves, and return to those primitive conditions and forms of belief which were characteristic of them in their incipiency.

* * *

Mr. Joseph Shippen, in his fine tribute before the Chicago Channing Club to the character of the late Dr. William G. Eliot, said:

At the opening of the great St. Louis bridge, its eminent engineer predicted that, constructed of parts that could be replaced at any time without interruption of travel, it would last as long as required by the wants of man, and declared that, with capital enough, he could have made it of one arch instead of three. The life and character we have been considering was a single arch of fidelity and consecration. Believing in the imperishability of great examples, we believe the influence of our departed friend on the minds and hearts of men, inspiring them to liberty, holiness and love, will be immortal.

* * *

The fact that the Free Religious Association, organized primarily for the study and discussion of religious subjects, has not gone into the business of general practical reform is no good reason for Mr. Garrison's complaint against "free religion." Individually, and in connection with other organizations the free religious people probably do their share of philanthropic work. Many of them are prominent leaders of reform movements. "Free Religion" is an indefinite phrase, since the F. R. A. has no religious creed and is composed of Christians and non-Christians, Theists, Agnostics, Positivists, Hebrews and Buddhists. How far they are agreed as to free trade, prohibition, etc., we are unable to say; but the fact that they differ on these and other subjects which are now before the people for discussion and action, is no valid argument against any religious belief found in the Association.

* * *

Any subscriber of THE OPEN COURT who fails to receive his paper regularly is requested to communicate the fact to this office.

PRO CONFESSO.

BY GEORGE WENTZ.

Whoso writes delightful story,
True and touching, full of lore,
Shall in human nature's longing
Hold a place for evermore.

All the docks and mossy harbors,
Where the sea-ships come and go,
Still rehearse that spell and pleasing
Of the pages of Defoe.

Eldorado?—still we wonder
Can there any Island lie
In the west of life's attaining,
Where our prime might never die?

Still in secret depths of feeling
We escape Time's onward span;
For the youth's remote transfusion
Stirs the pulses of the man.

COPE'S THEOLOGY OF EVOLUTION.*

BY EDMUND MONTGOMERY.

Part I.

Knowledge and not agnosticism is the veritable goal of science—conviction, ample and entire, the natural craving of the human heart. It is well enough to have no settled mind regarding the origin and final doom of all creation. But it can be neither satisfactory nor beneficial to maintain an agnostic attitude towards the great practical issues of human existence. Here on this planet we find ourselves, launched on a precarious voyage, freighted with all the wealth of world-responsive life. This transcendent heritage, of which we are the entrusted bearers, how are we rightfully to dispose of it? No other question is so supremely urgent. We desire an unambiguous answer.

Is the gathered treasure of life to be used among the needy insufficiencies of this nether sphere, to become through fruitful investment the enhanced patrimony of our human issue? Or has it to be jealously conserved, hereafter to adorn our own presence, where celestial affluence shall smile at earthly wants?

Are we actually what we seem, genuine planetary beings, in our right place here below? Or have we merely got here by some mysterious blunder elsewhere committed, and are, in truth, metamorphosed denizens from another region, only for a time of penance entangled in this mortal coil?

The immensely laborious uplifting of life, consecrated by the suffering and death of countless generations; the passionate wrestling for the well-being of our kind, for the victory of our social aspiration; are its tragic adjuncts grounded, of necessity, in the defective but perfectible nature of things? Are we, indeed, engaged in a solemn life and death struggle, decisive for human existence? Or are we only puppets in organic form, handled from above, and made to enact here a troublous scene of seeming joys and sorrows, valid in itself for nothing, save the delectation of a self-sufficient outsider, who keeps it all going for his own good pleasure?

These are the vital questions we are yearning to have definitely solved. Theologians, philosophers, scientists, in their inmost heart, know quite well that there can be no compromise between the two views. Sometimes with sincere directness and single-hearted love of truth, oftener with much twisting and time-serving circumspection, they are, from their different standpoints, either seeking for more positive assurance, or already inculcating the one or the other opinion. Our time is ripe for clear judgment and definite choice. To occupy one's self earnestly with the present state of the problem,

and keep, nevertheless, one's mind and inclination suspended between the two incompatible views, betokens over-subtle skepticism or faint-hearted indecision.

Doubt paralyzes action. Obedience to duty presupposes settled faith in a guiding principle. And sane enthusiasm for a cause is only kindled through firmly established conviction of its absolute justice and supreme import. It is not by doubt that humanity can ever prosper. Only through dutiful compliance with sound guidance, and through sane enthusiasm for a just cause can we ever hope to scale loftier heights of civilization.

What guiding-principle, what cause shall it then be? Not to follow the senseless lead of fatuous lights in this all-important quest, we have, first of all, to know for certain, whether this manifest universe is our real home, or whether we belong by rights to an entirely different order of existence? Are we to fight this battle of life under the banner of world-deliverance or under that of world-fulfillment? Is it to be the religion of life hereafter or the religion of actual living? celestial or terrestrial ethics? We have to decide.

How manageably compact was the conception of the world, and our place in it, a few hundred years ago. To Luther, who freed us from the tyrannous impositions of an insolently artificial and lethargic creed, the whole creation seemed one continuous battle-field, where the great antagonistic powers, God and the Devil, were contending for human souls, over which the Evil One had stolen a fatal advantage. All good things came from God; all bad things from the Devil. The teaching of the Bible, as interpreted by Dr. Martin Luther, the chosen vessel of the Lord, was supreme and infallible truth. Its sincere believers were God's only children, whom he would save. All others, the adherents of the Pope and Mahomet, the Jews and the Gentiles, and savages of all sorts, were partisans of the Devil and lost. Despite God's merciful efforts to rescue mankind by the sacrifice of his only son and the gift of his holy word, Satan had evidently gained almost complete sway in this wicked world. But soon, very soon. God was going to confound the Arch Fiend by putting a sudden and violent end to this huge mass of human depravity and perversity; and then all will turn out well for those who have kept the true faith; but woe unto them who have gone astray.

In such closely-pressed and spirit-haunted Aeldama, with child-like faith, the great Luther lived and died, and wrought the mighty reformation, whose liberating power was man's conscientious self-discernment of truth.

Standing inflexibly firm on thy narrow ground with deeply sincere and fervid heart, thou hast fought marvellously well thy life-long battle against hierarchal frauds and shams, thou sturdy champion of righteousness. Monastically bewildered at the overpowering

* *Theology of Evolution*: A lecture by E. D. Cope, Ph.D. Philadelphia, 1887.

promptings of human emotions and aspirations, it was not in mere outward observances and penances that thy honest soul could find absolution for this abysmal feud, raging within thee between thy nature-moulded self, and the world-alienating will of thy Christian God. Peace could come to thee in so superhuman a strife, only by leaning with the trustful unconcern of implicit faith on an all-reconciling Savior.

How changed that categorically methodized world of thine since thou left it! Thou wouldst not know it again. A whole succession of Muenzers, Zwinglis, Agricolas and of ever so many other new kinds of cursed innovators have recklessly burst in all directions through thy biblically-compassed scheme of life, sacrilegiously overthrowing its seraphic and satanic superstructure, and threatening with total dissolution all its traditional assumptions.

So it has come about that in these last two centuries of unchecked reformation theologians and philosophers have been forced to discuss exhaustively the various proofs from time to time advanced in rational support of the current faith in the existence of an omnipotent Creator and in the immortality of the human soul. And those who have given the greatest attention to these transcendent problems know best to what extremities reason is here driven, and on what slender threads it has at last to fasten the theological faith. Its most efficient arguments,—that from design, and that from the fixed order of nature and its intelligibility,—even these strongholds of natural theology do not hold out when closely besieged. The nature of the designing and ordering power, and the process by which the results are attained, remain utterly inscrutable, however much reason may strive to gain some insight into it. And the most careful scientific scrutiny has failed as yet to detect any room for supernatural interference with the intrinsic ways and means of nature.

If, among Professor Cope's audience at Philadelphia, there were such who had realized the distance which reason and science have thus placed between our natural understanding and the objects of theological faith, they must have felt eager, indeed, to learn from an eminent scientist what "absolute proposition with certain demonstration" had been discovered to attest,—contrary to Job's assertion,—that God has at last been found out by searching, and that we may hope for immortality on a "sound and solid" scientific basis.

Should it really prove possible scientifically to demonstrate with absolutely certainty that a supreme and eternal Mind is ordering creation, and is the "common source" from which our "lesser minds" are derived, then all theological doubt will at once vanish from among us, our proper course in life will have become positively determined, and we shall soon get to regulate all our doings in accordance with such incontestable scientific certainty.

When an investigator of nature has, by means of his special studies, become convinced of a great truth whose general acceptance would be all-important, it certainly devolves upon him as a social duty to proclaim and explain it to the world at large, that all may profit by it. We are, therefore, truly thankful to Professor Cope that he has not, with pedantic exclusiveness, withheld from the common herd the theological view of evolution which his biological studies have forced upon him. He rightly scorns to imitate the haughty reserve of "the majority of scientific men" who "avoid the subject," and thereby increase our perplexity. With laudable fellow-feeling he lays his theory frankly before us as a scientifically grounded conclusion, to be carefully tested as such in keeping with scientific usage, so that, after due trial, it may finally stand verified as truth or be rejected as error. Professor Cope is well aware of the "inherent difficulties of the subject," but he believes that his researches into the nature of evolution have opened the way to overcome them. Let us then take a general survey of his conception as a whole, and then examine its scientific grounding.

Professor Cope's conclusions tend to show that the universe consisted primordially of an unorganized or "unspecialized" material substratum spread out in space. This uniform matter did not undergo evolutionary changes solely by dint of its physical properties; nor did it merely serve as raw material to be shaped by a supreme Artificer; nor has it played the passive part of an occasional vehicle for the manifestations of an otherwise independent mind. It was itself, from the very beginning, in possession of mentality. Mind was one of its own properties. For mind "is tied to matter as a property of matter" (p. 16-17). Now, it is this peculiar mental property of the universal substratum that has power to give specific direction to its movements. The mind of matter is its veritable formative power. Probably all material aggregation and combination, but certainly all evolutionary organization is due to the "directive power of mind." "Mind was one at the start, and all this evolution has been simply due to the active exercise of mentality" (p. 23).

It follows that the one universal mind of primordial matter, which by its exertion has produced all the evolutionary forms now extant, must be vastly superior to the separate minds derived by the individuation of special portions of matter. Therefore, this common source and origin of all world-formation may well be called God, or the "great Mind." And this great Mind being as indestructible as the material substratum of which it is a property, we, as part of it, by force of "the inseparable bond which will bind us forever to a material basis" (p. 17) are likewise indestructible or immortal.

These, in a few words, are the leading doctrines of the *Theology of Evolution*. And this theology of

evolution was courageously propounded by Professor Cope to a specifically Christian denomination. We hope that, however serious our eminent scientist may otherwise be, he possessed on that occasion sufficient humor inwardly to enjoy the consternation which his candid announcement of a supreme Being, who is one of the properties of matter, was sure to create among his intelligent theological hearers. The situation must have been extremely piquant.

Professor Cope, being a true scientist, has of course arrived at his theological conclusions by way of induction. The evidence by which he sustains the belief in a "great Mind" and in a "future life" he alleges to be "based on the knowledge that we possess of the control of mind over matter" (p. 39). Now, if Professor Cope really possesses such *knowledge*,—if he can prove that mind controls matter,—he has solved the central problem of modern philosophy.

We are all perfectly aware that our muscles are not moved by the push or pull of any force acting upon our body from outside. We know that it is by a process occurring within our organism that these aim-directed or designed muscular movements are effected. But what the true nature of this most peculiar moving process really is, that is not so easily made out. It is, in fact the very question that has been called "the puzzle of puzzles." And since Descartes it has occupied all the greatest philosophical minds,—nay, St. Augustine already says: "The manner in which spirits are connected with bodies is incomprehensible; nevertheless, it is thus that man is constituted."

Introspectively we seem to feel quite certain that it is by force of some mental power of ours that we are moving our limbs. We seem to control, through consciousness, by means of an outgoing mental effort, the action of what, in consequence, we call our voluntary muscles. We resolve to move our arm, have a feeling of effort, and, behold! the arm is moving. This is how the process appears when viewed from the inner or subjective standpoint.

But as soon as we investigate the matter from the outer or objective standpoint, which is the standpoint of science, we lose all confidence in the testimony of our introspective consciousness. The feeling of effort proves then to be centripetally and not centrifugally originated. And it becomes, moreover, utterly incomprehensible how mind can in any way impart motion to material particles. Yet this incomprehensible feat would have to be accomplished even if only *direction* has to be given to whatever motion the particles may otherwise possess; for to give direction to a moving mass is to impart diverting motion to it. In this world of ours only matter is movable and possesses momentum. Only something which is itself movable, and in possession of momentum, can possibly impart motion to matter. Mind, as such, is not

movable, and does not possess momentum; therefore, it cannot move matter (q. e. d.).

Let us see how Professor Cope encounters these ancient difficulties, and gets to believe that he has overcome them. He conceives the situation thus: "A stimulus or line of disturbance enters the body." The person receives it passively. "It is registered in the posterior part of the main hemispheres of the brain, is reflected to the front of the hemispheres, and then from that point it is reflected back again toward the executive organs of the body, passing through the striate body and nerves to the muscles, which thereupon contract so as to perform some act" (p. 12). This act is now found to be "saturated with intelligence" (p. 13). Whence this acquired exhibition of intelligent design? How has the motion that entered the body merely as a physical motion been converted into an outgoing motion bearing the stamp of intelligence?

Professor Cope accounts for it by telling us that "in the anterior part of the great hemispheres of the brain" "the line of energy appears to be submitted to a disturbance which is a deflection, a process of turning and directing, and that turning and directing is an exhibition of what is called design" (p. 13).

It is quite true that to an *intelligent observer* the designed activities of a person appear "saturated with intelligence." This is an incontestable and marvelous fact of nature. The difficulty is to explain it from a scientific standpoint. The relation of motion to intelligence is the enigma in question, and we venture to assert that Professor Cope cannot possibly solve it from his position of "tridimensional realism." Moving matter obeys undeviatingly physical laws, and mind cannot deflect it from its determined course. How little the outgoing movements of the living organism are really themselves intellectual,—how purely physical, on the contrary, even the most significant of them are,—becomes very obvious in contemplating human speech. What movements could be more "saturated with intelligence" than those which are capable of conveying our inmost thoughts? Yet a piece of tin-foil in a phonograph, by means of nothing but mechanical impressions, will have the same intellectual effect on us as the movements of speech that have received "in the anterior part of the great hemispheres" the "turning and directing" twist of design. Where, then, in all reality, is the intelligence seated which these purely physical movements seem to possess? The sounding,—nay, the merely vibrating shocks of the phonograph, the printed characters in a book, where do they acquire their mental significance? They strike our sensory organs simply as physical stimuli, and it is evidently we who, in receiving them, invest with a whole world of consistent meaning their slight and evanescent hints.

Is Professor Cope right, then, in assuming that, when

the stimulating effect "goes in, the person who receives it has nothing whatever to do with it;" that he merely "takes it" and "is passive" (p. 13)? Here, already, at the portals of individual life, the stimulating call of outward nature rouses from the mystic depths of organic latency the responsive mind; and on the slender suggestion of nothing but a rhythm of aerial touches it pictures with symbolic accuracy and profound comprehension the great spectacle of the real world. It is quite evident, then, that the organic individual does not "take" the stimulating influences passively, without having any thing "whatever to do with them." They do not enter the magic circle of life without suffering a vital transmutation as incomprehensibly strange as any in nature. If a directing turn or intelligent significance is at all imparted to motions within the living organism, surely here, where etherial pulses signify the whole world, this mental stamp is impressed on them even more strikingly than when, as in outgoing muscular movements, they mean only our own feelings and thoughts.

In harmony with Professor Cope's train of reasoning, this consideration involves that all stimulating influences which reach our sensory organs are "saturated with intelligence." And if so, his theory of perception would nearly agree with that of Berkeley's: universal intelligence communicating perceptively with individual intelligence. Only he also would then be logically led to discover that in this light matter is only a superfluous impediment easily argued away. To his own astonishment he would learn to "understand the idealistic universe," which he now believes himself unable to conceive.

The truth is mind, as such, is a forceless inner awareness of what takes place independently of it. It cannot alter a jot the path of material particles. The entire chain of molecular motions set going by stimulation,—a process which can be realized *only from the objective standpoint*,—is rigorously physical. This means, *according to our present scientific conception*, that it is absolutely predetermined by the previous physical disposition of the molecules and their motion. Consequently, there can be no room anywhere for mental interference; fundamental scientific principles forbid us to assume it.

During physical investigation we are observing an enchainment of phenomena, whose disposition in space and behavior in time are absolutely determined by non-mental occurrences outside ourselves, and which we are utterly incapable of changing by any mental exertion on our part. We defy any one, idealist or no idealist, to change by a purely mental effort the objective aspect of any occurrence; for instance, the place or speed of a carriage passing by. The perception of it is entirely the perceiver's own mental realization; but it is, nevertheless, definitely compelled by the stimulating influences. In exactly the same manner are all perceived or perceivable motions compelled by extra-mental processes; those

taking place in the brain or in other parts of our body not less than the rest.

To become mentally aware of extra-mental existents and their activities—aware, for instance, of the brain and its functions, we have to assume the objective attitude by allowing such existents and their activities to stimulate our senses. It is evident, then, that the existent and its activities thus casually realized in consciousness at that particular moment, exist independently of such realization, and cannot be influenced thereby. This holds good just as well when such existents and their activities are forming part of our own organism, as when they are forming part of the rest of the outside world. How, indeed, can my mind possibly influence the existence and activity of my brain, of which it can gain knowledge only by assuming the objective aspect towards it, and of which it is otherwise wholly unconscious, being, in fact, itself its stimulated outcome. Who, during perception or thought, is at all aware of the corresponding molecular motions simultaneously going on in his head? And how can consciousness then influence the state of being of something, of whose existence it has not the remotest inkling?

The only way out of this central dilemma of science and philosophy is to show that the leading principles of our present mechanical interpretation of nature are untenable; that the molecular processes constituting vital activity are hyper-mechanical, imparting themselves the "directive turn" and specific energies to stimulation received from outside.*

We will now try to find out by what special scientific error Professor Cope manages to insinuate mental effectuation into the physical nexus. In agreement with the principle of the conservation of energy he himself says: "Force, that is action or motion, cannot be caused except by the appropriation and modification of some pre-existent activity or motion" (p. 14). If so, then we must ask whether the direction, *i. e.* the changed motion, which Professor Cope attributes to the influence of consciousness is caused by the appropriation of some motion that pre-existed in consciousness? Here evidently lies the error. Professor Cope has failed to realize that the imparting of direction to matter is as much a physical act as the imparting of any other mode of motion. It can be done only by a push or pull, or let us add by physical repulsion or attraction. Consciousness cannot possibly be a vehicle of pre-existing motion, a thing possessing mechanical momentum, and entering into the physical nexus as a correlated force, receiving and imparting physical energy. Yet Professor Cope says: "It is not only pretended, but proved, that that external energy passes into the consciousness of

* This has been attempted by the present writer in a paper on "The Dual Aspect of our Nature." *Index*, October, November and December, 1885, where also the relation of the two aspects, the subjective and the objective is explained.

man," and "receives within him a stamp or a turn or direction, that energy cannot receive under any other circumstances known to us" (p. 14). This means obviously and inevitably that consciousness gives direction to motion, which again means that consciousness, like any physical force, imparts to matter a motion different to that which it already possesses. That such mechanical intercommunication between consciousness and matter cannot possibly take place, Professor Cope fully realizes, for he clearly asserts, "that consciousness has essentially no affinity with anything else;" that it "is not only entirely distinct in its essential nature from matter, but also totally distinct from energy or motion" (pp. 16-17). Thus by his own admission it has no community of nature with anything physical, and is, therefore, totally incapable of influencing the physical nexus.

Professor Cope's leading conception, on which he has not only erected his entire theological superstructure, but which he uses, moreover, as a fundamental principle to account for organic evolution itself, consists in the assumption that consciousness can control the movements of matter. We will no longer inquire whether he is able to prove the validity of this assumption; for we have seen that this is altogether out of the question. We will only ask whether he has formed any kind of idea as to the manner in which such a control of mind over matter might possibly take place. He himself puts the question: "What is, then, the immediate action of consciousness in directing energy into one channel rather than another?" (*Origin of the Fittest*, p. 427.) And, of course, as one would expect, he is utterly at a loss to answer. He distinctly perceives that consciousness "is not itself a force (= energy)." Consequently he expresses most emphatically its impotence to produce motion. He says: "How, then, can it exercise energy? Certainly no more than the bare good will of the train-hands can pull the train. Such an explanation is to admit the possibility of making something out of nothing" (l. c.).

Yet the experience of so-called voluntary movements gives him a pretense, as it has done to so many before him, to assume some kind of effective connection between consciousness and the movements. Here, in his "Address on Catagenesis" delivered two and one-half years ago, he is, however, very candid in touching on this most delicate and eminently important subject. He is, by no means, conscious of having positive "knowledge" of this supposed influence of consciousness over material motion. On the contrary he acknowledges knowing nothing about it. All the information he has to give us concerning this distinctive feature of his theological and evolutionary theory, is contained in the following sentence: "The explanation can only be found in a simple acceptance of the fact as it is, in the thesis, that *energy can be conscious*. If true, this is an ultimate

fact" (id., pp. 427-8)*. This means simply that Professor Cope is aware, like all of us, that consciousness *accompanies* some of our movements; but that he has no more than any of his philosophical or scientific foregoers, the remotest notion how such consciousness can at all influence the motion of matter.

To sum up: We have avowedly not the slightest "knowledge of the control of mind over matter." Quite the reverse. It has been proved that mind cannot possibly control matter. It is, however, *solely* on the pretended *knowledge* of such control that the "Theology of Evolution," with its belief in a "great Mind" and in a "future life" is based. This sole basis having crumbled to pieces, the entire superstructure has necessarily also caved in. The "lesser mind," of which alone we have experience, not being able to impart direction to matter, the "great Mind," the new scientific Deity, whose existence is only analogically surmised and analogically endowed with the pretended power of imparting direction to matter, has therewith irrecoverably vanished into the same thin air as other theological speculations.

THE FOURTH ANNIVERSARY OF THE SOCIETY FOR ETHICAL CULTURE OF CHICAGO.

The fourth anniversary of The Society for Ethical Culture, of Chicago, was celebrated at the Madison Street Theatre, on Sunday, April 10. There were seated on the stage beside Mr. W. M. Salter, the lecturer of the society, several of the leading members, who, after the regular lecture, were called upon by him to speak and responded each in a short address. The society has been steadily gaining ground both in the way of an increasing membership and in respect to finances. During the last year rooms have been taken by the society in which are held its monthly conferences, the ladies' charitable meetings, a class in ethics, the young people's social reunions, as well as an ethical school for children (Sunday mornings), which at this writing has an encouraging attendance. The anniversary meeting was well attended and great interest was manifested by those who listened to the remarks of the several speakers. We give below short extracts from some of the addresses.

Mr. Salter, dwelt at the outset upon the encouraging outlook, laying special stress upon the fact that a strong and abiding interest had been manifested in the work which the society had taken upon itself to do. He then said:

The real sources of our inspiration are in what we have yet to do. The thought that stirs me most is that there is work to do in this community and we must do it. There are those out of sympathy intellectually with the churches and we must make a

* In a recent note on the last page of his work on *The Origin of the Fittest*, 1887, Professor Cope re-enforces this position. He says that the explanation of the control of mind over matter requires "the assumption of the thesis that 'energy can be conscious.'"

home for them. The liberal churches do not take our place. They are resting places for a day, but they do not satisfy. The type of religion represented in most of our independent and liberal churches, is transitional religion. Logic conducts to them, but conducts beyond them. It is better to be in them than in any of our orthodox churches, but those only remain in them who think a little way and then stop.

There is no reason for my leaving orthodoxy that does not lead to complete free-thought. We have to make not a resting place, but a home for men and women of liberal tendency; a fellowship with a spirit so free and an ideal so high that there can be no necessity nor wish to leave it. We should show that for those driven by conscientious scruples out of the churches, there is as warm a welcome here as they ever found there. The human heart longs for fellowship, longs to meet with kindred minds. We ought to say to people ill at ease in the churches and out of them, come to us, you will find rest with us, you will find there is still an aim in life and a consolation in suffering and in the face of death, though you cannot believe in one of the old perplexing doctrines. I bring before my mind a great number of such people, people who are without a home for the soul, and I say to myself, that is my call, that is your call, to find them out, to bring them to us, to bring them home.

The president of the society, Judge Henry Booth, said:

I can think of no better way of occupying the few moments assigned me for addressing you than by stating some of the leading ideas which our society represents, as I understand its position, speaking for myself alone. First and foremost this society stands for the idea of law, universal, immutable, inexorable law—law without variability or shadow of turning. Whence its source or where its seat we do not know—we do not pretend to know. That is the mystery of mysteries. We know it only in its operation and we know and feel that we too, in common with the universe, visible and invisible, are subject to its operations; that we are held in firm allegiance to this universal law, an allegiance which we could not break if we would and would not if we could. In the presence of this universal law ancient myths, whether of Greek, Roman, Egyptian, Chaldean, Phœnician, Hindoo or Hebrew origin, as the basis of ethics, have no place.

They form no basis for our faith. They illustrate the fertility of the imagination of men in the dark before the light of science had arisen to reveal the operations of this universal law. This law includes all the moral order of the universe, and first and foremost is the principle of justice, which if properly considered, includes all ethical principles and all their applications; without which ethics is an unmeaning term.

Mr. A. S. Bradley said:

The question has been asked, "What does the Ethical Culture Society stand for?" I would answer that it stands for the production of a higher type of human character, a factor in the evolution of character and conduct—the only aim for which life is worth living. It stands for it as the *quasi* science of antiquity stood for the development of steam, chemistry and electricity; as the philosophy of ancient India and Egypt stood for modern philosophy. But the important question for us as individuals to consider is, not what the society stands for, but whether we are worthy, to use the words of Lincoln, "to be dedicated to this unfinished work." It is our own character and conduct which first needs our attention; and in this regard the maintenance of these lectures chiefly concerns us, that we may be faithfully reminded of duties unperformed, of duties to be performed, so that we or our children may

"rise on stepping-stones
Of our dead selves to higher things."

As Mr. Salter says: "Evolution goes on rapidly or creeps along painfully according as our thoughts are quick or slow and dead." But let it seem fast or slow, the cause of free-thought must ever advance, and we will still say to the priesthood as Galileo said, "*It moves!*" And let our work fail; we will yet say, "They never fail who work for a great cause. Though years elapse they but augment the deep and sweeping thoughts which overpower all others and conduct the world at last to freedom.

Mr. H. de Roode was the next speaker:

Perhaps as a man of business I may point you to the encouragement I feel in the growth and development of this society; standing as it does for a new principle, and realizing the spirit of the poet who saw "sermons in stones and good in everything." I already look upon this society, though so young, as a great factor in shaping the ethics of practical life in our great city, and even teaching the pulpits, yea out of their own Scriptures, the new and higher meaning of human life. My friends, hundreds of years ago the spirit of a dull age was lifted to higher ground by the watchword of a zealous apostle: "To the greater glory of God." As it has ever been and is now, our altars must ever be inscribed: "To the unknown God," but let our mission be none the less sublime if, clad in the garments of righteousness, we unfurl to the breeze of progress a banner of salvation with the nobler motto: "To the greater glory of Man."

The remarks of Mr. Joseph W. Errant, the last speaker, were as follows:

My friends, the way to make the new ethics a part of our lives, a part of our natures, so that it shall be a permanent factor is to work in the fields of practical ethics. This is the test of the inspiration of ethics, our practical adherence to the obligations which it imposes. The training school is the work of the world, it is this which makes ethics real and practical; it is for the home for the school, for the manufacturer, for the professional man.

The future will be then what we make it. At our door lie great and pressing problems begging to be taken in; they belong to us; they have a right to ask for admission. Moral questions cannot be voted down by numbers. They call for thought, for justice, for action. Moral questions cannot be kept out of sight, they have a constant tendency to come to the light, where they belong.

Oh, what great opportunities are ours! and in this moral work who is there that will not gladly join, who does not feel upon him the obligation to do and dare for the right.

CORRESPONDENCE.

CRITICISM OF THE PULPIT.

GEORGE JACOB HOLYOAKE TO THE DUKE OF ARGYLL.

To the Editors:

The following letter, which I recently addressed to the Duke of Argyll, explains itself and its occasion:

As one who is interested in the secular and moral discussion of pulpit teaching, I venture to write to your Grace on behalf of many of a similar way of thinking, concerning the remarks with which your article opens in the March number of the *Nineteenth Century*. The eminence and influence of your Grace, not of rank merely, but what is of more merit in our eyes—in oratory and literature, must be our apology for attaching importance to your words.

In replying to and, in effect, reproving Professor Huxley for his criticism of certain misleading teachings by Canon Liddon, your Grace says: "The pulpit has hitherto enjoyed not, perhaps, absolute, but, at least, a general and customary immunity from controversy or reply. It is surely well that this custom should be respected."

Why so? Is not the priest more dangerous than the politician? It is by the contradiction of the politician and putting him

to the proof, that the public prevent his tongue from being pernicious. The politician speaks in the name of reason which admits of appeal. The priest professes to speak with the voice of God, against which there is no appeal; and if the words of the priest are unquestioned his errors come to be regarded as divine. It is singular that the Duke of Argyll should deprecate the criticism of the clergy—he who is of a race and is the head of a clan, who never shrank even from the more serious criticism of the claymore. Are not the clergy trained for feats of theological arms? As a rule they have claws like those of an octopus. The courteous sort wear a velvet glove, but underneath is a hand of iron, which they call their "mission." Some, indeed, have a real human hand within the glove, but they are all suspected by their brethren as "unsound" somewhere "in the faith." What exemption do they need from controversy? They can get aid by prayer, while their adversaries must depend upon themselves. God stands behind the priest, the law is with him. Canon Liddon has the influence and arrogance of the State Church on his side. Popular prejudice protects him. The mob, ill-dressed and well-dressed, applaud the priest, however insolent he may be—and he often is insolent—while his secular critic is commonly unfriended, unsupported and unencouraged.

Your Grace considers that the pulpiteer "is debarred by his occupation from pursuing disputation as others can." Then why does he dispute, himself? His life is a ceaseless attack upon others. He thrusts himself into every school and into every house. He does not respect the sick-room. He attacks the dying, he defames the character of the dead. To reply to the proselytizing priest is well understood self-defense. A man may intercede with heaven on his own account, but he may neither pray for nor preach to others without offense, unless he gives them the means of self-protection, by declaring his purpose and inviting their protest if they wish to make it. It ought to be an offense at law for any priest to use his influence with heaven privately, and get a supernatural battery discharged upon others secretly, without according them means of self-protection by disputing the validity of his clandestine and officious intercession.

What would your grace say to a soldier, who prodded all he met with his propagandist bayonet, and when they desired to criticize him in the same way declared that he was debarred from being subjected to that species of controversy? The clergyman or minister who preaches any tenet, and does provide that all who hear shall then and there question him—in self-defense if so minded—is simply an assassin of the understanding, and ought to be treated as such. Discussion is self-protection against error, and he who withholds or presents that protection is a traitor to the truth, whatever may be his mission or his motives. How much more useful is the language of Mr. Gladstone to the students of the Liverpool College, to whom he declared that Christianity could no longer be defended by railing or reticence—which means that priests must no longer defame opinions instead of confuting them, and that abstention from controversy, on any pretext, is unseemly and perilous. The soldier of trust may be a combatant.

No canon spares Professor Huxley when he thinks he can make a point against him. Why should Professor Huxley spare a canon who makes points against the truth of science? So many unfit and pretentious persons speak in the name of God until he is compromised by them, competent beyond most preachers to represent Deity, as Canon Liddon is, yet even he is not infallible, and if his speech on behalf of God is rendered exact by criticism, that is a tribute, and no mean tribute, to heaven. Since God himself is silent no words spoken in his name can be trusted, until they are verified and clarified by debate. The priest himself should be the first to invite it lest he unwittingly make an offering of error on the altar. If it be a duty to seek the truth and to live the truth, honest discussion which discerns it, identifies it, clears it and establishes it, is a form of worship of real honor of God and of true service of man. We, therefore, pray your Grace not to discourage it.

I had the pleasure to receive a reply from the Duke of Argyll, in which he said that "I had written under a misconception, as his observations on pulpit criticism had no reference to any thing but spoken sermons—not formally published and of which there is no authorized report." These the Duke would "treat as privileged communications not addressed to the general public, but to special congregations. When the clergy enter on the field of literature by published writings," his Grace regards "their teachings as open to comment and controversy." The Duke adds that "he now-a-days never sees among the clergy the

spirit of personal bitterness which seems to animate my letter," and he "feels sure that truth can never be reached without some candor, calmness and reasonableness of spirit, both as regards the subject matter and as regards the feelings towards those from whom we differ." As respects these qualities of "candor, calmness and reasonableness of spirit," as conditions necessary in the search for truth, I quite agree with the illustrious writer. Consideration for the feelings or even intellectual rights of others have seldom been a Christian virtue. It is happily now becoming more common, but the degree in which the Duke of Argyll possesses it is far from being general.

I made frank acknowledgment to his Grace for the courtesy of his letter, adding that "I counted it a great influence in favor of truth that his Grace regards the published writings of the clergy as open to controversy." For reasons I have stated, I am still of opinion that sermons are serious assaults upon the understanding and emotions of congregations, who are without the protection of criticism. My letter concludes as follows:

It was certainly a lack of art on my part to give your Grace the impression that I wrote in "bitterness," which is not in my mind. It is my good fortune to possess the friendship of many famous priests, clergymen and ministers for whom I have real respect and, for some, affection. This does not prevent my seeing their errors of conviction and duty; nor prevent them discerning and dissenting from mine. Many clergymen are gentlemen as well as Christians, but more are Christians only. With the nobler sort of priests controversy is considerate and fair, which is the manliest form of propagandism. Worship is every man's right, undisturbed and unquestioned—but preaching is no man's right, unless he concedes to the hearer the self-defense of inquiry or reply. Controversy should be relevant, unimputative and decorous—and from whom can this be expected so well as from priests, who have supernatural advantages over their secular hearers? They should be able to regard the errors of men as the physician does diseases, and after like passionless inspection and inquiry, the clergy should apply the remedy of instruction in truth. Foolish discussion may destroy the moral of a fine discourse, but this depends upon the preacher and the public want of discipline in debate, which only habit can give. Some years ago I published a little history of a trial which befell me. I was indicted, tried and sentenced to six months' imprisonment by a judge distinguished for his Christian, ity—and this not for words published, nor voluntarily spoken, not for words premeditated, but simply given in debate in answer to a question. Even if I felt it, some "bitterness" would be pardonable in one who lives under a state of law maintained by the Christian priesthood, which gives them absolute immunity, say what they may, and inflicts serious penalties upon those who may in self-defense give utterance to their equally rightful opinions. Since, however, debate is the only protection of truth, I am in favor of discussion under whatever disadvantages; nor do I see the validity of objection on the part of any who agree with St. Paul that we should "prove all things; hold fast that which is good."

GEORGE JACOB HOLYOAKE.

FREE-THOUGHT EDUCATION.

To the Editors:

ORANGE, N. J.

I must own that I am agreeably surprised by the interest which my brief article on *Free-thought Education* has aroused—and am led to hope that it may at last result in something practical. My critic, Mr. Jappe, finds fault with me for suggesting a *college*, and not a *lyceum*, unaware, apparently that *college* is the more usual, and if he will permit me to say so, the more correct term. We speak of *Eton College*, not of *Eton Lyceum*. (Compare Matthew Arnold's articles on *A French Eton*; also Webster's *Dictionary*). He seems to know only the ordinary American meaning of the term *college*. In any case, we both mean and desire the same thing, and we shall not quarrel over words.

I am entirely agreed with Mr. Leaby, and quite as wide-awake as he, to the necessity of rousing the free-thinkers of America to united action in the matter of education. But I am too well acquainted with them to have much faith that they will soon display any such action on a large scale. My hope lies in inducing a small number of the more silent and earnest among

them to unite and form a college in the true sense,* and so to rear a generation of free-thinkers who shall be doers, and not mere talkers, as the present generation so largely is.

The Free-thinkers' Magazine has done me the honor to reprint my little article as an editorial, and the editor has requested me to express my views on Free-thought Education, at greater length for that periodical. I have accordingly done so, and the result will appear in the next number. I need not repeat what I have said there. I would only repeat my appeal to all liberal men and women in this land, to bestir themselves, and do something in behalf of the cause which they profess to sustain, and to aid in redeeming men and women from a stupefying, degrading and hypocritical superstition, and in restoring them to the liberty of reason and science. I have no idea of establishing anything to compete with Harvard or Yale. The evil done by unfree-thought education is done long before young men reach institutions of that grade. What I am advocating can be begun on a small scale and with moderate means; in fact, with one teacher and one pupil. The American passion for bigness could only be prejudicial to it. I am amused to see that so many people think free-thought a form of sectarianism. To me free-thought means a reverent acceptance and following of all clearly demonstrated truth, and I hardly think that the unprejudiced followers of that could fairly be called a sect, or their tenets sectarian. But perhaps I am wrong.

I have not the smallest desire to make my name prominent in this matter; for all popularity, and all quest for popularity are unspeakably hateful to me; but, until an abler leader can be found, I am willing to do what I can to help this most important movement through its pioneer stage. If I can, in any measure, succeed in doing this, I shall then be most ready to transfer the work to worthier and stronger hands.

I am now endeavoring to work out the plan of a complete system of Free-thought Education. When finished and printed, it will make a large pamphlet, almost a book, and I shall endeavor to give it a wide circulation. If it does nothing else, it will, at least, call out an expression of opinion.

If the friends of Free-thought Education, instead of wasting time in talking and disputing, will come forward, and say what they are willing to do, what efficient aid, in the way of means or work, they are willing to lend, then we shall be able to make a beginning at least, and, as the Scotch say, a work begun is half-ended.

What we really want is a kind of Co-operative Pedagogical Province, a miniature society, in which young persons may be trained for the great society of humanity. Might it not be well to reprint in THE OPEN COURT, the delightful account given by Goethe (the apostle of *Free-thought Education*) of the "Pedagogical Province" visited by his Wilhelm Meister? (*Wanderjahre*, Book II.)

Let us have at once an association calling itself *The Free-thought Education Society*. Let it be incorporated; let it collect funds, seek out capable directors and instructors, and set to work to found a Free-thought College, in some healthy country place. If persons willing to spend and be spent in such an enterprise, will send their names to me, *stating at the same time what they are willing to do*, I will call a meeting of them, in the course of the summer, at some convenient time and place, and then the whole matter can be thoroughly discussed. THOMAS DAVIDSON.

The twentieth annual meeting of the Free Religious Association will be held in Tremont Temple, Boston, May 26 and 27, commencing on Thursday, May 26, at 7:45 P. M., in Vestry Hall, 88 Tremont st., with a Business Session for hearing reports, electing officers, etc. F. M. HOLLAND, Secretary.

* Webster defined *College* as "A society of scholars incorporated for the purposes of study or instruction." This is precisely what I want.

BOOK REVIEWS.

THE RELIGIOUS SENTIMENT: Its Source and Aim, a Contribution to the Science and Philosophy of Religion. By Daniel G. Brinton, A.M., M.D. New York: Henry Holt & Co., 1876.

The author says in the preface: "The 'science of religion,' as we know it in the works of Burnouf, Müller and others, is a comparison of systems of worship in their historic development. The deeper inquiry as to what in the mind of man gave birth to religion in any of its forms, what spirit breathed and is ever breathing life into these dry bones, this, the final and highest question of all, has had but passing or prejudiced attention. To its investigation this book is devoted."

Mr. Brinton approaches his subject analytically and by the inductive method. The main questions of his inquiry are: "What led men to imagine gods at all? What still prompts enlightened nations to worship? Is prayer of any avail, or of none? Is faith the last ground of adoration, or is reason? Is religion a transient phase of development, or is it the chief end of man? What is its warrant of continuance? If it overlive this day of crumbling theologies, whence will come its reprieve?"

Mr. Brinton's ways of thinking are decidedly monistic. He introduces Oken's dictum: *Mind is co-extensive with organism*, and he quotes Wilhelm von Humboldt's words: "The old dualism of mind and body which for centuries struggled in vain for reconciliation, finds it now, not indeed in the unity of substance but in the unity of laws." And Mr. Brinton says (on page 8), "Wherever we see form preserved amid the change of substance, there is mind." In both quotations and in many other passages of his book, Mr. Brinton accepts, and nothing short of it, the fundamental principles of monism, although he never uses the word.

Treating in Chapter I, of the laws of mind and thought, Mr. Brinton proposes that the logical law of the excluded middle is the keystone of religious philosophy. He objects to Mr. Spencer's view of the unknowable. "Those philosophers," he says on page 39, "such as Herbert Spencer, who teach that there is some incogitable 'nature' of something which is the immanent 'cause' of phenomena, delude themselves with words. The history and the laws of a phenomenon *are* its nature, and there is no chimerical something beyond them. They are exhaustive. They fully answer the question *why* as well as the question *how*."

The second chapter is devoted to the emotional ingredients of religious sentiment. Fear, hope and love are its chief elements and the part sexual love plays in religions, receives full appreciation. But religion is not merely an affair of feelings. It must assume some rational postulates which involve, as explained in Chapter III, that there is an intelligent order in the world. "Thus we reach the foundation for the faith in a moral government of the world, which it has been the uniform characteristic of religions to assert." Bunson expresses it, as quoted on page 109, "The faith of all historical religions starts from the assumption of a universal moral order, in which the good is alone the true, and the true is the only good."

Prayer, in Chapter IV, is claimed to have a positive effect on the mind, joyful emotions are its fruits, *spiritual enlightenment*, as religious people call it, its reward. The answer to prayer, it is claimed by religious minds, comes by inspiration which Mr. Brinton calls *entheasm*.

In Chapter V, religious myths, in Chapter VI, the cult, its symbols and its rites are treated. As the momenta of religious thought are named in Chapter VII: (1) the idea of the perfected individual; (2) the idea of the perfected commonwealth, and (3) the idea of personal survival. The last of these three ideas is decreasing as a religious moment owing to a better understanding

of ethics, to more accurate cosmical conceptions, to clearer definitions of life and to the increasing immateriality of religions. Mr. Brinton declares the doctrine of personal survival to be egotistic and "the spirit of true religion," he adds, "wages constant war with the predominance or even presence of selfish aims."

We sometimes miss, for instance in Chapter I, a definite and clear statement of the author's own views, we also differ from his views in many details, and, concerning the high aim he has proposed to himself, it may be doubted whether he has satisfactorily answered all the questions of his problem. But the spirit and general character of the book must impress the reader with the earnestness and scholarship of its author and with the fact that his work contains most valuable contributions to a right understanding of religion and religious sentiment. PAUL CARUS.

ABSOLUTE RELATIVISM; OR, THE ABSOLUTE IN RELATION.
By William Bell McTaggart. London: W. Stewart & Co., 41
Farringdon street, S. E. Vol. I, pp. 133.

The object of this work is to examine the leading systems of philosophy and to show that, while none of them have represented the entire truth, they have all been stepping-stones to truer and better thought. The various religions and philosophies are regarded as facets reflecting some portions of the truth. The valuable elements of each, with its errors omitted, our author attempts to combine in a synthetic philosophy, which he calls "Absolute Relativism."

We can only indicate the leading train of thought. The materialist says that the ego and the non-ego are manifestations or functions or potentialities of matter. The idealist says that ego is mind, and non-ego is matter; that all the qualities of what is termed matter are shown in the last analysis to be properties of mind, and that the stimulus, or "otherness," necessary to mind before it can have cognition of even itself, must be mind.

Mr. McTaggart holds that a proposition can be formulated which will be acceptable alike to careful thinkers, whether they call themselves materialists or idealists. The philosophical necessity of postulating some stimulus to which the mind responds prior to effect, some "otherness" from which the mind may distinguish itself, some impulse to which the mind may respond, must be admitted. The materialist says this stimulus is only matter; the idealist affirms that it is only mind. Mr. McTaggart tells the materialist that matter is regarded by all schools of thought as unknowable *per se*, "for the reason that it cannot be known out of mentation. A green leaf, for example, does not exist in the universe apart from the power of mind" (for the reason that color, form and substance are words which stand for conscious states, modes in which our consciousness is affected).

To the idealist the externality or stimulus is just as inscrutable. "May not this stimulus or irritation be internal, a feature or potentiality of the mind? May not, in other words, the mind be its own stimulus and response to stimulus? An adequate consideration will show us that it may not. Given the mind in unity as alone the generator of all things, then it must forever remain blank and dark, silent, infertile. Why? Because if we consider what we mean by production in its simplest form, it is equivalent to change. But what is change? It is something that was not there before; some force, some movement has arisen which makes the ego different from what it was before. * * * The force may be postulated as being *in* the ego since the beginning; but what started it out of potentiality into activity? What set the ferment going? Clearly something not there before; but, if the ego was all in all, the absolute, then there was, and is, nothing else to set this ferment in motion. No appulse, no impulse can arise; for there is nothing,—no when, no where,—to so arise to disturb the balance or alter the eternal equation. * * * Much, nay, most, may be the ego; but that there is an actuality, a something,

outside and beyond as the non-ego, is a demonstrated certainty."

The mistake of the idealist consists in the fancy that mind must stimulate itself, and be the be-all and end of creation. The doctrine that there is no difference between the ego and the non-ego by making the two identical, destroys all possibilities or potentialities of them both. To this *impasse* comes also the materialist at the same crucial point of the investigation. If matter,—that is, ultimate homogeneous atoms, each endowed with necessarily equivalent force,—is all in all, then can there be nothing to set the ferment going. Mass and motion, passivity and activity, action and reaction, this dual principle is the great underlying verity.

There is an externality, a stimulus, as in the case of a tree, which has the power of again and again stimulating the mind, so that fresh ideas are evolved whenever the occasions occur. Turned in upon itself mind or matter remains unfertilized, unfertilizable.

The common truth of materialism and idealism is that "otherness" exists; that other minds and other existences also, modified, idealized, created, in a sense, by ourselves, but existing outside and beyond our mentation, each after its own fashion notwithstanding. As a corollary thereto, without stimulus no mind, and without response to stimulus no body, or without stimulus, contained within the unknown *x*, no mind. Without response to stimulus, contained within the unknown *x*, no body. "Stimulus or the underlying principle of otherness, is of the unknown substratum, or philosophers' matter. Response to stimulus, or the underlying principle of self or identity, is of the unknown substratum, or philosophers' matter. Mind is a compound of unity; it is stimulus plus response to stimulus, which, as a phase of the unknown *x*, or matter, the basis of mind is demonstrated to be something or other apart from mind. Mind can know mental manifestations, ideas only; but in these ideas there is discoverable an actuality of otherness which gives rise to what we term the physical and extended.

"'No mind no body,' has been proved as the truth; but no mind no matter, can by no means be allowed to pass. Matter, the unknown *v* in the phase or activity of stimulus, must, as we have seen, be admitted as a thing apart; for mind alone, unfertilized, unenergized, remains forever unconscious of itself, a potentiality, but nothing more."

We give but the merest outline of the thought presented in this volume, which is to be followed by others to be devoted to an exposition of the author's "Absolute Relativism," "the selected name for a system which, it is hoped, may offer a new departure for philosophic thought, and to an analytical examination of the sociological outcome of the various creeds of the past, with an effort to point out the logical nexus between."

The author is constructive in his method, reconciliative in spirit, keen in analysis, respectful to all schools of thought, yet independent in criticism and approval of the views of other thinkers, and vigorous and lucid in style. Without going into detail, we are free to say that we regard the work as an able and valuable contribution to the philosophic discussion of the day.

THE PIONEER QUAKERS. By Richard P. Hallowell. Boston: Houghton, Mifflin & Co., 1887.

This little book of 98 pages embodies the gist, in the form of a lecture, prepared by request for a Boston Literary Club, of the history of the Quakers as given in the author's larger work published in 1883, *The Quaker Invasion of Massachusetts*, with additional notes bringing that history down to a later period. Eight pages of index show the variety of topics treated in this lecture and more than a dozen authorities are quoted, which appear not to have been consulted in the larger work. The work marks an epoch in the history of American free-thought.

ON MEMORY AS A GENERAL FUNCTION OF ORGANIZED MATTER.*

AN ADDRESS DELIVERED ON OCCASION OF THE SOLEMN MEETING OF THE IMPERIAL ACADEMY OF SCIENCES, AT VIENNA, MAY 30, MDCCCLXX.

BY EWALD HERING,

MEMBER OF THE IMPERIAL ACADEMY OF SCIENCES.

Translated by Dr. Paul Carus, from the Second Edition, published by Carl Gerold's Sohn, Wien, 1876.

(Translation Copyrighted.)

Part II.—(Concluded.)

Now let me finally consider those facts in which the strength of memory in organized matter strikes us most powerfully.

On the basis of numerous facts, we may justly assume that even such qualities of an organism can be transferred to its posterity as have not been inherited but were acquired under peculiar circumstances of life. Thus every organic being endows its germs with some small inheritance which was acquired during the individual life of the parental organism and is added to the greater heirloom of the whole race.

Considering that properties were inherited which had been developed on diverse organs of the parental being, it appeared highly enigmatic how these same organs could have influenced the germ which developed in some distant place. So it happened that as a solution of this problem mystic views were often propounded.

The subject may be best comprehended from a physiological standpoint in this way:

The nervous system in spite of its being a composition of many thousands of cells and fibers, nevertheless forms one coherent entirety. It is in communication with all organs; according to later histological researches, it is assumed that it is connected even with every cell of the more important organs, be it directly or at least indirectly through a living, irritable and therefore conductible cell substance. By means of this connection, all organs, it is possible, are more or less interdependent, so as to make the destinies of one re-echo in the others; and if in any way some irritation takes place in one, it is transfused if ever so feebly, to the remotest parts of the body. In addition to this delicate communication of all parts through the nervous tissue, another, a slower and more sluggish communication takes place, that of the circulating fluids.

* Presented to the readers of THE OPEN COURT as part of his Monistic views, by Edward C. Hegeler.

We notice further on that the process of development of the germs which are destined to attain an independent existence, exercises a powerful reaction upon both the conscious and unconscious life of the whole organism. And this is a hint that the organ of germination is in a closer and more momentous relation to the other parts, especially to the nervous system, than any other organs. In an inverse ratio, the conscious and unconscious destinies of the whole organism, it is most probable, find a stronger echo in the germinal vessels than elsewhere.

This is the path it must be recognized, on which we have to look for the material link between the acquired properties of an organism and such quiddities of a germ as may redevelop the parental qualities.

You may object that an immaterial something cannot be the determinative for the future development of germs so like each other, it must rather be the peculiar character of its material composition. But I answer: The curves and planes which a mathematician imagines, or accepts as imaginable, are more numerous and manifold than the shapes of the organic world. Let us imagine almost infinitely small fragments of all possible curves; they will bear a closer resemblance to each other than one germ does to another. Nevertheless the whole curve is latent in each fragment and suppose a mathematician extends it in its directions, it will grow into the peculiar curve which has been determined by the form of its small fragmentary part.

Therefore it is erroneous to declare that we cannot imagine such minute differences in germs as in this case must be assumed by physiology.

An infinitely minute dislodgment of a point or a complex of points in the fragment of a curve will alter the law of its entire course. Exactly so an evanescent influence of the parental organism upon the molecular structure of its germ suffices to regulate its whole future development.

Now, then, the reappearance of properties of the parental organism in the full grown filial organism can be nothing else but the reproduction of such processes of organized matter, as the germ when still in the germinal vessels had taken part in; the filial organism remembers, so to say, those processes, and as soon as an occasion of the same or similar irritations is offered, a reaction takes place as formerly in the parental organism,

of which then it was a part, and whose destinies influenced it.

If in a parental organism by long habit or constant practice something grows to be its second nature, so as to permeate, if it were ever so feebly, also its germinal cells, and if the germinal cells commence an independent life, they aggrandize and grow till they form a new being, but their single parts still remain the substance of the parental being, they are bones of its bones, and flesh of its flesh. If, then, the filial organisms reproduce what they experienced as a smaller part of a greater whole, this fact is marvelous indeed, but no more than when an old man is surprised by reminiscences of his earliest childhood. Whether it be the very same organized substance still which reproduces old experiences, or whether it be its descendant and offspring, a part of itself, which in the meantime deployed and grew, is a difference which, apparently, is one of degree, not of kind. Now, is it not strange that we are engaged at all in considerations, how trifling inheritances of the parental organism can be reproduced in the filial being, as if we had forgotten that the filial organism is nothing but one great reproduction of the parental organism, even in its minutest details? This is because we are so accustomed to accept their similarity as granted, that we are astonished at finding a child who is to some degree not quite like its mother, and yet the fact of its being in so many thousand ways like its parent is much more wonderful!

If the substance of a germ is able to reproduce what the parental organism acquired during its individual life, how much more will it be able to reproduce what is innate in the parental organism and has been repeated through innumerable generations in the same organized matter of which the germ of to-day, after all, is, and remains but a part. Is it then to be wondered at, that those things which organized matter has experienced on numberless occasions are impressed stronger into the memory of a germ, than the incidents of one single life? Every organic being which lives to-day, is the latest link of an immeasurable series of organic beings, of which one rose into existence from the other, and one inherited part of the acquired properties of the other. The beginning of this series, it must be assumed, are organisms of extremest simplicity like those which are known to us as organic germ cells. In consideration of this, the whole series of such beings appears as the work of the *reproductive faculty* which was inherent in the substance of the first organic form with which the whole development started. When this first germ divided, it bequeathed to its descendants its properties; the immediate descendants added new properties and every new germ reproduced to a great extent the *modi operandi* of its ancestors; part of which grew

feebler, because under altered circumstances their reproduction was no longer elicited.

Thus every organized being of our present time is the product of the unconscious memory of organized matter. Constantly increasing and dividing, constantly assimilating new and excreting waste matter, constantly recording new experiences in their memory in order to reproduce it over and over again, it was shaped richer and more perfect the longer it lived.

The whole history of an individual development as observed in a higher organized animal is, from this point of view, a continuous chain of reminiscences of the evolution of all those beings which form the ancestral series of this particular animal. A complicated perception takes place through a volatile, and, as it were, a superficial reproduction of cerebral processes which have been practiced long and carefully; exactly so a growing germ passes quickly and summarily through a series of phases which were developed and fixed, step by step, in the memory of organized matter in the series of its ancestral beings during a life of incalculable duration. This view was preconceived repeatedly; it took shape in various theories, but was rightly understood by one scientist of later days. For truth hides in different shapes before the eyes of its aspirers until it is revealed to the elect.

A body, an organ, or a cell reproduces simultaneously with its shape as well as with its interior and exterior formation, also its functions. A chick which creeps out of its shell at once runs about, as did its mother when she, as a chick, had broken her shell. Imagine how extraordinarily complicated are the motions and sensations of such acts! Only consider the difficulty of equipoising its body in running, and the supposition of an innate reproductive faculty alone, it must be conceded, can serve as an explanation of these intricate performances. The execution of some motion which was exercised during the greatest part of an individual life becomes second nature, and the actions of a whole race which are repeated over and over again by each member of the race must also become second nature.

The chick is not only endowed with an inborn skill concerning its motions, but possesses, also, a strongly developed perceptive faculty. Without hesitation it picks the grains which are thrown to it. This implies that it sees them, that it correctly conceives the direction of their situation and their distance; moreover, it has to move its head and other limbs with great precision. All these things could not be learned in the egg-shell; they have been learned by those many thousands of beings which lived before this chick, and of which it is the direct offspring.

The memory of organized matter is strikingly recognizable in this instance. Such a feeble irritation as the rays produce which proceed from a grain and fall upon

the retina of the chicken, becomes an occasion for the reproduction of a complicated series of sensations, perceptions and motions, which in this individual never as yet had been combined, and which, nevertheless, from the beginning were arranged with accuracy and precision, as if the very same animal had practiced them thousands of times. Such surprising performances of animals are generally called instincts; and some physicists indulged in mystic explanations of instincts. If instinct is considered as the result of memory, or reproductive faculty of organized matter, if we assume that also the race is endowed with memory, instinct is comprehended at once, and the physiologist is enabled to insert instinct into and connect it with the one great series of such facts as were found to be the phenomena of a reproductive faculty. In this way we have not yet gained, but certainly we approach, a physical explanation of the problem.

If, for instance, a caterpillar changes into a chrysalis, or if a bird builds a nest, or a bee constructs a cell, such animals obeying their instincts act with consciousness and are no unconscious machines. They know to some extent how to alter their actions under changed circumstances and are liable to err; they feel pleasure if their work proceeds and displeasure if they meet obstacles. They learn by working, it must be assumed, and birds, no doubt, build their nests better a second time than first. But if animals so easily find the most practical means of attaining their ends the very first time, if their motions are so excellently and perfectly adapted to their purposes, it is due to the inherited tenor of the memory of their nervous substance which only awaits an occasion to work in full conformity with the situation, and remembers just what is necessary for that occasion.

It is striking how easily dexterities are acquired if sufficient limitation is exercised. Onesidedness produces virtuosity. He who admires a spider for spinning his cobwebs, should bear in mind how limited are his other faculties. Nor should we forget that he did not learn his art himself, it was acquired in slow degrees by innumerable generations of spiders, and this art is almost all they learned. Man takes bow and arrows if his nets fail to catch food, the spider must starve.

Thus the body, it is seen, and what is of greater import, the whole nervous system of a newborn animal is prefigured and predisposed for its intercourse with the surrounding world into which it enters; it is prepared to respond to irritations and influences in the same way as was done by its ancestors.

We cannot expect that the brain and nervous system of man is an exception from this rule.

Certainly man must learn with difficulty, while the animal from its birth is finished in its instincts; however, the human brain immediately after birth is at a much greater distance from the pitch of its development than

the brain of an animal. Its growth not only takes longer time, but is much stronger. The human brain, we may say, is much younger when it enters into the world than the animal brain. The animal is born precocious and at once behaves precociously. It is like a phenomenal child whose brain is overmatured and too old as it were, so as to be unable to develop as richly as does another brain which is less finished and inured to work but fresher and more youthful. The scope for the individual development of the human brain and generally of the human body is much larger because a relatively great part of its development lies in the time after birth. It grows under the influences of its surroundings which affect its senses, and acquires under such circumstances in a more individual way, what an animal has received in the fixed formation of its race.

A far-reaching memory, or reproductive faculty, we must take it as granted, is to be ascribed to the whole body, as well as particularly to the brain of a newborn man. By dint of this memory he is enabled to learn those attainments which were developed in his ancestors some thousand times and are necessary for his life, much quicker and easier. What appears to be instinct in animals, in man appears, in a freer form, as a predisposition. Certainly ideas are not inborn in an infant, but the ability of the ready and precise crystallization of ideas from a complicate mixture of sensations, is due not to the labor of the child, but to the labor of innumerable ancestors.

Theories of individual consciousness, according to which it is assumed that each human soul starts life for itself and commences a development of its own, as if the thousands of generations before had been in existence in vain, are in a striking discord with facts of daily experience.

The realm of those cerebral processes which elevate and distinguish man, it must be conceded, is not of such antiquity as is the province of the more physical necessities. Hunger and procreative impulse have been stirring even the oldest and simplest forms of organic beings. Accordingly organic substance has the most powerful memory for these stimuli, as well as for their satisfaction. The impulses and instincts rising from them take a firm hold even of the man of to-day with elemental power. Spiritual life grows slowly, and its most beautiful blossoms belong to the latest epochs of the evolutionary history of organized matter. It is not yet long that the nervous system is adorned with the ornament of a grand and rich brain.

Oral and written traditions have been called the memory of mankind, and this conception is true. But beside it there is another memory, which is the reproductive faculty of the cerebral substance. Without it, all written and oral language would be empty and meaningless to later generations; for, if the loftiest ideas were

recorded a thousand times in writings or in oral traditions, they would be nothing to such brains as are not predisposed for them. They must not only be received, they must be reproduced. If an increasing cerebral potency were not inherited simultaneously with inner and outer development of brain, with the wealth of ideas which are inherited from generation to generation, if an increased faculty of the reproduction of thoughts did not devolve upon coming generations simultaneously with their oral and written traditions, scripts and languages would be useless.

The conscious memory of man dies with his death; but the unconscious memory of nature is faithful and indestructible. Whoever succeeded to impress the vestiges of his work upon it, will be remembered forever.

PERSONAL IMMORTALITY.

BY DANIEL GREENLEAF THOMPSON.

Is there any sufficient reason for the belief in the continuance of personal mental life after the change we call death? Unless this question is answered in the affirmative, we have no possibility of verifying any hypotheses of a supernatural world nor, indeed, any interest in ascertaining their truth or degree of probability. But assuming that there is such a continuance, we have the possibility, at least, of forming a scientific hypothesis (that is, one capable of verification) in regard to a world beyond.

I make no account of alleged resurrections from the dead nor of oral or written communications claiming to come from a supernatural sphere. Let those believe who can; I do not. And there are plenty of disbelievers as to all these claims. What the world wants to know is, have we scientific evidence upon which to found a rational belief or disbelief upon this question? If the preachers would only turn scientists and come and help us, leaving authority behind them, how admirable it would be! Some of them are trying to do this, God bless them, but the majority are obstructionists.

Now, there are two directions in which the methods of science can be employed with reference to this subject. Both are methods of observation and experiment, principally the former. One is introspective observation of the facts and laws of the human mind, the other is extrinsic observation of what we are accustomed to call the external world. From the latter we get all the knowledge we have of death. What conscious life is we only know by subjective experience. Regarding consciousness introspectively, we find ourselves unable to think even an interruption of consciousness, much less its total and final destruction. It will at once be allowed that the individual cannot remember the time when I was not I. Closer examination reveals that I cannot even suppose a time when I was not, nor am I able to conceive that I can cease to be. To declare either

involves a contradiction in my thought. If we had none of the evidence of disappearance and disintegration which is involved in the death of others, we should never have the thought that our conscious mental life could cease, nor even if one were at the point of death would such an idea be possible for him to entertain.

When, however, we look upon the world about us, we see beings seemingly endowed with consciousness like our own. Thus we are compelled to infer and we reason accordingly. In the first place, we notice with all these beings that the signs of conscious life are periodically absent as in sleep, or irregularly suspended as in swoons. Consciousness is interrupted. We even infer this with respect to ourselves by the observation of changes for which we cannot account upon any other supposition. Secondly, we frequently behold an enfeeblement of mental powers, proceeding concomitantly with bodily decay and tending toward a total extinguishment. Memory is often lost, the power of ratiocination likewise and also self-control. Then come the extremes of mania and idiocy. All these diseased conditions indicate diseased conditions of the nervous system. As just pointed out we learn that consciousness can be interrupted. Now we are forced to ask, if mind is progressively impaired as the nervous structure is disintegrated, does not the total disintegration of the latter irresistibly argue the total destruction of the former? And as a matter of fact, when death arrives, the evidences of conscious personality all disappear, the flame goes out and is not relighted. Then follows a complete disintegration of the organized body, in connection with which we knew this personality. We are not able to trace any dissolution of mind, further than just stated, that is, its evidences disappear. Life ceases and with it mind ceases to be manifest to us; the body is disintegrated and the processes of this disintegration we can follow to a considerable extent.

The phenomena of the so-called external world are interpreted by the best scientific intelligence under those laws which have for a nucleus the persistence of force of Mr. Herbert Spencer. Technical physical science having attached a more specific and limited meaning to the term *force*, many would prefer the expression *conservation of energy* to the one above employed. This latter doctrine is that when one kind of energy disappears, energy of some other kind is produced, and that in the transformation, nothing is lost quantitatively; or in words of the other formula, forces are mutually convertible at given rates and in the conversion no force is lost. Involved with this truth are the truths that force is persistent, matter is indestructible and motion is consecutive or persistent. When for instance, the ball strikes the rock the mechanical motion, or some of it, is changed into thermal motion. Mechanical force ceases and heat is evolved. Now, in the progress of scientific knowledge,

we give a name to each definite unanalyzable form of force or energy and assign to it an indestructible reality which we express in such ways as just remarked. We are compelled to do this by the conditions of all knowledge. If, then, mechanical force, A, disappears and energy as heat, B, appears, in the disappearance of A we cannot put it out of existence. We say A and B are correlated; this means that they co-exist and under proper conditions A can be made to reappear. If this were not so, something could become nothing, matter could be destroyed, motion could be annihilated and force would not be persistent. Suppose, then, that the form of organizing energy, which we call life, be indicated by C, while A and B symbolize the mechanical and chemical forces of the inorganic world; if A and B are correlated with C, the conversion of A and B or either of them into C, or of C into A or B, means in the one case the disappearance of A or B and the appearance of C; in the other the converse. When C disappears we cannot by any possibility of thought annihilate it. If it be a distinct reality, it co-exists with A and B, is persistent, abides somehow and somewhere. Then by parity of reasoning, if consciousness is a form of physical energy, D, and is correlated with C, B, A, any or all of them, we have no more power of thinking of its destruction than we have of the destruction of any other form of energy. D disappears, but if in anywise dependent upon C or B, or A, under the laws of persistence or transformation of energy, it still exists. It has disappeared, but under proper conditions it will come back and be manifested as before. So far forth then as consciousness is to be interpreted by the phenomena of the world external to the ego, it must be interpreted by the laws of the conservation of energy and so far forth as explained by those laws it must be held as indestructible. Certainly if consciousness be material, it is forever persistent. The necessity of correlated forces being co-existent has been overlooked by philosophers and scientists.* If force A is transformed into force B, either A still exists, though it has disappeared, and can under appropriate conditions be made to reappear, or an act of annihilation and special creation has been performed as inexplicable as any that theologian ever asserted.

However much information we may derive from a study of the world outside consciousness, it is clear we cannot get along without introspection even in attaining a scientific knowledge of external objects. Indeed, if we reflect carefully, we shall soon find the idea suggesting itself that there are in strictness no "external" objects, but I do not think the use of the term is upon the whole objectionable. At all events, when we come to

*Lest the reader may think my ideas upon this point are not the result of sufficient thought, I shall be obliged to ask pardon for referring to my *System of Psychology* (London, 1884), Vol. 1, Chap. XVII, where this whole topic is more fully discussed.

inquire what constitutes an ultimate form of energy we discover that it is determined entirely by the answer that is given to the question, what are the ultimate modes of sensibility? Heat, we say, is a mode of motion. Motion, however, is understood only with reference to the muscular sense. Certain vibrations there are, to be sure, antecedent to the sensation of warmth; but all the vibrations in the world will not give heat unless there is contact with certain nerves so formed as to develop that sensation. And though we may try to explain heat in terms of motion according to the law of correlation, we can in fact only explain it by itself. It may be produced by material motions, but in last resort, heat is heat and not the sensation of the muscular sense. Similarly with light and with sound. We are in each case driven back to certain ultimate varieties of sensation. And this is our court of last resort.

Our course of investigation thus must needs pass from the material to the mental sphere. Here we at once discover that a state of consciousness is only to be explained by itself in any of its aspects. A feeling is a feeling, a cognition is a cognition. But though each of these is an ultimate and unanalyzable aspect of consciousness, which itself can be resolved into nothing but consciousness, we can observe how states of consciousness are related and propose to ourselves the problem,—How is knowledge possible? One thing is speedily disclosed; that is, there can be no consciousness without representation. It is necessary for perception, even. Equally is it indispensable for all purposes of comparison. A sensation occurs and is followed by another; we are wholly unable to make any comparison between the two without reproducing the first; we can say that B, which is present, is unlike A, which has departed, only representing A in fainter form, *a* for comparison. Memory is everywhere necessary to conscious mental life.

How we know an experience as representative is the mystery of mysteries. Stuart Mill thought it inexplicable and no one has succeeded in resolving the experience into anything more ultimate. How do I know that the cognition *a* is representative of a sensation A, which once occurred to me? How do I know I saw a horse running away while I was walking yesterday? There is no answer save that I remember it. In other words, representative experience is primordial and ultimate, in the same meaning that sensational experience is ultimate.

But see what this involves. It implies not merely a continuity but a unity of personal existence. In recognizing a feeling as the same feeling I had yesterday I have the idea of self present; of self having a feeling yesterday; consciousness of agreement between the two selves and the two feelings. I cannot distinguish the presentations to my mind as having been made before, or in other words, I cannot distinguish a past experience

actual, from a simple thought of that experience as possible, except by postulating that the experience actually occurred to *me*—an ego enduring through all change, and itself conditional for all successions.* Thus consciousness universally implies a synthetical unity without whose permanence no coming and going of phenomena in experience can be thought as possible.

The correspondence between the train of presentations and that of representations, or, as the old psychologists used to say, of sensations and ideas, is perfectly well marked. The succession of representative objects is governed by a series of laws similar to those which govern the determination of presentative objects. And these same dicta that force is persistent, matter is indestructible, motion is consecutive, and energy is conserved, find their exact parallel in the science of mind, though there is no power of thought to identify matter with mind, the presentative with the representative. Memory brings these trains of representative objects, each involving a knower, a knowing, and a known. They disappear, but so far forth as they have a distinct unity so as to be objects to consciousness at all, they cannot be thought out of existence. They co-exist with the presentative experiences and when they are thought of, they are, of course, thought of as existent, this thought as just seen postulating personal identity of a present self with a self as existing in the past; and as for a beginning or an end of the series, as before remarked, it is quite impossible to think it.

Thus a reference to mental phenomena, in order to understand material, forces us to a doctrine of the persistence of the individual consciousness. And such a reference appears inevitable. We can have no knowledge of matter, force, motion or energy without representation; and this last is conceded to be purely mental; but it involves persistence of the ego.

It may be well to consider, for a moment, what we mean by destruction. A bird appears in the air before our eyes, and then disappears. We do not say that he is destroyed. On the other hand, when a black beetle is crushed by the foot of the passer-by, and life is extinguished, followed by complete disintegration of structure, we speak of the destruction of the insect. But, even in this case, as we are accustomed to reason, we do not allow that the *matter* composing the insect's organism is destroyed. Dust it was, and to dust it simply returns. What, then, is destroyed? The form, if you please; the something that made the beetle what it was, the life is gone. Gone to be sure; but how are we going to annihilate life any more than the particles of dust? And in view of what we have just been noticing in regard to representation, how is it possible that the form, the mental element, shall be destroyed either? So far forth as this insect is composed of particles of matter,

so far forth as its life is force or energy, its destruction is unthinkable. So far forth as its form is concerned, this being merely the mental apprehension of a subjective combining power, which is itself indestructible, we are unable to find destruction there; for we cannot think anything into nothing. It would thus seem that the disintegration, which we are wont to call destruction, is, after all, nothing but disappearance. We may not in experience meet with a reappearance, but we are bound to consider it, not only as possible, but as inevitable under appropriate conditions. In other words, what once *was, is*, somehow or somewhere and does not pass into nothingness.

Then it must be asked, how does it happen that if we cannot think of anything becoming annihilated people are all the while seemingly doing so, and there exists a necessity of argument to show their error? How come we to have the idea of something becoming nothing? A vacuum may be an impossibility, but how then have we the notion of a vacuum? The answer is found in the Universal Paradox of Knowledge—a paradox which is nevertheless the foundation of all cognition. Every positive implies a negative, which can only be thought in positive terms, which excludes the positive and is excluded from it but whose existence is equally necessary with that of the positive. The existence of the negative is conditional for the reality of the positive. For every A there is a not-A; for every finite an infinite; for every known an unknown. This truth is constantly lost sight of. Mistaken notions as to space are largely responsible for this; space is given in sensation as much as force, space and force being correlative sensations; space is a reality as much as is force. Similar errors are made with regard to time; duration is not considered, the attention of thinkers being concentrated upon succession. The reality and the certainty of unconscious mind are conditional for conscious mind. If this were not so, we should never be able to say that we have forgotten anything. By reason of this paradox, we are compelled to aver that a vacuum is a thing as much as a plenum; the former exists as much as the latter. But in the process of generalization, we make a universal "all things," which excludes "vacuum," but in this very exclusion we imply reality and positiveness in the latter. "Nothing" is the negative which is left in the mind when generalization and integration are carried to their farthest point. When, therefore, we say that something is nothing, we indeed contradict ourselves, since in forming the notion "something" we already exclude it from "nothing;" and when we declare that a "vacuum" exists, we seek to include it within a class of objects which have in their idea excluded it. But, nevertheless, we cannot get rid of the conclusion that when we have found our universal concept inclusive of everything there is still a something

**System of Psychology*, Chap. IX.

real and positive beyond. Thus when we declare that something has become annihilated, all we can mean is that it has passed from the perceptible into the imperceptible. When we propose to annihilate anything we can chase it away, and away, and away, till our mind gets tired; but the moment we stop, as stop we must, it is there at the end mocking us. To think a "vacuum" is thus an impossibility as a process of endless centrifugal mental motion. But if we mean by annihilation a disappearance, which is all that can be meant, it is possible to conceive of it. This is not, however, the meaning of terms as usually employed. They refer to this endless motion, and the conditions of logical thought necessitate this universal paradox.

The truth is we are forced by the laws of cognition to postulate an unknown reality behind the known reality, both of matter and mind, a dark side of the material world and of intelligence, an imperceptible substantive being, out of which somehow comes the perceptible, and into which it disappears, a source of both material and mental phenomena, a cause of their effects, a permanent in which alone change is possible, a possibility for all actualities and a power which transcends knowledge but which is presupposed in all knowledge. This is the meaning of the paradox.

The lines of argument as to the question of personal immortality thus converge. Whether we look without or within the mind, we come to substantially the same result. If conscious mind be a higher force superinduced upon the vital energies, then we must believe in conscious existence after death. If force be persistent, if energy be conserved, if motion is continuous, if matter is indestructible, then the conscious ego is indestructible, the mental processes are continuous, the power of apperception is conserved and persistent. On the other hand, if we look introspectively, we find it impossible to think even of an interruption of consciousness, while all the considerations derived from an observation of external nature have increased strength when we consider the trains of states of consciousness as mental objects. The conscious ego persists—that is the self-conscious ego—the knowing, feeling, willing ego, for we know no other. That is what mind means.

It is no harder to understand the continued existence of personal existence after death than to comprehend its occultation in sleep and restoration afterward. As before said, the sleeper knows, subjectively, no interruption; he infers it from changes in his environment. Its occurrence, however, is quite inexplicable; yet no one speaks of any impairment of personal identity because of it.

The greatest perplexity arises, perhaps, over the fact of the failure of memory. Without memory there is no personal consciousness, and we often observe a progressive impairment of the representative power. Memory

waxes and wanes according to bodily conditions. If, then, alterations of the nerve-structure in disease will abrogate memory, the total disintegration of that structure, it may be said, will remove the possibility of representation—at any rate until some re-integration takes place. If, while life continues mind may fail, how much more when life is extinguished must we be compelled to the belief that the individual consciousness has irrecoverably passed away. But, after all, this deterioration of memory is only concomitant with degeneration of vitality. Vital force wanes and, perhaps, there may be by-and-by just this reintegration of which we spoke. Vital force, though it has disappeared, exists somewhere. There may be a lacuna in conscious existence as in sleep; but do not the considerations before adduced impel us to the belief that there may be an awakening even after death to the conscious identity which says I am I, I was and I am?

On every side, from beginning to end, this subject is beset with difficulties; but altogether I am inclined to the opinion that the ground for the assertion of post-mortem personal self-consciousness in identity with ante-mortem self-consciousness is firmer than for the contrary belief.

But one thing more ought to be said before we close. The same arguments that support the belief in continued personal existence after death tend also to prove an existence before birth. Is it possible that we must return to the pre-existence doctrines of the ancient philosophers? Is it possible that we must each say, I am; therefore I always was and always shall be? *Dios sabe!*

Is it wonderful, in view of all these things, that mankind clings to the belief that the inquiry raised by intelligence must be answerable to intelligence, that some conscious being somewhere, at some time or somehow must understand these mysteries; or that they voice the song of Omar Khayyam—

"We are no other than a moving row
Of magic shadow shapes that come and go
Round with the sun-illuminated lantern held
In midnight by the master of the show,
But helpless pieces of the game he plays
Upon this chequer board of nights and days;
If ther and thither moves, and checks, and slays,
And one by one back in the closet lays,
The ball no question makes of ayes and noes,
But here or there as strikes the player goes;
And he that toss'd you down into the field
He knows about it all—he knows—HE KNOWS!"

JAILS AND JUBILEES.

BY ELIZABETH CADY STANTON.

The two questions just now agitating Great Britain are "Coercion" for Ireland, and the Queen's Jubilee—a tragedy and a comedy in the same hour.

The former is being hotly discussed in Parliament and by thoughtful people at every fireside. As the

English are by no means of one opinion on this question, the excitement and bitterness among contending factions, in public and private, remind one of the old days of slavery in the United States, when families, as well as churches and political parties, were rent in twain by the agitation. There has been so much said and written in regard to the condition of Ireland, that your readers need no recapitulation of the successive steps of tyrannical legislation, by which, through four centuries, England has at last completely subjugated a nation that was at one time the light of European civilization.

Down to the sixteenth century, Ireland, in her system of education and jurisprudence, was pre-eminently the great center of progress and learning. To her free schools and universities students flocked from every part of Christendom, and Irish teachers and professors spread throughout the known world. "The body of her laws," says one of her historians, "revised and codified, is now, by order of the British government, being translated and published as a rare and valuable treasury of ancient jurisprudence, Parliament making an annual grant for that purpose since 1852."

But alas! her glory has departed. All the solemn treaties made by England, when Ireland consented to a union, have one after another been violated; her manufactories, by direct legislation, have been ruthlessly destroyed; the education of her children made a penal offense; her lands confiscated; her troops disbanded, and hated rulers set over her—Governors, Chief Secretaries, Constabulary, Police—all appointed by the English government, with a standing army of 25,000 soldiers to enforce obedience to these officers, all of which the Irish people are taxed to support. Thus, by degrees, has England made Ireland what she is to-day, a helpless, beggared, dependency. Though too crippled in her resources to make open war, her national cry is still the same as it ever has been, and ever will be: "Give us liberty or death." Death she has had in many forms but for centuries not one taste of liberty.

The discontent of this oppressed people has been voiced from time to time, by Grattan, Curran, Emmet, Burke, O'Connell—all far-seeing statesmen and gifted orators—but what avail unanswerable arguments based on the eternal principles of justice, wit, wisdom, eloquence, when weighed in the balance with the greed, selfishness and tyranny of the English government.

And now a Tory ministry proposes to give the last turn of the screw in a Coercion Act, that, if passed during this session of Parliament, will reduce the Irish nation to hopeless slavery. This bill, depriving the people of trial by jury; of the freedom of the press and of speech; of the right to hold public meetings—in fact, making football of all their civil and political liberties, is a disgrace to the age in which we live, and should be publicly and officially denounced by every

civilized nation. Americans on this side the water are proud to learn that public meetings, with Governors of the several States in the chair, are being held in our country to protest against any further outrages on this long suffering people. While England boasts of being a Christian and civilized nation, in all her dealings with foreign countries she has proved herself the most brutal government on the face of the earth. She has ever been quick to point the slow, unwavering finger of scorn at oppressions in other lands.—let all nations now make a united effort to open her eyes to her own slavery in Ireland. She is to-day subsidizing the wealth of the world, as far as she can to support her army, navy and established church; her royal family, nobility and petty county grades of aristocracy; her system of land tenure, tithes, taxes and corrupt social customs; her increasing pauperism and crime, grinding the last farthing from her subjects everywhere to maintain a show of state at home.

In this supreme moment of the nation's political crisis the Queen and her suite are junketing round in their royal yachts on the coast of France, while proposing to celebrate her year of Jubilee by levying new taxes on her people, in the form of penny and pound contributions to build a monument to Prince Albert, who never uttered one lofty sentiment or performed one deed of heroism, if fairly represented on the page of history. The year of Jubilee! while under the eyes of the Queen her Irish subjects are being evicted from their holdings at the point of the bayonet; their cottages burned to the ground; aged and helpless men and women and newborn children, alike left crouching on the high-ways, under bridges, hayricks and hedges, crowded into poor-houses, jails and prisons, to expiate the crimes growing out of poverty on the one hand, and patriotism on the other.

While the Queen has laid up for herself and her innumerable progeny ten millions of pounds during the last fifty years, the condition of the laboring classes in Great Britain has been growing steadily worse; for what then should the gratitude of the people take an enduring form of expression in a Parian marble monument to her consort?

A far more fitting way to celebrate the year of Jubilee would be for the Queen to scatter the millions hoarded in her private vaults among her needy subjects, to mitigate, in some measure, the miseries they have endured from generation to generation; to inaugurate some grand improvement in her system of education; to extend still further the civil and political rights of her people; to suggest, perchance, an Inviolable Homestead Bill for Ireland, and to open the prison doors to her noble priests and patriots.

But instead of such worthy ambitions, in the fiftieth year of her reign, what does the Queen propose?

With her knowledge and consent, committees of ladies are formed in every county, town and village in all the colonies under her flag, to solicit these penny and pound contributions, to be placed at her disposal. Ladies go from house to house, not only to the residences of the rich, but the cottages of the poor, through all the marts of trade, the fields, the factories, begging pennies for the Queen from servants and day-laborers. One called at the door of an American lady a few days since, and asked of the maid who opened the door, to see the servants. After wheedling them out of a few pence, she asked for the mistress, hoping to obtain from her a pound at least, but she being an American and a republican declined giving a donation, on the ground that the Queen having amassed a vast fortune of ten millions of pounds, was abundantly able to erect a monument to Prince Albert herself. She thought it would be more suitable if the Queen gave a Jubilee offering to her people rather than they to her.

"But," urged the lady beggar, "it will rouse good feeling among the people to take some part in this commemoration." "Why should there be good feeling?" said the American. "For fifty years the poor of England have been taxed heavily to support Her Majesty and to make marriage settlements on all her children, and while she has been growing richer and richer they have been steadily growing poorer and poorer." The ladies who started this woman's fund intended it should all come back to the people in the form of charity. Great regret was felt by them when they learned that Her Majesty intended to erect a monument. The complaints became so loud that at the Queen's commands the ladies were informed by Mr. Ponsonby that only £1,500 would be expended in that way and the remainder would be devoted to charity. It is evident royalty is looking for a most generous outpouring by the people.

To show how little idea the people have as to the sentiment and æsthetic taste involved in this proposed work of art, one poor woman when asked to give a penny to the fund, said "here, Miss, take two, sure I've known what it is to want myself sometimes." Another needy widow said, "Oh, yes, I can spare a penny for the Queen. A widdy with a large family must have a great struggle to make the ends meet." Many such stories are repeated with peals of laughter. But who that has a soul to feel could receive money from the hard hand of poverty, and under such false pretenses. Instead of making merry over such misplaced generosity, public indignation should be roused against those who receive it.

To be sure the queen has had a long reign, but what great national work or what new liberty for her people has ever emanated from her brain? Her influence, as far as she has had any, has been against all change and improvement. If the crowned heads of Europe were

to make a present to the Queen and build two monuments, both to her and her consort, it would be highly suitable. For one of their number to stick to a throne for fifty years in this revolutionary period is indeed remarkable.

But as her name has never been connected with any progressive movement, why ask gifts from the people? Through the troubled times of the great unemployed, and the prolonged Irish struggle, the country has only heard of her in connection with one democratic demonstration. She attended a private representation of that popular Parisian circus, in London, and it was recorded in all the papers that Her Majesty was delighted with the exhibition and honored the baby elephant by caressing his left ear.

The idea of a penny from the masses is a nice point in English calculations. When they established their system of free schools they passed a cunning little by-law, requiring each child to come with a penny in its hand, oftentimes with its little stomach so empty that the brain could not work. Think of the self-control the child must have exercised in passing a bake-shop with a penny in its hand! A humane teacher told me she was obliged to take the penny, but she usually gave the children that needed it a roll of bread, which she purchased for that purpose on her way to school. To rescind this by-law and establish a bread fund for hungry children in the schools would be a good use to make of the Jubilee pennies filched from the poor, but to build a monument on such a basis is enough to make Prince Albert turn in his grave.

London, April.

CHATS WITH A CHIMPANZEE.

BY MONCURE D. CONWAY.

Part III.

"I am eager to know the ways and means of your evolutionary pilgrimage to humanity and thence to reverent monkeyhood."

So I said when next presenting myself, girt with sacred flowers, before my sage of the monkey temple at Benares. No sooner was my query put than from the blood-stained pavement outside came a vulgar English voice, crying: "In the beginning was the word, and the word was with God, and the word was God." Here there were confused voices, and the next sound was the canting reader again—"Without Him was not anything made that was made. In Him was life; and the life was the light of men; and the light shineth in darkness, and the darkness comprehended it not." (Noise.) "My dear hearers, and you, ye poor deluded idolators, this is the blessed Trinity, three persons in one God—" (Tinkle, tinkle!)

I knew well the meaning of the musical tinkle. Some procession was bearing a god or goddess on its

ceremonial round, had paused before an altar and begun the instrumentation for a sacred dance. I moved away to an aperture in the wall and saw the nautch girls just beginning to dance before a grim but gaudy god throned in his sedan beneath a cobra canopy. Near by stood a white-robed and turbaned cockney with his little cohort of Salvationists.

"In the name of Almighty God stop that idolatry and blasphemy, or the plagues of ——"

A sharp official voice reprimanding, cut short the sentence of the Salvationist, who was pale and trembling.

"Sing, sisters!" he cried.

In a moment the tinklings of the sacred triangles were drowned by a dozen shrill voices wailing of the "Sweet By-and-By." In an instant two powerful Hindus darted forward, seized the foolhardy Salvationist and rolled him in the wet blood of sacrificed kids. The English women shrieked, the Hindus yelled, and a fight began which might have ended seriously had not the police appeared and marched the Salvationists off, followed by the two Brahmans who had assailed him. When I turned back into the court of the temple I saw a hundred monkeys seated quietly along the parapet overlooking the street and gazing with silent interest on the crowd beneath. When the human companies which came into collision had departed the monkeys slowly distributed themselves, and my friendly chimpanzee descended.

"Those poor Christians and Brahmans did not understand each other," he remarked. "If they had understood each other they would have embraced instead of fighting. There was no real difference between the god in the sedan and the god in whose name the Christian forbade the other's rites. But I am puzzled that a man should in one breath utter wisdom and in another show himself a fool. When he said of his god, 'without him was not anything made that was made,' why should he be furious against these divine manufactures in India?"

"Ah, he didn't say that himself; he said it as a parrot says what it is told, without understanding it."

"He is then an illustration of the words, 'the light shineth in the darkness, the darkness comprehends it not,' for surely he uttered wise sentences."

"Well, let us leave the poor fellow now, for I am anxious to hear about your evolutionary method."

"In the beginning was the word.' That is the key of creation. There is no beginning beyond the beginning of language. In the first silent intercourse between living forms, grassblade's signal to grassblade, flower blushing to flower, and back of these to the faint infinitesimal communications which, through the *kalpas* (or *aeons*, you might say) led up to them."

"Some tell us that the dumb inorganic universe—the mineral, the worlds and stars—must have had a beginning."

"In a sense, no doubt. I hurl this round cake against that wall—thus! You observe those doves picking up the crumbs. Each crumb has just had a beginning. The sun once hurled into space a cosmical cake which has broken up into worlds. Perhaps the sun itself was a crumb of a previous cake, perhaps not. There is no absolute beginning in these changes."

"Then you would find the beginning in the appearance of life on our planet."

"In the beginning was the word,' as the pious parrot said. Without language was not anything made that was made. The living germ was not made."

"Some of our scientists say life was evolved out of matter; that the inorganic evolved the organic."

"I recognize the idea as a phase of thought through which our anthropoid race passed. In recoil from a primitive and fictitious system which assumed millions of causes for phenomena only superficially different, we went to the other extreme and confused antagonistic phenomena in a unity so unnatural that it had to be made supernatural. Why should not life be an original mode of one thing as well as lifelessness that of another? Why—except by some theological or metaphysical assumption—should we say that organic and inorganic are not equally eternal, in their several essence, and equally without beginning?"

"It has been said the phenomenal universe implies a cause, because every effect implies a cause."

"But it is an assumption that the universe is an effect. It exists. No man has ever shown that it had any beginning—neither its inorganic atoms or its organic germs. There is live stuff and lifeless stuff. The lifeless stuff runs through certain changes, chemic, molecular and other; the living stuff through certain other changes, growth, decay; the two are found combined and mutually modified in many forms. Thus it always was, so far as anybody has shown."

"And always will be?"

"That does not follow. It were mere speculation to inquire. The thing in which I suppose you to be interested is the beginning and process of creation—that is, the various development of life-stuff in this world."

"It is just that I wish to know."

"Well, I can only tell you about the particular road I have traveled. It is not necessary to suppose that all forms have traveled by one route. As it is not necessary to suppose that granite was evolved from flint, flint from water, water from salt, neither is it necessary to suppose that whales, crabs, butterflies, tigers, have been evolved from each other."

"Such variety is not admitted by Western science."

"Perhaps because an ancient deism survives in it as a suffocating unity. What reason is there to believe that our cherries were once plums, or the reverse? Amid the innumerable myriads of atoms and germs floating

through infinite space through infinite time, cohering, crumbling, combining under various chemic influences, the molecules assume varied shapes, the life-germs varied potencies; and while the inorganic world subsists in endless shapes, the seeds grow into many forms and flavors. A mouse is not evolved from the same ancestor as the adder that preys on it, any more than a diamond from an opal,—at least such is my opinion. Were it proved that mouse is evolved from adder it would be interesting, as it is to a philologist that your word ‘adder’ is evolved from our Hindu demon ‘Ahi,’ but it would not affect the principle of evolution.”

“It is, as you suggest, a detail.”

“Very well. Now we may consider the line of human evolution without being entangled in other questions. But, lest I take up your time by repeating what you already know, let me ask you whether your thought has been directed to the consideration of language as a factor of physical evolution?”

“Yes, by a great master to whom I have listened—Huxley. In one lecture, long ago, he spoke on this subject in a way which I often hoped he would follow up. He illustrated the vast change of function which may follow a minutest change of form, by showing how slight a pressure of pincers on the hand-rivet of a watch may stop it. The register of the solar system becomes and idle box of metal. The minute modification of form would make a functional change quite infinite. This he applied to the minute difference in the vocal chords between a speaking and speechless animal. And it is language, he said, that makes man what he is; language, giving him the means of recording his experience, making every generation wiser than its predecessor, more in accordance with the established order of the universe. It is speech which enables men to be men—looking before and after, and, in some dim sense, understanding the workings of the universe,—distinguishing man from the brute world. This functional difference, so infinite in its consequences, may depend on structural differences absolutely inappreciable by our present means of investigation. Were you to alter in the minutest degree the proportion of the nervous forces now active in the two nerves which supply the muscles of my glottis, I who now speak, should become suddenly dumb. The voice is produced only so long as the vocal chords are parallel; and these are parallel only so long as certain muscles contract with exact equality; and that again depends on the equality of action of the two nerves referred to. So that a change of the minutest kind in the structure of one of these nerves, or of the part in which it originates, or of the supply of food to that part, or of one of the muscles to which it is distributed, might render us all dumb. But a race of dumb men, deprived of all communication with those who could speak, would be little indeed removed from the

brutes. The moral and intellectual difference between them and ourselves would be practically infinite, though the naturalist should not be able to find even a single shadow of specific structural difference. So spake the professor.”

“So much then you know. These are pregnant testimonies from the human point of view. When we meet again I shall have something to add from the anthropoid standpoint. The hour has arrived when I must go and receive some sacrificial offerings. See, my worshipers already begin to kneel!”

I asked him whether there would be found any appreciable difference between the vocal apparatus of a fine opera singer and that of one who could not sing. He replied that a naturalist might, perhaps, detect such difference, as a violinist might detect between a Cremona and ordinary violin of the same size. I once put a similar question to Dr. Carpenter, who said that the billionth of an inch may measure the difference between the chatter of a monkey and the song of a Patti. Darwin indeed, wondered that some apes do not talk. Schleicher holds that monkeys and men are both descended from the same anthropoid race, now extinct; those that acquired language developed into humanity, those that failed to gain speech deteriorated into our present monkeys.

THE FREE RELIGIOUS ASSOCIATION AND ITS APPROACHING ANNUAL MEETING.

BY WM. J. POTTER.

The Free Religious Association has been in existence twenty years. It will hold its twentieth anniversary in Boston on the 26th and 27th of the present month. This meeting promises to be one of exceptional interest and importance. It will have a special interest, not only as bringing together a large number of able and attractive speakers, but as involving, in the discussions proposed, both the retrospective and prospective points of view. It will have a special importance as determining, perhaps, the future of the Association.

The Free Religious Association has a unique history. There had never been anything like it before in this country, there has never been anything like it in any other country. It is, perhaps, owing to this uniqueness of character, if the Association has not fulfilled all the expectations which any persons may have had with regard to it at the time of its organization. The organization was designedly made of the loosest type possible,—the farthest removed from anything of an ecclesiastical nature, though intended to affect all ecclesiastical structures. It had no set of doctrines to promulgate, it established no fixed machinery for carrying out a certain definite scheme of work. It simply had certain ideas and principles by which its organizers hoped to impress and gradually shape public opinion; and for this end, they trusted chiefly to the public meeting, the lecture

and the printing-press. They left the organization itself free to be shaped by the growth and progress of the ideas and principles which it embodied.

There are, probably, not a few readers of *THE OPEN COURT* who remember well that first public meeting in Horticultural Hall, Boston, at which the Association was formed. Those who prepared for that meeting and felt the profoundest interest in it could not themselves foresee what would be the result. At the several preliminary private conferences which had been held, of persons interested in the application of the freest thought to religious questions, there had been a difference of opinion in respect to organizing. One of these meetings, held at the house of Dr. Bartol, was a most notable gathering. It was attended by some sixty persons or more, who had been specially invited to consider the question. The discussion was able, earnest, frank, and continued the greater part of the day. Some of the special utterances of that occasion still linger in my ears word for word. With very few exceptions the meeting consisted of those who were of Unitarian affiliations or antecedents. This came to pass, because the occasion which had started the question of a new organization had been given by the action of the National Unitarian Conference, in putting into the preamble of its constitution certain theological phrases against which a minority had earnestly protested. Yet it cannot be said that the voice of this meeting was in favor of organization. It was a divided voice. Some of the ablest and most influential of those who spoke on the question were opposed to organized action. Some of the most radical members of the meeting, though deprecating the Unitarian proceedings and feeling themselves excluded from the National Conference, were averse to any other kind of organization than that of the individual society. Though the result of the meeting was the appointment of a committee to present the same question at a public meeting, to be called and arranged for by them, it can only be said that this conclusion was rather conceded tacitly as a right to those who favored organization than advocated or voted for by a very considerable number of those present. Even that committee became partially dissolved before the time of the public meeting came. It was, therefore, not at all clear what would be the issue of the public step nor whether many people would respond to the call.

In view of these facts, the committee ventured to secure a hall of only moderate size. The Boston Horticultural Hall is estimated to seat an audience of a thousand. Considerably before the hour advertised for the meeting the seats were all taken, and people were beginning to stand in the aisles; and when the committee, a little before the time, reached the hall, they were told that they could not get through the crowded mass of human beings from the front, but must get to the platform

from the rear. This packed assembly, occupying every seat and all the standing room and extending out into the vestibule, remained through the greater part of the long morning session. The public notice to which this gathering was the response was very simple. It ran as follows: "A public meeting, to consider the conditions, wants and prospects of Free Religion in America, will be held on Thursday, May 30, at 10 A. M., at Horticultural Hall, Boston." Appended to this was the announcement that R. W. Emerson, John Weiss, Robert Dale Owen, Wm. H. Furness, Lucretia Mott, Henry Blanchard, T. W. Higginson, D. A. Wasson, Isaac M. Wise, Oliver Johnson, F. E. Abbot and Max Lilienthal had been asked to address the meeting, and that addresses might "be expected from most of them." The notice was signed by "O. B. Frothingham, Wm. J. Potter, Rowland Connor, Committee."

It must be remembered that the term "Free Religion" used in this call had not then become the specific appellation which it is now. It simply had the general meaning of religion emancipated from every kind of thrall. It will be noticed, too, that the movement had already passed beyond the boundaries of denominational Unitarianism. Mr. Connor, of the Committee, was then the colleague of Dr. Miner, as junior pastor of the First Universalist Church in Boston. It may here be added that his affiliation with the Free Religious movement cost him his position in that church and denomination. Of the invited speakers, Mr. Blanchard also represented progressive Universalism; Messrs. Wise and Lilienthal were Jewish Rabbis; Lucretia Mott was the well-known and venerated preacher of the liberal division of the Society of Friends; Mr. Owen was a leading light among the Spiritualists; Oliver Johnson represented the Progressive Friends. The others, though they were or had been connected with the Unitarians, were either already doing their work independently of any denominational standing or held their denominational positions of less account than their regard for liberty of religious thought. The actual speakers and the order in which they spoke, were, O. B. Frothingham, who presided, Mr. Blanchard, Mrs. Mott, Mr. Owen, Mr. Weiss, Mr. Johnson, Mr. Abbot, Mr. Wasson, Mr. Higginson and Mr. Emerson. Mr. Emerson had sat in the body of the hall throughout the meeting, unobserved from the platform, and began his remarks by saying that he hardly felt that he had come to the right hall when he found the house so full of people; that he had expected a committee meeting rather than such an audience. He showed that he was deeply interested in the occasion, and at the afternoon session, when a constitution was adopted and organization was effected, he gave a proof of this interest in a way unusual with him. Though not commonly working with organizations nor joining their membership, he was among the first to come forward to have his name

enrolled on the list of members. In the Executive Committee appointed, following the adoption of the constitution, Unitarianism, Quakerism, Spiritualism, Universalism, Judaism, were all represented, as well as that large realm of rational thought and humanitarian activity outside of all denominational lines.

It is not my purpose here to trace the history of the Free Religious Association during the twenty years of its existence. But I wish to say this: no one can rightly comprehend that history without taking into account these circumstances of the origin of the Association to which I have referred and without noting especially the variety and diversity of elements that made its constituency. If any persons were expecting that this new religious movement would set up the machinery of an active propagandism corresponding to the activity of an ecclesiastical sect—would become, perhaps, itself a new and advanced religious sect—organizing local societies, sending out preachers and lecturers, etc., they were doomed to disappointment, though in the latter particular one or two attempts have been made. It was not to be supposed that the venerable Lucretia Mott would leave the Quaker meeting-house, where after many struggles she had won for herself rational liberty, to join a local "Free Religious" society, should one have been established in her neighborhood; nor that Rabbi Wise, who was one of the first Directors of the Association, would abandon his synagogue to become a lecturer for "Free Religion" as something distinct from the rational ideas and advancing thought which he believed to be embodied in progressive Judaism. Indeed, the constitution of the Free Religious Association expressly declared from the outset that membership there should "affect in no degree [a member's] relation to other associations." By this clause it was evidently intended to declare that the new movement was not to be necessarily a secession from existing religious bodies, or a new body competing with the old in the same general field. It was to do its work in a different way for different ends. And, again, if the Association has not done all that some of its members hoped it would do, and even now believe it might have done, in the field marked out by its own constitution, and especially in promoting certain definite ethical and philanthropic activities, the reason may again be found in the fact of its various and scattered constituency, its members being already engaged more or less in activities of this sort wherever they might be located. In fine, the nature of the organization was of too broad a type to permit, to much extent, other methods of practical work than those adapted to create and shape public opinion, and to inspire the members individually to do the utmost in their power for promoting the objects of the Association in their respective localities and spheres of labor. The work of the Association has been done, therefore, through the public convention, the lecture-platform and the printing-press.

On account of the variety of religious and philosophical beliefs appearing on its platform and to be found in its membership, it has sometimes been said that the Free Religious Association is merely a free parliament for the expression of all opinions on the subjects presented for discussion. But this is a most superficial view of the significance of the Association. It is true that all honest opinions on religious and ethical questions, all varieties of view, have been welcomed on its platform. It is also true that there is great diversity of religious belief among its members, and that the constitution expressly declares that no "test of speculative opinion or belief" shall debar from membership. Yet, through the same constitution, the members do affirm certain very important things together, which gives them a very distinct significance as a religious organization. For one thing they affirm unrestricted mental liberty as the essential condition of their fellowship, as of all true and progressive religious thinking; and then, in the statement of the objects or purposes of the Association, they affirm that all questions of religion and ethics are to be studied by the free reason, according to the methods of modern science, and not under the supervision of ecclesiastical authority; that fellowship is to be determined not by ties of sect or creed, nor even by the Christian boundary, but by humanitarian and spiritual affiliations; and that, of all the so-called interests of religion, morality, the pure character, the upright life, are of vastly more importance than any sectarian prosperity or the creed of any church. I have here somewhat paraphrased the succinct statement of objects as they have stood from the beginning in the constitution of the Association. Certain amendments of phraseology have been made from time to time, not, in my opinion, changing the original essential meaning, but only trying to express it more clearly. Whatever else the members of the Association may have had to say concerning religion, and in connection with whatever other organizations they may have found freedom and opportunity for work, in this constitution they have affirmed together these four positive propositions.

Now, these four affirmations are very momentous. Were they ever affirmed together before by any kind of religious organization on the globe? If they were to be generally acted upon they would revolutionize the religious world. But they are not to take effect by any violent action. They are sure to grow in favor, they are growing in favor; but the change is to be a gradual process,—an evolution. The evolution is already in progress in many churches and denominations, and even in the religions of the world. Every one of these great affirmations has made an important advance in the last twenty years. Various agencies have been helping toward this end; but it may be rightly claimed that the Free Religious Association, as a pioneer society in presenting and holding these ideas before the public, has

had a good share in effecting this result. Mental liberty; character before creed; fellowship in spirit rather than by the letter of a creed or by any religious name; reason, acting freely, the arbiter in religious questions rather than ecclesiastical authority,—these several ideas are all receiving greater recognition, certainly, than twenty years ago, and are beginning to permeate churches and sects with their growing power.

Of course, the great work is by no means yet accomplished. But, in the changed condition of things, the question may be raised whether the time has not come for a reconstruction of the Free Religious organization with a view to adopting more definite and concentrated methods of working for its objects. The new times may have brought new demands; opened fields for labor, perhaps, of a somewhat different kind; matured, possibly, the conditions of a larger opportunity. It is well, therefore, that the approaching twentieth anniversary meeting should take up this question, and this it is proposed to do. That meeting in 1867 was called "to consider the conditions, wants and prospects of Free Religion in America." So let the meeting that is to be held in Tremont Temple, Boston, on the 27th of May, consider the conditions, wants and prospects of emancipated religion in America at this present time. What is the duty of the present hour? What are the wants in this year of 1887? And how can the Free Religious Association meet them? Possibly an entirely new organization is demanded. If so, and this fact were made clear, the Free Religious Association, if true to its own soul, would not cumber the ground to the detriment of another organization that could now better do its work. It is not to this or that form of organization that the genuine devotee of free religion adheres. It is principles and ideas that hold his allegiance; it is the advance of principles and ideas that he craves.

ETHICS IN PUBLIC AFFAIRS.

BY M. M. TRUMBULL.

If the problem of poverty is to be solved in any rational and effective way, we must bring American politics under the dominion of ethics. Ethics must become an active governing power as well as a passive code. It must superintend the work of all our magistrates and require that every act of statesmanship shall rest upon a moral foundation. It must compel the law to apportion our civil burdens fairly, so that no part of the public taxes shall be a dead weight upon industry, pressing the laborer down to a lower plane of life. It is not enough that ethics control our private conduct, it must also direct our public acts and deeds. So long as our politicians can exclude ethics from public affairs and limit its authority to matters of personal character only, so long the statutes of the land will be made for private gain, and so long we shall compete with one another for a share in the profits of wrong.

The reckless making of public debts and their preservation for private advantage, add greatly to the oppression of industry. It is not well for labor when important private interests depend for their prosperity on the increase and preservation of public debt. It is bad for honest business when those debts are converted into capital for the rich, into usury and taxation for the poor. The pressure of public debt squeezes a portion of the useful classes from every layer of society to the tier immediately below, and when it reaches those who are just able to balance income and expenses, it crowds a portion of them into the pit of destitution. Our public debts amount to about \$2,200,000,000 and they bear interest at the average rate of about 5 per cent. per annum. This is not a very oppressive debt, we say, for a nation that earns ten thousand millions a year. True enough, but if the burden of it be inequitably adjusted it may cause much poverty in the ranks of those who have to bear it. Many of the local debts have been incurred by jobbery of little or no value to the municipalities involved. They were sown in corruption, they must be raised in incorruption, that is to say, they must be honestly paid, and that payment must come out of the proceeds of useful industry. Mr. Blaine, speaking of these debts at Oshkosh a few years ago, said: "I venture the assertion based on some scrutiny into facts that there has not been realized on the average fifty cents of palpable, permanent value for each dollar raised and expended."

The interest on those debts, to say nothing of the running cost of government, is a drain upon industry that never stops. It is perpetually calling for taxation, and crafty men have shaped the law and practice of impost and assessment in such an ingenious way that the "incidence" of them strikes most heavily upon the laboring man, the clerk, the cottage owner, the small manufacturer, and the merchant of limited means. Such facilities have rich men for undervaluing their property and concealing it, that the rate of taxation in proportion to personal wealth grows lighter and lighter as we ascend, until by the time we reach the man of ten millions it amounts to comparatively nothing. The man whose worldly wealth consists of a little cottage worth a thousand dollars cannot conceal it; he is assessed in full, while the man who owns a million dollars is generally assessed at about \$50,000, or one-twentieth of the real value of his property. This is not a guess; it is an actual estimate made from a comparison of the assessor's books, with the records of the Probate Court. In the spring the rich man lists his property to the assessor at seventy thousand dollars; he dies in the summer, and his executors then swear in the Probate Court that its value amounts to two million, five hundred thousand dollars. This is not an imaginary case. It is an actual example taken from the records, a vivid illustration of loyalty to

the law of "self-preservation" in this world, while a prudent insurance against accidents in the next world is disclosed by the reading of the will, which contains a liberal bequest to the church of which our departed brother was an honored and consistent member.

Consistent, indeed, he was. For twenty years he had "worshipped" in a costly temple exempt from taxation, a church, which not only cast the public burdens from its own shoulders on to those of honest industry, but had also entered into a partnership with all other churches to enable them to go and do likewise. In this bad "combine," the partners rise above sectarianism. On this low plane all are orthodox. Methodist, Baptist, Presbyterian, Catholic, Jew, all assist each other to evade their duty to the State. Though each believes the other's teaching false, and much of it pernicious, yet each claims tax exemption for the rest on the ground that their false teachings have a virtuous public influence. Our departed brother had only followed the example set him by his church. He had learned from its practice that ethics is not necessarily connected with religion, and that there are no public duties. Public demands may sometimes fasten upon a man, and hold him as a policeman does, but from them, as from him, it is lawful to escape if we can. He had learned that public duties belong to ethics with which religion has nothing to do, for the church is above the State. By repudiating their share of the taxes, and still more, by teaching their congregations to do so, the churches make a hundred cases of poverty, for every one that their charities relieve.

While the mere interest on those public debts presses heavily upon labor, their oblique operation also cripples industry. Those debts, in the convenient form of interest bearing bonds, offer a safe retreat where capital may revel in idleness drawing good wages for nothing. If those bonds did not provide sinecures for capital, it would be compelled to earn a living by going into partnership with labor in trade, manufactures, farming, and all the various activities which produce and distribute wealth. Those bonds unfairly compete with labor, merchandise and manufactures, in raising the interest on money. They make poverty both ways. It was the grinding power of public debts upon the poor, that caused Jefferson to declare that one generation could not of right make debts for another generation to pay; an abstract sentiment of some value as a warning, but worthless as a rule of political action, because in times of public peril the very salvation of society may depend upon money borrowed on the implied promise of a future generation to pay it. The principal and interest of these debts must be paid, but in the plan of payment there ought not to be any discrimination against the poor.

The revenues of the National Government are obtained in part by indirect taxation, and the machinery

employed in levying and collecting is an industrious maker of poverty. As indirect taxes are levied chiefly upon consumption, and especially on the consumption of what are called the necessities of life, they fall with peculiar hardship upon the poor. About a hundred and eighty million dollars a year is obtained by means of a tariff on imports, constructed in such a way as to afford protection to American industry against foreign competition. It is not the purpose of this article to encroach upon the domain of "the two great parties," by discussing the wisdom or the folly of the protective tariff, but merely to suggest that if ethics had been allowed "the privilege of the floor," when the tariff bill was before Congress, that measure would not be, as it is now, an unjust burden upon the workingman.

The actual revenue received by the government from the tariff on imports, and the incidental revenue received by the protected interests from it, are both in their levy and collection unfair to the workingman. The "incidence" of all of it strikes hardest upon him. Suppose a man with fifty dollars a month pays five dollars for sugar; the tax on this is three dollars and fifty cents, or seven per cent. of his income. It is evident that the rich man's proportion of the sugar tax is greatly less than that. Suppose that a man with five hundred dollars a month pays twenty dollars for sugar; the tax on this is fourteen dollars, or less than three per cent. of his income. Apply this principle to clothing, fuel, blankets, crockery, soap, starch, and every other article necessary in the humblest home, and we see at once how unjust and unequal is the apportionment of taxation. The duty on coal is seventy-five cents a ton. If this duty raises the price of coal to the full amount of it, or to any amount, then the share of it paid by the poor man is out of all just proportion greater than the share of it paid by the rich man. Nor does the rich man make up the difference in the purchase of luxuries which the poor man cannot buy. Where the workingmen pay twenty per cent. of their incomes in the shape of duties on the necessities of life which they must buy, the rich men do not pay five per cent. of their incomes in the shape of duties upon luxuries, which they may buy or not as they please.

In actual practice the inequality shown above is made still greater against the poor. When we come to cloth, and a hundred other things, we find a sliding scale contrivance which gives to the rich man a very great advantage. The Commissioner of Labor gives a vivid illustration of this. He shows in his recent report that on clothing goods the rate of duty on the price at the factory gradually increases as the value of the goods declines. Beginning with West of England broadcloth worth \$3.50 a yard at the factory, and traveling gradually down through thirty-six different kinds of goods to "cotton warp reversible" worth 45 cents a yard at the

factory, the tariff tax amounts to only 50.3 per cent. on the broadcloth for the rich man, while it amounts to 180.7 per cent. on the cotton warp for the poor man. Spread this inequality over hundreds of other things, and we behold a bit of machinery most ingeniously contrived for the manufacture of poverty. This is a question of ethics. It is not claimed here that a protective tariff is not necessary and just; it is only claimed that our tariff, from an ethical point of view, is open to criticism because it makes a great deal of unnecessary poverty by discriminating in favor of the rich and against the poor. It may be wise in principle, but it is unjust in practice.

Beside, rich men may evade the clothing tax entirely by purchasing their clothes in Europe, as thousands of them do. The Astor case is proof that ethics would give a healthier tone to our political system. Mr. Astor, a citizen of the United States, being about to return to his native land from Europe, provided himself with twenty-one trunks, which he filled with valuable new clothing suitable for a millionaire. When he reached New York the Custom House authorities decided that as the clothing was new, and had never been worn, it was liable to tariff duties amounting to \$2,006. Mr. Astor paid the demand under protest, and then sued the Collector to recover his money. The District Court decided that the Custom House ruling was correct, but on appeal to the Supreme Court of the United States the judgment was reversed, and it was decided that a man might bring a shipload of clothing from London to New York, without paying duty on it, provided that it was for his own personal use, and not for sale. The argument of the above anecdote is this: Any law of taxation which can be evaded by the rich, and cannot be evaded by the poor, is ethically unsound; it is unequal in its exactions, and to the full extent of the inequality it helps to create poverty.

The argument is not weakened by the answer that the workingmen themselves advocate the laws and policies that subject them to extortion and consequent privation. Their folly does not change the character of those laws nor affect their operation. It is hardly credible that workingmen themselves demand that criminals in jail shall be supported in idleness at the expense of honest labor, and yet we know that this demand is made, and that it has been established as the supreme law of New York and Illinois. It is very plain that criminals in jail must be supported by themselves or others, and if workingmen suppose that the support of convicts is a tax upon capital and not upon labor, they are seriously deceived. Every idler, in jail or out of it, is a tax upon the industry of others, and although the expense of him may seem at first to fall upon the "tax payer," it must ultimately fall upon labor, which in the end pays nearly all the taxes. The common welfare demands that every man shall be a producer of something useful to the

community, and the more he produces the more valuable he is. The contrary doctrine that there are too many producers and too much production, is a mischievous delusion, more mischievous to the workingmen who advocate it, than to any other class of our people.

It may be that ethics must first enlighten the constituencies before it can dominate our statesmen or purify our laws, but through the discipline of much poverty and tribulation we shall at last learn this lesson, that the true test of any public measure is not whether it is of advantage to me or my trade, to my order, sect, or class, but, is it right?

SEPARATION.

BY JOEL BENTON.

We walked on Alpine summits—you and I,—
 High peaks of thought magnificent and free,
 But you have found a group apart from me,
 Whose cramped horizon dwarfs the boundless sky:
 Your purity of aim is nobly high,—
 There is no acolyte, nor can ever be,
 More full of zeal, love and sincerity,
 And for your cause you let all else go by.

Friends still we are, but different ways we go,
 Each in his style to solve high spiritual laws;
 I wish you happy, and, while I am so
 And the old order makes its tender pause,
 I think how severed on alien shores we stand,
 Farther than any sea from land to land.

New York.

A SILENT INTRUDER.

(A SONNET.)

BY LEE FAIRCHILD.

With weary heart I leave the busy ways
 Of men and wander in the leafy wood—
 The dusky, timbered fields of solitude—
 Whose paths are mantled with the mingled haze
 Of sun and shade; where blend and float the lays
 Of many birds each singing as it should
 Its fragmentary song, half-understood
 By him who fain would join their artless praise—
 For God loves wordless songs. But I refrain
 From mingling with their songs the notes of creeds
 (Coinage of brains estranged from heart and love)
 Lest Nature, frowning, bid me not again
 Intrude upon her fields where Worship pleads
 Her cause in call of thrush and coo of dove!

Lewiston, Idaho.

Says the *Christian Register*:

Mr. Moncure D. Conway, in THE OPEN COURT, has published two "Chats with a Chimpanzee." Mr. Conway's method differs from that of the average reporter. Mr. Conway interviews a chimpanzee, and makes him talk like a philosopher. The average reporter interviews a philosopher, and makes him talk like a chimpanzee.

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixon Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of THE OPEN COURT is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to THE OPEN COURT should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, MAY 12, 1887.

THE PRIMITIVE STRUGGLE AND MODERN COMPETITION.

Natural selection must have played an important part in the development of man in the early periods of his existence, but happily with his departure from the point of his animal origin the struggle for existence acquired a milder form. Civilized man has emancipated himself from the conditions under which his ancestors struggled, and he has been able to substitute for the forces of the outer world, his own purposive action. He now contemplates his relations and surroundings, and by means of political and social institutions seeks to improve them. He has conceptions of equal rights and reciprocal duties and obligations, with extended sympathies; and these awaken and sustain his interest in the welfare of his race. In these social conditions in which the conduct of men is more and more governed by fixed moral principles and in which the tendency is to work together

for the general improvement, the influence of natural selection is small and continually becoming less. "With civilized nations," says Darwin, "as far as an advanced standard of morality and an increased number of fairly endowed men are concerned, natural selection apparently affects but little, though the fundamental social instincts were originally thus gained."

The influence of natural selection on man has become less in proportion as he has consciously exercised his powers for definite ends. In uniting for a common object men have been able to accomplish in a day what might not in a century and probably would never have been brought about by natural selection alone, preventing, too, incalculable suffering and loss unavoidable in a merciless "struggle for existence."

And yet the competitive principle, which has ever been the essential fact in the struggle for existence, prevails and must ever prevail in the highest intellectual and social conditions. Men now compete in useful arts and industries. Educational institutions compete in methods and efficiency of instruction. Institutions of charity compete with one another in relieving want and distress. The doctors, divided into various schools, compete in the art of overcoming disease, each school trying to prove the superiority of its own method. The churches compete in the attractions and inducements offered to increase membership, attendance, and influence, to Christianize the heathen, and to save souls from hell. Very different these and other similar forms of competition, where the manifest object is to contribute to individual and social well-being, from that heartless and cruel struggle in which those only could survive that seized every advantage of strength and position to crush and destroy their less fortunate competitors.

At the same time there are deplorable evils,—the natural outcome of competition as it exists among us to-day,—as seen in the contrasts presented by the extremes of wealth and poverty, and the strained relations between capital and labor. Great wealth gives great power; and they who possess it are very liable to employ it to their own advantage and in the interests of the class to which they belong, with but little consideration for the rights or the welfare of the poor. Intemperance, extravagance, waste, and idleness, no doubt account for much of the extreme poverty that exists, but in spite of this, it is evident as considerate and conscientious capitalists are ready to admit, there is a lack of fair and equitable distribution of the products of labor. Steam and machinery have enormously augmented the power of production; but there is a strong feeling that capital profits

too much, and that labor does not receive the advantages and benefits to which it is fairly entitled from the inventions and improvements of the age. The tendency of modern industrialism is to a division of labor and its employment by large firms and corporations, which, by owning the machinery and paying the smallest possible wages, get most of the immediate advantage of the vast productive power that invention has put into their hands.

For the evils here alluded to numerous panaceas are offered. One wants a high protective tariff, when the only consistent, however unreasonable, protective tariff would be a tariff on every foreigner who comes to America. Co-operation is another hobby with some; and it contains, without doubt, a principle that must be brought more and more into prominence, but only in co-existence with the opposite principle of competition as, for instance, in the profit-sharing enterprises established in Europe and in this country. A condition in which excellence should not be stimulated by incentives and rewarded by advantages would, were it possible, destroy all originality and enterprise. And the incentives and the advantages must be such as appeal to human nature as it is. Whether the condition of the workingmen would be improved if the government should enlarge its functions and assume new responsibilities, as the socialists propose, may fairly be questioned. The government, through the influence of wealth and the love of power and rank, is liable to become despotic, as it is in European countries where labor organizations are suppressed, and the meetings of socialists are broken up by the police, and where military power, although derived from the people, awes the people into silence. — countries from which come the class of foreigners who advocate a resort to violence to solve the problem of capital and labor,—the problem of the ages, — which American workingmen are intelligent enough to see must be solved by thought, not by explosions of dynamite. And this should be done while the country is young and the social conditions are flexible and modifiable. With age come the hedges of caste and the hard "cake of custom," which make progress impossible, and which can be broken up only by revolution.

In a country whose government derives its power from the consent of the governed, and where every citizen is a voter, the remedy for all evils that can be reached by legislation is in the hands of the people, if, indeed, they have the intelligence to see what is needed, to subordinate minor issues to a common purpose, to disregard the petty schemes of narrow-minded zealots and the professions and promises of political demagogues, and to unite on sensible and practical measures. Here, where the right to acquire

wealth, and to its undisturbed possession when acquired, is recognized by all; where the property is held largely by men who started in life poor,—intelligent men, even of the poorest classes, are not likely to confound the rights and interests of wage-earners with chimerical schemes for putting indolence on a par with industry, and rewarding wastefulness and improvidence equally with economy and forethought.

PULPIT INFLUENCE ON VITAL QUESTIONS.

That the average man who has but little time to spare from his daily avocations should be shown, in the occasional hour he can devote to such study, the right course to be pursued in relation to the vital questions of the community in which he lives, and be brought by the influence of clear thinking and eloquent tongued teachers to know the duty he owes, not only to himself but to his fellow-men, as to these questions, will be admitted, we think, by any thoughtful religious teacher. The better and wiser a citizen, neighbor, husband or father a man is, the more fitted he must surely become for any advanced state of existence that may after this life await him.

Now, the clergy,—*ministers*, as they are claimed to be, to man's highest spiritual welfare; devoted, according to popular notions, to the moral as well as to the intellectual uplifting of their fellow men,—should certainly be the leaders in teaching men their duty on the questions which to-day have a direct bearing on the welfare of the community and of the world at large. Many of these questions are enlisting the close study and thoughtful investigation of philanthropic thinkers outside the pulpit, who co-operate with the press in earnest presentation of the truest solution of these problems. But the preachers, who often get as listeners men and women too busy or too frivolous to read on these subjects, do they generally fulfill their manifest duty by dwelling in clear, convincing manner on these matters?

Pondering this query, we have looked over the list of subjects for last Sunday's sermons in Chicago churches, trying to put ourselves in the frame of mind natural to a man of business anxious to know what attitude is the wisest to take on such questions as the struggle between capital and labor, protection and free trade, temperance, organization of charities, reform in political methods, woman suffrage, acceptance of recent scientific dicta, etc., and desirous of attending that church, whatever its denomination, which promises the best help to him in the solution of these questions, on all of which, as a voter and business man, he is needs called upon to act in some way. We give our idea of what his mental comments might be as he consults the list, which we present in the order in which we read it:

"The Child Moses"—When I became a man I put away all childish things. "How to Work"—I understand that quite well now. "What to Do"—That

might help if the kind of work was indicated. 'The Apostolic Churches'—Too retrospective. 'Haman, or Hanged on His Own Gallows'—That probably has something to do with temperance, since I see Francis Murphy is to speak also, but it sounds too sensational and vindictive; I want to be shown reasonable methods. 'He Began at the Same Scripture, and Preached Unto Him Jesus'—I've been taught that. 'Go Forward'—Don't see my way clear. 'Moses' Preparation for His Work'—Moses cannot help me; he was not a man of this century. 'Individual Responsibility'—That sounds better, but vague. 'The Gradual Practical Growth of the Christian Life'—I understand that now. 'The Word of Truth—The Spirit of Truth'—Too vague. 'Remedy for the Weariness of Toil'—It's knowledge I'm in search of, not rest. 'Seed Sowing'—My wild oats are sown. 'General Judgment'—What I need is particular and careful judgment. 'Crop Bearing'—Smacks of the farm. 'Our Duty to Our Mayor and Reform'—Ah, that touches somewhat my needs! 'Liberty Enlightening the World'—Would prefer that about the Fourth of July. 'The Two Rocks'—Makes me think of Scylla and Charybdis. 'The Sacraments'—That will not enlighten me, nor will 'The Communion of the Early Church.' 'Shakespeare as an Interpreter of Religious Truths'—I wish he was living to-day and would interpret for me my duty. 'The Family of Christ'—Just now I want to know what can be done to increase the welfare of the great human family. And the sermons on 'The Magnetism of the Cross,' 'The Expediency of Christ's Departure,' 'Christian Warfare,' 'False Piety,' 'Alive Unto God,' etc., promise no better than the others. 'Ye Say it is Four Months to the Harvest, but I tell you that the Fields are Already White,' might include some helpful suggestions, but more promising is the subject of 'Great Principles and Commonplace Lives,' for it is great principles that I am in search of; but, alas! the preacher in this case, I notice, is not in the least orthodox, but a teacher of ethical culture."

And so our anxious searcher for light from the pulpit goes through the whole published list, embracing various subjects as ill suited to his needs, such as "Old Wills Dug Out," "A Smitten Shepherd" and "House-Cleaning," and it is fair to infer rises from the perusal with a feeling of discouragement that may induce him to trust to circumstances to guide his action on vital questions when presented to him; while on this particular Sunday he takes down his fishing rod and hies him to the lake, since the bait thrown out in the newspapers for him by these "fishers of men" is so unattractive. S. A. U.

In an article entitled "Trial by Newspaper," in the *North American Review* for May, the writer argues that the course followed by the press during the recent

trial of the New York aldermen, has helped to encourage a reaction of public opinion in their favor, and that the resentment of many thoughtful minds at the conduct of the press during these trials, is a sufficient indication that the newspaper may take too great liberties. The fact that there was little or no doubt as to the guilt of the accused aldermen did not justify the press in trying the case and pronouncing the prisoners guilty; that was the work of the courts, and as in them only, all the evidence was brought forward and submitted, and all the arguments for and against listened to by a disinterested jury, so to them only belonged the right of trial and decision. Innocent lives have before this been sacrificed to public opinion, and the newspaper with its disposition to try cases in its columns, may administer to the unreasoning and prejudiced feeling that so often exists in the minds of the people. The right of individual opinion cannot be questioned, and the action of judge or jury may with reasonableness be criticised, but the right to try and decide a case belongs to the courts of law alone.

The 20th anniversary of the Free Religious Association, to be held in Boston on the 26th and 27th of this month, promises to be an exceptionally interesting occasion. Under the lead of President Potter the question is to be raised whether a reorganization of the Association may not be demanded by the changed conditions of the time, to adapt it to new methods of work; and Messrs. M. D. Conway, Wm. M. Salter, A. W. Stevens, M. J. Savage and Thomas Davidson are to make addresses bearing on this theme. Another subject of discussion is the very practical one of "Sunday Observance and Sunday Laws." Capt. Robert C. Adams, of Montreal, is to open this topic, and is to be followed by Col. T. W. Higginson, Judge Putnam, Mrs. E. D. Cheney, Rabbi Lasker and others. Captain Adams is also to preside at the festival in the evening. All the meetings of the Association this year are to be held in the Tremont Temple building, and it behooves all lovers of a religion of reason and humanity to be there.

* * *

Dean Burgon, a churchman, writing in *The Fortnightly* for April, after an unsuccessful attempt to refute Canon Fremantle, whose article entitled "Theology Under its Changed Conditions," appeared in the March number, addresses himself to the reader in the old theological manner. The question of evidence is ignored, and anyone "who has been so unhappy as to have his faith shaken in the Scriptures" "in toiling through the present controversy," "and if not least of all, he has been so ill-advised as to put up with that weakest of unphilosophical imaginations, the hypothesis of evolution," he is told that unless he turns his face away, unless he stops short "in his present downward course," he will reap the terrible consequences that are reserved to

be visited upon those who reject the truth. This is one way to affect the mind. It may be paralyzed by a degrading fear; it may, through a superstitious horror of the consequences, refrain from freely searching for the truth, but there are many minds whose sense of right is not so perverted as to lead them to accept, in the place of free investigation, teaching that stands so evidently in need of confirmatory evidence.

* * *

Writing on the subject of "The Mormon Propaganda," in the *Andover Review* for April, D. L. Leonard, who is a resident of Salt Lake City, finds the striking success of the Latter-Day Saints in making proselytes, one of the most startling of religious phenomena of the age. Over half a million of people in the New World and the Old have since 1830 accepted the teaching of Joseph Smith. The missionaries have had easy work in converting vast numbers of the more ignorant classes and in persuading them to abandon home and friends and flee to "Zion." The missionaries who were sent abroad were instructed to withhold certain "truths" (those regarding plural marriage for example), and to answer all questions touching that subject with the promise that all would be explained when "Zion" was reached. At present converts are not so easily gained, as is proved by the comparatively small numbers brought in. Apostasy is frequent in the church, and the danger attending the practice of polygamy no doubt deters many from entering who would otherwise become "children of the house of Israel." The height of Mormonism has been reached and its decline has begun.

* * *

Some of the leading religious periodicals have of late contained articles suggesting remedies for the growing skepticism of the age. In the most of them the ground is taken that the unfaithfulness of professed Christians is one of the most fruitful causes of growing unbelief, and that nothing will make good the losses of the church but more earnestness infused into the lives of those who still remain within the fold. This is indeed the key of the situation, but whether more earnestness can be infused may reasonably be doubted. To those who see deeper than the surface it is evident that the "burning zeal" and "intense faith" which were once so strong have vanished forever. The belief of which they were the expression has fallen before the advance of science, and in their places are the lesser virtues of unreasoning conformity and regular church-going. It does not look as though earnestness could become an element in the lives of the great mass of Christians to-day.

An International Congress of Free-thinkers will be held in London at the Hall of Science, 142 Old street, E. C.,

on September 10, 11 and 12. The questions to be discussed are the following:

1. L'enseignement laïque.—Cet enseignement doit-il être neutre dans le sens d'indifférent aux dogmes religieux, ou doit-il être nettement hostile aux croyances religieuses?
1. Secular Education.—Ought this education to be neutral in the sense of indifference to religious dogmas, or ought it to be distinctly hostile to religious beliefs?
2. Qu'est-ce que la Libre Pensée?—Examen des doctrines philosophiques: Spiritualisme, Matérialisme, Positivisme.
2. What is Free-thought?—Examination of the philosophic doctrines: Spiritualism, Materialism, Positivism.
3. Peut-on séparer la question de Libre Pensée de la question sociale?
3. Is it possible to separate Free-thought from social questions?
4. Du rôle social de la Libre Pensée dans le passé, dans le présent et dans l'avenir.
4. The social rôle of Free-thought: past, present and future.
5. De l'influence de l'hypnotisme sur la responsabilité morale.
5. The influence of hypnotism on moral responsibility.
6. Laïcisation de la sépulture.—Crémation.
6. Secularization of funerals.—Cremation.

The editor of the *Secular Review* (W. Stewart Ross) gives to one of his lady correspondents the following sensible reply to a question asked:

We have no space here to enter into a discussion of the morals of Mary Wolstonecraft. How is it that you seem to be as hard upon her as if she were an ordinary parlor-maid or dressmaker? We will be bound to say that neither Shakspeare nor Burns nor Byron departed himself with half the humdrum decorum of the little man from whom you buy your cheese and bacon; but these men had colossal merits to set off against their foibles; and, if your little cheesemonger and chapel deacon had such foibles, he would have nothing whatever to set off against them, and his existence, instead of being a glory to his country, would be a paltry nuisance to society. Why are you not content with the soaring genius of a character like Byron, without going out of your way to gloat over his human frailties and follies?

* * *

Dr. Edmund Montgomery writes:

Hypnotism is at present uppermost in French and English scientific philosophy. The actual phenomena, which are very wonderful and interesting, will throw much light on mentality. The burning question now is, of course, thought transference,—the action of mental states in one individual on mental states of another individual without sensorial mediation. I do not for a moment believe in it. Professor Delboucuf, who is at present directing his whole attention to hypnotism, and who is a very fair judge, by no means materialistically inclined, says in his recent account of a visit to the Salpêtrière: "It is impossible to be too circumspect in judgment on hypnotic phenomena, some of the more mysterious of which,—such as the supposed action of the will across space without physical conductor,—may be explained by coincidences, auto-suggestions, complaisance in observations, or unconscious divination of what is expected." Such, in my opinion, will be the final verdict. That theory of Knowles and Gurney, of vibrations of cerebral molecules being transferred direct from one brain to another, is physically absurd.

* * *

The historical lectures recently delivered in this city by Mr. Edwin D. Mead, of Boston, and the course he is now giving on "Dante—His Religious Significance," "Dante—His Place in History and Politics," "Lessing's Nathan the Wise," "Immanuel Kant," and "Carlyle and Emerson," are spoken of in high terms of praise by those who have heard them. The audiences, not large but composed of men and women of taste and education,

have highly appreciated the intellectual treat with which Mr. Mead has favored them. We wish these lectures could be repeated in every community in the United States. Mr. Mead represents the broad culture and progressive spirit of the age.

* * *

The work entitled *Creation or Evolution*, by George Ticknor Curtis, by which, if we rightly interpret the meaning of the author, the theory of evolution was to have been shown to be untenable and false, has not succeeded in converting many, if the general tenor of criticism may be taken as evidence. It is pronounced a weak and unavailing effort, and W. D. Le Sueur, who reviews it in the May number of the *Popular Science Monthly*, declares with justice that its author attacks the arguments of Spencer and Darwin without an adequate understanding of the theories of either.

* * *

Abbie M. Gannett writes in *Unity*:

George Eliot had a religion, though, so far as we know, it was confined by its practical working to this life. With her religion was duty, "stern and unyielding duty," and her creed "Love ye one another;" she recognized the Law that abideth in all things, and paid reverent homage to it. No religion, when her life was consecration to truth? More and more we are learning that religion consists not so much in belief, as in life. If religion be the "tie that binds man to God," what constitutes that "tie?" Surely a loving devotion to the welfare of his fellow man.

* * *

The *Woman's Journal* of Boston relates the following:

A little grand-daughter of Mrs. Mary A. Livermore dislikes to be made to mind. One Sunday, after some outbreak, her father got down the Bible and showed her the text, "Children, obey your parents." She looked discontented, but went on reading the chapter, while her father went up-stairs. Presently she pursued him, Bible in hand, calling eagerly, "Papa! papa! It says some more. It says, 'Parents, provoke not your children to wrath,' and that is what you do to me every day!"

* * *

Mme. Concepcion Arenal, the distinguished Spanish reformer and authoress, writes from Madrid: "Please add my name to the list of subscribers to the Parker Fund, where are found far more illustrious names than mine, but not one in which this act of reverence is more sincere nor which respects more highly his memory. Parker died far, very far from the spot where he was born, but he does not lie in a foreign land. The country of such a man is the whole earth."

* * *

The commissioners of the Folsom State Prison of California, recognizing the adverse conditions with which discharged prisoners have to contend, are considering whether some supplemental machinery cannot be devised by which they shall be taken care of until steady work of some kind is obtained for them. They are

about to prepare a bill to be presented in the Legislature in which this important matter, that so concerns the vital interests of the people, shall be adequately explained. It is to be hoped that the commissioners of other similar institutions will follow this most commendable example.

* * *

"I thank you most heartily for the opportunity given me," writes Edvard Wavrinsky, of Stockholm, Sweden, in sending his subscription to the Parker Tomb Fund, "to express my humble admiration and to honor the memory of the noble Theodore Parker. I am at the head of a society where all are friends and admirers of his work."

* * *

The Sultan of Morocco is a practical prohibitionist. He recently closed the Moorish tobacco and snuff shops, ordered large quantities of tobacco to be burned, and had a number of Moors stripped and flogged through the streets for smoking contrary to his orders.

THE DIAL.

"*Non Numero Horas Nisi Serenas,*"

BY WALTER CRANE.

The lichen gathers where the dial stands,
 And ivy round the stone has clinging crept,
 And age has stained the carven work of hands
 That served some busy brain that long has slept;

The storms and changes of a hundred years
 Have marred and blurred the pillar's graceful lines;
 But spite of sins and sorrows, time and tears,
 Still beautiful its ancient legend shines,

Where lovers lolled and lounged in tender talk,
 Above the buried flowers rank grasses grow,
 And trailing weeds efface the gravel walk
 Where stiff brocades have rustled long ago;

Yet clear mid all this ruin and decay,
 The letters gleaming in the golden light,
 Defiant and triumphant ever say:
 "I take no heed of hours that are not bright."

And bitter rains may beat and tempests rave,
 Dark clouds withhold the sunshine from our sight,
 Night plunge the starless world as in a grave,
 The dial notes no hours that are not bright.

Oh happy dial, waiting for the sun
 Through storm and gloom in one long, tender dream;
 If dreary days might pass for every one
 Like yours, how beautiful our lives would seem.

For who the fretful frowns of fate would fear,
 Or scorn that stings or anguish that devours,
 If hearts, like Time's serene recorder here,
 Took heed of none but golden hours.

ESCHATOLOGY AND ETHICS.

BY M. C. O'BYRNE.

It was, I think, Wagner the physiologist who asserted that, while physiology contained or revealed nothing suggestive of a distinct soul, the soul-tenet or doctrine was nevertheless demanded by man's ethical relations. Expressed in plain English, this is nearly tantamount to the proposition ascribed to Voltaire, namely, that if there were no God, it would, for man's sake, be necessary to invent one. Reservation and timidity are of no nationality, and I do not forget that mankind,—the higher developed of the human race,—has become what it now is in point of the recognized ethical standard, upon and in accordance with old ideas of morality,—a fact which necessarily renders many persons apprehensive of the grave consequences which the general acceptance of materialistic theories would necessarily involve. Of course, it would be vain to deny the gravity of those consequences. If the civilized world really recognized that the acceptance of materialism was obligatory on the conscience of civilized man, then there can be no doubt that not only the basis of ethics, but the whole structure raised thereon would be in a great measure modified if not absolutely changed. The world would then have to acknowledge that no existing law or custom, no restraint on conduct, no institution, whether social or domestic, have the right to impose themselves or to be imposed on us as being originally given by transcendental or divine authority. It would have to discard, or at least to radically modify the signification of, such terms as "moral authority" and "the moral sense," so that the former should mean nothing more than habit-potency and the corroboration of social utility, the latter the change effected by heredity and circumstances upon mere animal instincts, so that "the moral sense" should be taken as signifying only empirical liking. In the pursuit of truth,—if we are to adhere to the scientific method of investigating,—it is surely a sign of weakness should we suffer ourselves to be influenced by considerations of the consequences which may follow in the wake of our discoveries. No one felt this more keenly than the late Professor W. K. Clifford, and I may add that no one has more forcibly expressed his detestation of the policy of reservation, whether prompted by timidity or by the fear of loosening the bands which have for ages bound society together. In his essay on "Right and Wrong," he said:

"Secondly, veracity to the community depends upon faith in man. * * * And yet it is constantly whispered that it would be dangerous to divulge certain truths to the masses. 'I know that the whole thing is untrue, but then it is so useful for the people; you don't know what harm you might do by shaking their faith in it.' Crooked ways are none the less crooked because they are meant to deceive great masses of people instead

of individuals. If a thing is true, let us all believe it,—rich and poor, men, women and children. If a thing is untrue, let us all disbelieve it,—rich and poor, men, women and children. Truth is a thing to be shouted from the housetops, not to be whispered over rose-water after dinner when the ladies are gone away."

Let us, however, gladly confess our gratitude to the specialists for the services they have rendered us by helping us on toward the "parting of the ways." This is, undoubtedly, a vital service, even although many of those who have brought us thither have refused to accompany us beyond that point, preferring to rest in some half-way house, actuated not perhaps so much by fear of incurring social odium as by dread of the possible consequences of disseminating opinions whose general acceptance might not only involve the subversion of every existing religion, but also the extirpation of time-sanctioned institutions and the destruction of vested interests.

I have read with interest the paper entitled, "The Basis of Ethics,"* by Mr. E. C. Hegeler. My first impression on reading the essay was that its author, like Wagner, considers some form of soul-tenet must be maintained in order to attain a basis of ethics. Impressed with this conviction, Mr. Hegeler has evolved a unique philosophy which he would use,—and indeed does use,—as the foundation of a religion which, beside its own special characteristics, embraces all that is true and good in Christianity. I think I have here correctly stated the facts as regards Mr. Hegeler's conviction that his religion is capable of promoting what we may for the present define as the moral development of man. At first sight it may appear that the terminology of animism is somewhat too freely used in the essay. The frequent repetition of such words as "the human soul," the "souls of posterity," and "immortality" is a rather unusual,—not to say surprising,—method to be observed in connection with a monistic exposition. It should be remembered, however, that the point aimed at is the basis of ethics, and since Mr. Hegeler believes that the stream of tendency has throughout the ages been good, he is perhaps desirous, by a judicious adherence to the terminology of older religions, to mitigate the harshness of the religious evolution or transition. Cicero, when instructing his son Marcus, and while expounding what is really the highest,—because the most reason-corroborated,—ethical code known, acts somewhat similarly with regard to the form of religion current among the Roman people; and Matthew Arnold rightly says: "Dissolvents of the old European system of dominant ideas and facts

* THE OPEN COURT, No. 1, page 18.

† "Animism, a term formerly employed in biology to denote the theory of which Stahl is the chief expositor; the theory of the soul (*anima*) as the vital principle, cause of the normal phenomena of life, or of the abnormal phenomena of disease. It is now current in the wider anthropological sense given to it by Dr. E. B. Tylor (*Primitive Culture*, Chapt. II-XVII), as including the general doctrine of souls and other spiritual beings." (*Vide* Ency. Brit., 9th ed.)

we must all be, all of us who have any power of working; what we have to study is, that we may not be acrid dissolvents of it." Nevertheless, while conceding this, we must be very careful not to use words equivocally, but always, as G. J. Holyoake used to say, do our utmost to keep different things distinct.

Having been invited to participate in discussing the monistic philosophy,—a discussion fittingly inaugurated by Mr. Hegeler's paper, which at the very least touches the most vital parts of the great question at issue in the open court of human reason,—I have considered it necessary to make the above preliminary remarks, mainly with the view of showing that in the pursuit of truth our individual likes and dislikes are not of paramount importance.

Mr. Hegeler's thesis may be said to lie under three heads or divisions: First, that dealing with the "human soul;" secondly, the question of immortality, and thirdly, the decision of what is good and bad for man, as affording a sound and safe basis of individual and social conduct. Incidentally also, the "God question" may have to be referred to, since we find it stated in the essay that "God and the universe are one." At the outset, then, of the discussion we have to put this simple query: Is life a dual or monistic process? So far as I can determine, the rational or commonsense,—and therefore scientific,—answer is that matter does its own work and that for us, spirit has no existence. Consequently, that which Mr. Hegeler terms the "human soul" is an office, duty, function, quality (*eigenschaft*, in the more expressive German) of organization. We may otherwise define it as a form of force, of course understanding also that we can nowhere discover force as a principle *per se*, but always as a somatic or material outcome, existing nowhere in nature except as an *eigenschaft* of masses of atoms of matter. In considering this subject we are by its very nature compelled to suppress sentiment; feeling and reason may combine in the results, but reason alone claims absolute and undivided sway in their exposition. The true philosopher speaks and writes in accordance with Newton's dictum,—*non fingo hypotheses*. Indeed, as I understand it, monism is not an hypothesis (a *supposition*), but a thesis (a *position*), and in this respect it only differs from dogma in so far as that it claims no higher authority than reason and that all reasonable human beings possess the power to verify or refute it on data common to all.

With regard to the *modus agendi* of the macrocosm (the universe) and the microcosm (man) there can be only two theories possible to us,—the theory of *vital principle* and the theory of *vital force*. On the former, the existence of two agents in the causation of phenomena is postulated,—that is, a *caput mortuum*, body or matter, animated by soul or spirit. This is animism, the basis upon which the Christian religion, its ethics and its prom-

ised immortality undeniably rest. The latter theory uncompromisingly rejects this alleged duality, and claims that matter has within itself its own inseparable vitality, so that what by transcendentalists is held to be spirit-principle is in reality merely *force*, organic or inorganic,—an innate, immanent property of matter, or body itself. This latter theory, applied both to macrocosm and microcosm, is what I understand as monism,—at any rate, it is that which my reason verifies and confirms, and in accord with which I endeavor to mold and regulate my life. So far as I can determine, Mr. Hegeler is also in this sense a monist, and one within whose mental vision the sublime picture of the poet is ever visible:

" See, through this air, this ocean and this earth
All matter quick, and bursting into birth.
Above, how high, progressive life may go!
Around, how wide! how deep extend below."

It seems to me, however, that in his anxiety to demonstrate the "human soul," the essayist indulges in much hyper-subtile, though ingenious, reasoning. It is certainly the fact that in the region of discovery we owe a great deal to the imagination. Even Newton himself was not, properly speaking, an astronomer, but an ideal physicist,—that is to say, he formulated the laws of the universe as he found them *within himself*. All mathematics are but ideal conceptions. For example, length without breadth exists only in idea,—that is, nowhere but in the mind. In reality we are all idealists, the dullest peasant no less than the poet, inasmuch as all we see is an image or idea of the thing created within ourselves by the creative organ. Mr. Hegeler, however, is not content with boundaries, and he, by the free use of the scientific imagination, builds up a theory by which the formation of concepts in the hemispherical ganglia, or gray matter of the brain, may be explained. I am free to acknowledge that the theory seems to fit the facts, and it requires no great stretch of the imagination to contemplate the cerebrum as an *ekklesia*, or deliberative assembly composed, as the essayist says, "of living, feeling organisms." It is enough for us to know that no spirit, no immaterial essence or principle, but the hemispherical ganglia of the brain constitute the real ego, without which we can have no idea, properly so-called, either of God, or the universe, or a pimple on the nose. As a matter of fact we are not called upon to explain function. Pathology has demonstrated that the cerebral nerves, the sensory ganglia and the hemispherical ganglia, are the respective sources of perception and ideation. It is, as I have said, enough for us to know this, and the ethical basis is by no means dependent on our being able to explain function. Indeed, were it otherwise, it seems that the "culture of ethics" would sorely languish unless some Semite, possessing anterior cerebral lobes which specially favored the preponderance of imagination over reason, should come to revive the cultivation. We may take it as a maxim that there is a natural solution for

everything, but true wisdom assures us that there are limits which we cannot transcend. The rose and the violet have different perfumes, various of our bodily glands form different secretions; the very external world is, with regard to man, an uncertainty, since, according to the laws of optics, everything should be perceived upside down. Eschatology, whether in the field of "natural theology" or of "natural philosophy," is a mere waste of time and energy. Excessive thought is a dyscrasia, an abnormality which can and ought to be only exercised in youth, while we are in formation. God-speculation and physical research are processes for bringing the mind into subjective and objective equipoise, the proper state of the *homme accompli* being one of equilibrium of the brain as of all other organs. "Overthought" endangers that equilibrium, and but too often prepares the way for the thinker to become the victim of the creations of his own imagination, a condition truly pitiable even when compared with that of the illiterate, well-fed, unquestioning clodpole.

From the religious or theological standpoint, the Augustinian monk (à Kempis) was right in affirming that "it is the greatest folly to neglect useful and necessary things while seeking things curious and condemned." I do not question that the *fides carbonaria*, the assured faith of a Job or an à Kempis, favors mental quietude, and perhaps permits its possessors to attain a greater degree of happiness than is possible to those who are perpetually and futilely endeavoring to solve the "riddle of the painful earth," and who are, with respect to what extends beyond man's ectoderm, the solar system,

"Shut up as in a crumbling tomb, girt round
With blackness as a solid wall."

Now, however, that the floodgates are lifted, where is the Canute who shall essay to arrest the flood? Zealous missionaries of the Incarnate One continue to point toward the "Rock of Ages," but that rock avails nothing save to those who wholly shun the impetuous torrent of research. In Mr. Hegeler's essay, however, a serious attempt is made to provide a succedaneum for the Christian doctrine of immortality. Perhaps in skillful hands the doctrine of race-perpetuation and form-evolution could be made acceptable even to those persons in whom the emotions preponderate. In all candor, however, it is evident that it will have a long and tedious struggle to wage ere it can supplant the immortality of supernaturalism. That which Mr. Hegeler terms the "human soul" is and can be nothing more than the mind in its totality of perception and ideation. If we were, for argument's sake, to concede that this mind is a congeries of living organisms,—in itself this concession is a greater eschatological feat than would be that of the confession of the truth of the Athanasian Creed*—it

would still be true that these only acquired vitality when consciousness, the manifestation of their life, began. Prior to the embryonic existence man did not exist as a sentient being, and in what we term death there is simply a reversion to the "nothingness" of unconsciousness. Reason frees us from the chimera of resurrection from the dead, but reason also furnishes us with a perfect substitute in the idea of immortality in our present bodies. Life is a slow combustion, and that which goes on after death is nothing else. According to Plato, the soul possesses knowledge derived from a prenatal state of existence, the inference being that it will continue to exist in some future state. The doctrine of *anamnesis* is the foundation of the theories which ascribe so-called innate ideas to the previous life of the race, those ancestors to whom, as Mr. Hegeler justly says, we are ourselves so much indebted. By these same theories, however, we are precluded from all other immortality than that of the race, but surely this is sufficient to form a basis of right conduct on the part of every rational, that is healthy, individual of the race. It is positively quite refreshing after reading Plato's representation of the doctrine of Socrates, to find Aristotle cutting the Gordian knot by a simple question. Solon had said, "Call no man happy while he lives, but wait to see the end." Does this, asks Aristotle, mean that a man can be happy after he is dead? "*Pantelos atopon*: altogether absurd!"

We have to face the fact that the old ethical codes, for which a divine origin and sanction have been claimed, no longer exercise supreme authority over the enlightened mind as divinely appointed standards of human conduct. I think it is Goethe who says that "the fundamental characteristic of heathenism is the living for the present." If this be true, why should we, who are heathens in the sense not of having been born outside, but of having voluntarily abandoned the Christian pale, be solicitous with respect to the future? Some years ago an English ecclesiastic, the Archbishop of York, publicly affirmed that the advanced thought of the age in which we live tended to establish a doctrine so essentially cruel and selfish that, if logically carried out in the daily lives of men and women, it would dry up the very fountains of benevolence and mutual charity. A "logical result," he said, of this teaching would be that every man would "choose to modify his notions of duty after his own

individual vitality of organic impressions. It is certainly a bold thought, even though incapable of demonstration. The passage is as follows:

"It scarcely, indeed, admits of doubt that every state of ideational consciousness, which is either *very strong* or is *habitually repeated*, leaves an organic impression on the cerebrum, in virtue of which that same state may be reproduced at any future time, in response to a suggestion fitted to excite it." Bearing in mind the mental reservation so characteristic of English *savans*, the opinion expressed by Carpenter approximates quite as nearly as we could expect to Ribot's doctrine of the habit-acquiring energy of living matter,— "the involuntary activity, fixed and unalterable, which serves as the groundwork and the instrument of the individual activity." (*Diseases of the Will*, Chap. I.)

* Since this was written, I have read a passage in Dr. Carpenter's *Principles of Mental Physiology* (4th ed., page 15) which seems to indicate that its author would, to some extent, accept Mr. Hegeler's thesis with respect to the

fashion." The theological idea of duty is an extraordinary one, its foundation being mainly one of fear. Warped from infancy, the mind of the religionist is unable to form a notion of man's responsibility to man, that is, apart from the idea of deference to God. We know how the decalogue was given:

"When God of old came down from heaven,
In power and wrath He came;
Before His feet the clouds were riven,
Half darkness and half flame."

Agreeing, as I do, with Mr. Hegeler in his opinion that the physical and moral evolution of our race have been co-etaneous and concurrent, I consider that the present standard of ethics would have come down to us had the figment of the two tables of stone never been foisted upon a visionary, imaginative and impulsive people. Accepting, as I must, the maxim that "the normal exercise of every organic function is pleasurable," I am able confidently to believe that the "sovereign good" will be found to lie in the plane of man's necessities, and that it will be found to be the direct product of the requirements of mankind. In quest of this *summum bonum* we need not waste our energies in endless analysis or in eschatological excursions beyond that nomenclature which is the *proplasm* of all things visible and invisible.

I fear this paper already exceeds legitimate bounds, so the observations I intended to have made on the question of the existence of God must be deferred. I may, however, be permitted to say that if we were to concede such an existence, it is to me absolutely certain that Pantheism would be the only logical theology.

CORRESPONDENCE.

LETTER FROM NEW YORK.

To the Editors: NEW YORK, April, 1887.

On the anniversary of the death of President Lincoln, Walt Whitman gave a lecture upon that event, together with his reminiscences of Lincoln, before a theater full of the literary people of this city. That was a noteworthy scene, when the "good, gray poet" slowly made his way, with the help of an usher, to a seat upon the stage and became the focus of attention.

The picturesque, virile old man has a noble, dome-shaped head surmounting a ruddy, large-featured face fringed with white hair and a flowing beard. The blue eyes are still clear and bright, the expression of the face frank and noble, the voice sweet and sympathetic. It is Homer without his blindness.

Whitman's recollections are told in a style both graphic and tender. Only a nature so comprehensive as this could interpret that undeveloped greatness untimely sent away before it could understand itself or be understood by others.

Among the listeners that day could be seen the chief editors, actors and authors of the city, beside such men as Lowell, Charles Eliot Norton, President Gilman of Johns Hopkins, John Burroughs, and many others.

That New York is becoming an important ethical, as well as literary, center can safely be asserted. Is it possible that the Hub is moving westward and threatens to take New York on its way toward Chicago? However that may be, more than ever before is literature the ally of ethics. The vital, upward-tending move-

ments of the age are manifesting themselves in every form. They will not down at the bidding of the dilettanti. The writer who spends his life in reporting "psychologic semitones" while great passions are seething and great blunders and stupidities wait to be corrected, will soon be restricted to a small and effeminate circle.

Such thoughts forced themselves upon me while perusing Helen Campbell's *Prisoners of Poverty*, fresh from the press of Roberts Bros. It is the condensed cry of anguish of 200,000 working women of this city, whose inarticulate moans are lost in the roar of our Christian civilization,—a civilization which is the real Juggernaut, and this the real India which stands in need of missionaries. Mrs. Campbell's book, while packed with facts enough to gorge a Gradgrind, is yet as vital as any true work can possibly be. If it only serves to enlighten women in regard to the social injustice in which they have been unwitting partakers, and sets them to making departures from old methods of dealing with women's work and wages, each in her little circle, then there will be the beginning of a new social order. They have it in their hands if only they profoundly feel their power and see how to use it,—a power invisible, pervasive and powerful. But where is the Joan of Arc who shall inspire, direct and lead on to the assault against the citadel of wrong? Individual work is the initial step; associated work will naturally follow. Either we must come to that or be driven "by whips of scorpions" in the right way.

The book, as it appeared in separate chapters in the *Sunday Tribune*, was discussed in every social circle, and Mrs. Campbell has been invited to present her experiences and views before various working societies. It remains to be seen how the orthodox will treat the subject of work and workers.

Dr. George F. Pentecost, in the *Homiletic Review*, severely arraigns the Christian church, and shows a generous scorn for that misnamed religion which huddles together a score of Protestant cathedrals, representing millions of dollars, where the rich worship God in a fashionable manner, while so near to them their fellows are perishing in squalor, filth and ignorance. He declares that seven-tenths of the resources of the church are lavished upon less than three-tenths of the people, and they the favored classes.

On the other hand I lately heard a sermon from the pastor of a Fifth avenue church which, with parsonage and accessories, cost a round million of dollars. Nearly 2,000 persons, including among them some of the most prominent editors, railroad kings and millionaires, were present. The sermon, or rather exhortation, a series of truisms unvitalized with real belief or feeling, but enunciated in sonorous English, fell like icicles upon the somnolent congregation. The reverend doctor spoke with proper haughtiness of the desire of the laborer for better conditions. "Those creatures," said he, with ineffable scorn, "these creatures are unsatisfied with a Christian civilization!" He declared that the world at large now felt the same hatred of Christ that the Jews once cherished toward Him. "They would crucify us to-day if they could. Do not make the mistake of thinking otherwise," he asserted; and no one said him nay. What shall be thought of such spiritual food, and of its acceptance by one of the foremost churches of this continent?

Another kind of teaching is going on further down town. Chickering Hall is packed with people every Sunday morning and hundreds go away for want of room. But there is work as well as faith under Mr. Adler's fostering care. The Workingman's School, conducted under the auspices of the United Relief Works of the Society for Ethical Culture, is doing noble practical work. The teachers try to make the labor of the hands help the development of the brain rather than to simply create artisans.

To this end there is modeling in clay and drawing elementary geometrical forms, first of all. Pupils then use pasteboard and

simple tools, flat wood, blocks of wood, and various systematic mechanical devices. The managers rely strongly upon the moral effect of systematic work upon the mind of the child,—a reliance which all close students of human nature will think well founded. In a late report by them one sentence strikes the key-note of the subject, "The sense of rightness, translated into terms of human conduct, becomes the sense of righteousness." Could the same number of words be made to express a truth of higher value to the educator?

Pupils construct their own apparatus in the shop, and are thus "placed in the attitude of original investigators into the phenomena of nature," the teacher serving to prevent waste of effort. Free-hand drawing is taught to all, and the child has a varied succession of lessons, so the brain and body are spared the exhaustion of long-continued application to one subject.

Girls find occupation in the cutting and fitting of garments, and in original ornamental designing for the more advanced. It occurs to me that here, if anywhere, the managers have failed to extend the scope of mechanical industry into other pursuits, as they might have done, but there is little room for anything but praise. An English lady who has been a teacher during the last ten years in the foremost English training school, and who is now taking a vacation for the purpose of examining the school systems in this country, told me, very lately, that this exceeded any she had yet seen, and her travels had extended from Quebec to St. Louis. Let us be thankful for so good a beginning and trust that many others may emulate this noble example.

HESTER M. POOLE.

THE OPEN COURT.

To the Editors:

SELBY, ONT.

The Index left but very little to be desired; and that little seems to have added itself without delay to *THE OPEN COURT*.

"What's in a name? A rose would smell as sweet by any other name." Well, there is, after all, a good deal in a name, and I cannot imagine how a better name than *THE OPEN COURT* could possibly have been selected for such a paper as *THE COURT* proves to be. The name seems quite original, and its selection characteristic of its author; and from what I know of him through years gone by I am well satisfied that this *COURT*, unlike a good many of the civil courts, will be a court of justice, impartiality, honor and dignity, and that it will be *OPEN* for evidence as long as there is any to come in.

"Devoted to the work of establishing ethics and religion upon a scientific basis." This is what *THE OPEN COURT* has set itself to do. *Hic labor, hoc opus est.* And at this critical juncture no more important field for urgent work could have been chosen. For the present is certainly a most critical period in the moral and religious history of the world. The old religions are crumbling to pieces, including the arbitrary, theological, moral sanctions; and the dissolution is so rapid that the masses have difficulty in readily recovering their moral footing. The work of reconstruction must of necessity be slower than that of demolition. Of necessity slower, because, although the philosopher can grasp the new and better principle and rapidly readjust himself to his moral environment, the peasant cannot do so with equal facility. And right here in the midst of this momentous revolution in man's moral and religious beliefs is one most deplorable and discouraging aspect of the upheaval. This is the abject theological pessimism of the times. On every hand from the theologians in the church and out of it, and even from some *quasi* philosophers who ought to know better, we hear the weak and pusillanimous cry that morality must go down along with the Christian sanctions thereof, that morality cannot stand without the Christian religion. This is a most pernicious teaching. It is in effect saying to the masses: "When the popular Christian

sanction of moral conduct is withdrawn there is nothing left to bind you to the right, you may follow your lower nature without fear of moral consequences." Now, even were it true that there is no moral sanction outside theology, the man who is a well-wisher of his fellows would try and invent a good and sufficient reason for doing right instead of closing his eyes to a perfectly valid one. But that there is a thoroughly legitimate and valid basis in science for the purest morality and the highest religion is becoming perfectly apparent to all honest, intelligent and instructed minds. Were this not so, the moral and social outlook for humanity would surely be at present dark enough, seeing that the theological basis of morality and religion is inevitably doomed. This, then, being certain, the plain duty of every man who has the new light is to do what in him lies to set his lost or fallen neighbor on his feet again on safe and solid ground. If our Christian friends really have the good of their fellows at heart they will cease prophesying and proclaiming moral ruin to the world because their creed is gone, and join us in an effort to rally and reassure our fellow-travelers. Knowing what we do, however, of human nature in its present stage we can hardly hope for this, and must be content to go on faithfully and do what we can, inspired by the hope that the light now breaking will in due time be as the noon-day sun. To hasten this rising sun toward the meridian is obviously the high motive and object of establishing such a magazine as *THE OPEN COURT*. And, as previously remarked, at this critical period in the development of man's moral and religious nature, no higher motive or more laudable object could possibly move the proprietor and editors. All hail, then, to *THE OPEN COURT*, and all honor to such philanthropists, actuated by that genuine altruism which will, we hope, in the near future more freely characterize the average man.

ALLEN PRINGLE.

THE PARKER TOMB FUND.

Correspondence between W. J. POTTER and THEO. STANTON.

To the Editors:

The following letter explains itself:

NEW BEDFORD, MASS., Feb. 9, 1887.

MR. THEODORE STANTON,

My Dear Sir: As the movement for securing money to renovate Theodore Parker's grave at Florence appears to have been started by you, I write to you to learn your views with regard to carrying out the project, and also to represent to you a feeling which has shown itself pretty strongly among Mr. Parker's nearest friends here against any interference with the original *design* of the structure. You, perhaps, noticed Miss Hannah Stevenson's letter in *The Index* last summer on this point. She lived in Mr. Parker's family for many years; was with him and Mrs. Parker when he died, and says that the arrangements of the grave were all designed in accordance with the wishes of the family, and following what they knew to be Mr. Parker's own wishes. Others of Mr. Parker's friends in Boston knew these facts, and, therefore, the subscription to the fund has been slight among them. Others, most probably, would not have subscribed if they had known these facts at the outset, and had felt that the money was to be positively used for a new kind of structure. I, for one, should not have done so. And when I subscribed I assumed, as perhaps others did, that what was to be done was not definitely settled—including the proposed bust—but would depend on the opinions the proposition would call forth, as well as on the amount of money subscribed. My own present judgment is, now that I know the feeling of these friends nearest to Mr. Parker and his family, and know Mr. Parker's own feeling, that the *design* of the grave should be preserved. Perhaps a more durable stone may be needed and renovation required from time to time; and the shrubs and flowers may need annual care to keep them abundant. Yet I would not have the grave look too artificial; let *nature* do something. Parker was a child of nature and Puritanism. It is evident that some of the visitors who think it looks "neglected" do not find it sufficiently *trimmed*. Perhaps if there should come money enough,

a bust of Parker might be placed somewhere else in Florence, with an inscription stating where he is buried, and his own request for a simple grave.

Yours truly,
W. M. J. POTTER.

As other friends of Theodore Parker and other subscribers to the Fund may have questions to ask similar to those put in Mr. Potter's letter, it has occurred to me that it might be well to give publicity to this letter and to my comments thereon, which follow:

Mr. Potter asks two closely connected questions: 1. My own views in regard to carrying out the project. 2. Whether this project will modify the original design of the grave.

In answer to the first point I may say that my own wishes would be satisfied if a good bronze bust or medallion of Parker were placed on his tomb. This is a common practice in European cemeteries, and would be a source of pleasure to those who visit the grave. But who should make this bust or medallion, if it should be made at all; how the order should be given; who should decide on its merits—all these details I have never considered, and, perhaps, it would be premature to do so at present. My friends who have subscribed to the Fund have understood that the money was to be used "to improve the condition of Theodore Parker's grave." When it shall have been thought proper to cease collecting further subscriptions, plans might be suggested as to how the Fund should be employed so as to meet with the approbation of the majority of the subscribers. This, however, is simply a suggestion of mine.

Now a word about interfering with the original design of the grave. Although I fail to discover in this original design any artistic or architectural claims for its preservation, still if the near friends of Mr. Parker cling to it on sentimental grounds, I see no reason for unnecessarily wounding their feelings by changing it. But if we should finally decide to place a bust or medallion over the grave, and if we should then find that the present design must be modified in order to conform to the artistic requirements of the new situation, I suppose that the friends of Mr. Parker will then yield gracefully, provided nothing is done to destroy the simplicity that Theodore Parker himself desired should characterize his last resting place.

To sum up, it seems to me that not until the subscription is closed and we know how much money we have, and, consequently what can be done, will it be possible to say what form the memorial should take; and when this is decided it will then, and not until then, be possible to know whether or no the original design of the tomb must be interfered with.

Paris.

THEODORE STANTON.

FREE RELIGIOUS ASSOCIATION.

The twentieth annual meeting of the F. R. A. will be held in Tremont Temple, Boston, May 26 and 27, commencing with a business session in Vestry Hall, 88 Tremont street, on Thursday, May 26, at 7.45 P.M.

The public convention, on Friday, will consider, at its first session, beginning at 10.30 A.M., the Prospects of Free Religion. An essay is expected from the President, Potter, with speeches from Messrs. Conway, Davidson, Stevens, Savage and Salter.

The convention will reopen at 3 P.M. with a speech by Captain R. C. Adams, on Sunday Amusements; Judge Putnam will next state what the Sunday Law of Massachusetts is as recently amended, and the discussion will be continued by Colonel T. W. Higginson and other speakers. Both sessions will be held in the large hall, and all interested are invited cordially.

The festival will be held as usual in the Meionaon, 88 Tremont street. Doors open at 6 P.M.; supper ready at 6.30; speaking to begin at 8; orchestral music. Captain R. C. Adams will preside and be assisted by others of our favorite speakers.

Reserved seats, \$1.00, for sale by Messrs. O. Ditson & Co., 451 Washington street, by Crandon & Co., 11 Hanover street, at the office of the Woman's Journal, and at the convention. Admission to gallery, 50 cents.

F. M. HOLLAND, Secretary.

MIND-READING.

To the Editors:

LA SALLE, ILL., May 4, 1887.

In the latest number of THE OPEN COURT, Mr. Minot J. Savage touches a very interesting subject in his article on mind-reading. He speaks of his experiments, "the story of which in any fulness would require a volume." He mentions their unaccountableness, but I wish that he had given us the most striking example of his experience; one will serve for many. I have some experience myself on this field. I experimented with the psychograph and otherwise; but must confess that there is much scope for self-deception. Faust is right when saying: *Das Wunder ist des Glaubens liebstes Kind*. Whosoever believes beforehand, will be easily convinced by what he calls facts.

The very best essay I have read on this subject of mind-reading is written by Professor Preyer in an essay *Das Gedankenlesen*. Hypnotism should not be confounded with mind-reading, but on hypnotizing, magnetizing and other psychological problems, the very same scientist has written diverse valuable articles, most of which are published in the *Deutsche Rundschau*.

I do not have at hand Preyer's essay on mind-reading, but I remember that he treated the subject with great thoroughness, and at the same time is far from attaching to it any mysticism, as may be expected of a sober observer like him.

Sincerely yours,

PAUL CARUS.

BOOK REVIEWS.

DER PHILOSOPHISCHE KRITICISMUS, und seine Bedeutung für die positive Wissenschaft. Von Prof. A. Riehl. Erster Band: Geschichte und Methode des philosophischen Kriticismus. Zweiten Bandes erster Theil: Die sinnlichen und logischen Grundlagen der Erkenntniss. Zweiter Theil: Zur Wissenschaftstheorie und Metaphysik. Leipzig: Wilhelm Engelmann, 1879-1887.

Among the works of contemporary German philosophic writers who attach themselves to Kant, Professor Riehl's *Der Philosophische Kriticismus*, is perhaps, the most important. A. Riehl (Professor of Philosophy in the University of Freiburg, in Baden) cannot be called a Kantian, since he differs from Kant in many essential points; but in certain fundamental thoughts he is at one with him. He is a representative of what THE OPEN COURT regards as the "only rational, scientific philosophy," of "Monism and Agnosticism;" and for that reason the present writer believes that the work, particularly the last part of it, will be of special interest to the readers of THE OPEN COURT. The first volume treats in admirable manner the history of the methods of philosophical criticism—considering not only Kant, but also Locke and Hume. The second volume considers in its first part the bearing of sensation upon the theory of knowledge, the origin and significance of the conceptions of time and space, perception, the principle of identity and that of sufficient reason, the relation of causality, the conceptions of substance and force and the principle of quantity. The second part, which will doubtless find a larger circle of readers than the earlier parts, analyzes the notion of philosophy and treats of the metaphysical as contrasted with the scientific method of constructing systems; and the "caricature of science and common sense, that in Hegel is called philosophy," is subjected to sharp criticism. The author cites (pp. 120-127) passages from Hegel's works which thoroughly justify his verdict

upon this sort of philosophy. As now *Hegel* has rather passed away in Germany, and is finding many followers in America, it is to be hoped that Riehl's criticism of it may be deemed worthy of mature consideration on the other side of the big ocean. The result of Riehl's criticism of metaphysics (regarded as a doctrine of the nature of things-in-themselves) is the demonstration of its impossibility, which result our author maintains in a more unequivocal way than Kant, who sought to establish metaphysics on a practical instead of a theoretical basis. Philosophy as a special science is not, according to Riehl, a view of the world (*Weltanschauung*); this is given to us as a result of all the positive sciences, which were themselves what the ancients understood under the name philosophy. But philosophy is in its theoretic part the science and criticism of knowledge, and in its practical part the doctrine of moral ideals. The author next, in a chapter on the limits and presuppositions of knowledge, combats the "complaints of the inability of man's understanding to penetrate into the essence of things," and shows that what has often been regarded as a limit of human knowledge, belongs to the nature of all knowledge,—knowledge never consisting in a doubling of things, but only in the expression of them in consciousness. To compare the worth of a thing with its representative in consciousness, its "phenomenon," is not permissible, because the unknown cannot be compared with the known.

In another chapter on the "origin and notion of experience," the author discusses empiricism and nativism and criticises the very problematical theory of "unconscious syllogisms," and explains the significance (which according to him is subordinate) of Darwin's theory of evolution for transcendental philosophy. A further chapter handles in excellent fashion the question of the reality of things and discusses the various idealistic theories, the untenability of which is demonstrated. The ensuing investigations into the relation of the psychological phenomena to material processes follow the lines of Kant and are among the profoundest parts of the whole work. Then comes a varied discussion of the vexed problem of determinism, in which the author opposes the views of Professor William James. Riehl regards determinism as an indispensable foundation for morals. The next chapter treats of the question of the Infinite, and the last chapter of necessity and design in nature.

G. V. GIZYCKI.
Berlin.

IN THE WRONG PARADISE AND OTHER STORIES. By *Andrew Lang*. New York: Harper & Brothers, 1887.

This little volume derives its title from a humorous comparison of the Greek elysium, the Moslem paradise, and the happy hunting ground of the Indians. The aim is to expose "the vanity of men and the unsubstantial character of the future homes that their fancy has fashioned," including "the ideal heavens of modern poets and novelists." "To the wrong man each of our pictured heavens would be a hell, and even to the appropriate devotee each would become a tedious purgatory." Still bolder in treatment is "The Romance of the First Radical." Why-Why, though a child of the stone age, said in his heart that theology was "bosh-bosh." The medicine-men, "who combined the functions of the modern clergy and of the medical profession," had no influence over him, after they had frightened his sick mother to death, by pretending to drive the devil out of her. He was shockingly irreverent even "on tabu-days, once a week, when the rest of the people were all silent, sedentary and miserable (from a superstitious feeling which we can no longer understand);" though some of us still keep up the old savage custom. Worst of all, he refused to marry in the orthodox way, by knocking down some stray stranger in the dark and dragging her off a captive. He actually dared to make love to a slave-girl and elope with her after she had saved him from falling a victim to a time-honored observance. Thus the first radical was the first lover. Ere long

he became the first martyr also, and died, predicting that the day would come when there will be no more slavery to medicine-men. We are drawing near to the fulfillment of Why-Why's prophecy.

THE ART AMATEUR for May has some novelties in striking designs for carved oaken chests for halls. The little sketch of "Comrades," by Ellen Welby, is very pretty, although the dog seems rather to eclipse the child, whose pleased face must be imagined from the earnest look in the dog's eyes, who seems thoroughly satisfied with her attentions. The reports from sales and exhibitions show an encouraging interest in art. Miss Wolfe's munificent gift of \$200,000, beside her collection of paintings, to the Metropolitan Museum of Art, will give a powerful impulse to this important institution. Good museums are the people's schools, where they may study and enjoy great masterpieces as well as if they were their own property. They are great conservators of art, preserving many a precious object which would go to destruction without them. The true collector takes a genuine satisfaction in placing the results of his lifetime where they will not, under any ordinary circumstances, be separated and lost. Friends of art too often forget, however, that the administration of a museum is as important as its collection, and most of our institutions suffer from the want of means to support an adequate corps of well instructed persons to take care of their pictures and statues and to reveal their worth to the public. We are glad to read that the Boston Art Museum has in part supplied this want, and has appointed Mr. Robinson its curator of classical antiquities, and Mr. Koehler of engravings. Mr. Koehler has just opened an exhibition of etchings by Rembrandt. Mr. Robinson has published a catalogue with the history and description of the sculpture in the museum. There are many other good things in this number, both in the letterpress and in the illustrations. Mr. Virgil Williams shows that artists are not wholly impractical in his significant hint that "a purchaser always likes his picture better after it is paid for." Miss Wheeler gives some hints for decorating seashore houses which are suggestive and seasonable. The instructions to young students in design painting and photography are very helpful.

WE have received the first number of *Co-operative News of America*, a somewhat long name for so small a paper, but, perhaps, its originators named it with hope that the *Co-operative News of America* would soon so largely increase that the paper could be enlarged to accord with the dignity of its title. It is to be published quarterly by the Co-operative Board of the Sociologic Society of America, information in regard to which, with explanatory pamphlets, tracts, etc., may be obtained by application to Mrs. Lita B. Sayles, Secretary, Killingly, Conn.

THE PARKER TOMB FUND.

A fund is now being raised by the friends and admirers of Theodore Parker to improve the condition of his tomb, in the Old Protestant Cemetery, Florence, Italy. The list of subscribers to date is as follows:

| | |
|---|--------------|
| Miss Frances Power Cobbe, England, | £1. |
| Rev. James Martineau, D.D., " | 1 guinea. |
| Professor F. W. Newman, " | £1. |
| Miss Anna Swanwick, " | £1. |
| Rev. Peter Dean, " | 5 shillings. |
| Mrs. Catharine M. Lyell, " | 1 guinea. |
| Miss Florence Davenport-Hill, " | £1. |
| William Shaen, Esq., " | £1. |
| Mme. Jules Favre, Directress of the State Superior Normal School, Sevres, France, | 10 francs. |
| M. Joseph Fabre, ex-Deputy, Paris, France, | 10 francs. |
| M. Paul Bert, of the Institute, " " | 10 francs. |
| Professor Albert Reville, " " | 10 francs. |
| M. Ernest Renan, of the French Academy, Paris, France, | 10 francs. |
| R. Rheinwald, publisher, Paris, France, | 10 francs. |
| Mme. Griess-Traut, " " | 3 francs. |
| Rev. Louis Leblois, Strasburg, Germany, | 5 marcs. |
| Miss Matilda Goddard, Boston, Mass., | \$25.00 |
| Mrs. R. A. Nichols, " " | 5.00 |
| Caroline C. Thayer, " " | 10.00 |

THE INFLUENCE OF THE COMBUSTION OF COAL UPON OUR ATMOSPHERE.

A PAPER READ BEFORE THE SECOND GERMAN MINING ENGINEERS' CONVENTION AT DRESDEN, SEPTEMBER 5, 1885.

BY DR. CLEMENS WINKLER,

PROFESSOR OF CHEMISTRY AT THE MINING ACADEMY AT FREIBERG, SAXONY.

Translated from the German by Dr. Paul Carus.

A hundred years ago people were still in doubt whether atmospheric air is a mechanical mixture or a chemical combination of its chief elements, oxygen and nitrogen. The fact that the two gases could be so easily separated, was in favor of its being a compound, while the extraordinary constancy of its proportional composition seemed to indicate a chemical combination. The interest taken in this problem ceased rapidly as soon as it was proven with certainty that the oxygen and nitrogen of the atmosphere exist beside each other in a free state, and that the extraordinary and never subsiding motion of the aeric ocean which is produced by the influence of the sunbeams, causes a constant and intimate mixture of its elements.

Later investigations proved that solar radiance, beside this merely mechanical influence, exercises also a chemical, or rather a chemico-physiological influence to preserve the constancy of its mixture. It was further recognized at an early date that atmospheric air always and everywhere contains some carbonic acid. But its amount seemed to be too insignificant a share to be worth any attention, yet how enormous is the absolute magnitude which this small proportion of carbonic acid in the air constitutes, considering the great expanse of the atmosphere. This was not fully understood until man's horizon extended, until his perceptive faculty grew and his intellectual eye learned to comprise worlds, until he had succeeded in determining the weight of this our earth and its atmosphere. Then the imposing transmigration of carbon taking place in the atmosphere was recognized. It was stated that all carbonic acid which enters into the air by combustion, respiration, decay and otherwise, is converted under the influence of sunlight through the vegetable kingdom into organized carbon-combinations, viz. into plants, and the liberated oxygen returns into the atmosphere. As this change takes place on a large scale, it is the chief condition of a constant composition of the atmospheric air. Thus the

carbonic acid is prepared as food for the vegetable kingdom, and the aeric ocean serves as a store-house, the stock of which by this unceasing exchange is kept at a constant level. Since our observations were recorded, which certainly is no longer than a few hundred years, the amount of carbonic acid in atmospheric air remained almost unchanged at an average proportion of 0.04 vol. perc. = 4:10000 vols. It appears to be little, but in reality it is enormous. The weight of the whole terrestrial atmosphere being 5,000 billion tons, this minute proportion represents a quantum of 3 billion tons of carbonic acid, or 800,000 million tons of carbon. This enormous quantity of carbon is suspended invisible, and scarcely perceptible in our atmospheric air, it is constantly consumed and constantly reintegrated. In consequence of this change of matter there is a state of perpetual migration.

Such is the state of things to-day. But geology tells us that there has been a period in which the atmosphere which is our store-house of carbonic acid, was more saturated. In their early era the temperature of our planet, being like that of a hothouse, produced a gigantic flora which later on in its decline formed the large coal deposits on earth. The same carbonic acid which in immemorial times roared and stormed through the high calamites of the paleozoic era, sunk as a petrified vegetable organism into a long and deathlike sleep awaiting a new resurrection in our days. It is the miner who awakens it to a new life which means a new chemical activity, and civilized mankind are busily engaged to restore it to the great circulation of nature. Thus the man of our century heats with the glow which was blazing down upon earth long before men were living on its surface, and it is this heat to which the present time owes the gigantic development by which it is characterized.

Compare conditions of to-day with those fifty years ago in countries where large industries exist, and you will be astonished at the change in such a short space of time. It is almost a superabundance of force in which humankind indulges, since we have succeeded to unlock the coal treasures underground, and make them subservient to our wants. Man indeed fully understood how to put the talent in his trust on usury. On the one hand he is not free from the reproach of profusion, yet on the other he must be credited for having lifted

himself with the help of the black bounty, to an intellectual height which never before was attained, not even in classical antiquity.

Our era is in the full sense of the word an era of combustion. Everywhere in places of industrial activity we see glowing hearths fed with fossil carbon; we meet with stationary, with movable, and with swimming chimneys which unceasingly send forth into the aeric ocean, the gaseous products of combustion, viz., carbonic acid.

The quantum of carbonic acid which human kind at present produces by combustion, for either the procreation of heat or energy, or light or electricity, is extraordinary and greatly enhanced in comparison to former times. This is done to such an extent that we may ask whether a re-introduction of carbon which has been latent for many geological periods into the circulation of the terrestrial interchange of matter, by the combustion of coal on so large a scale, may not possibly cause a change of our atmosphere so as to disturb its chemical equilibrium.

We may decidedly answer this question in the negative, but it will afford sufficient interest to look at the problem somewhat closer.

The entire production of pit coal on earth has been calculated to be per annum 360 million tons, or, on an average, one million tons per day. If we reconvert this quantum of fossil carbon into the living vegetable individuals in the shape of, for instance, our native pines, we will have a more vivid idea of its amount. 360 million tons of coal would be 942 million tons or 3588.5 million cubic feet logs. Now imagine all these pines at the fittest age for being cut, say of 80 years, their number would be, according to a calculation kindly made for this purpose by my learned friend Mr. Judeich, professor of forestry in Tharandt, 2,625 million trees, and would cover almost double the area of the kingdom of Saxony. Pine forests grown by a rational cultivation should cover the area of about four times the German empire in order to produce regularly this quantum of octogenary wood.

For a further comparison, and with regard to the mere carbon of coal, we may calculate how much human force is represented by the quantum of heat annually produced by combustion. Of course our calculation is only approximative and in some respects may not be indisputable.

One man gives off by respiration 22 liters* of carbonic acid per hour; accordingly his lungs oxidize 12 grams carbon. Now if it were possible to use carbon directly as food, viz., exclusively to feed the respiratory organs for the required production of animal heat, one man power would consume 150 kilo. carbon per year. If it were possible thus to consume coal by respiration

of human organisms, that is to say, by feeding the engine man, the annual production of coal would suffice for 2,400 million man power.

The entire population of the earth is fully one-half of this number. So we produce by machines annually, twice the amount of force which is represented by the muscle power of all humankind. In other words, the labor of man has been trippled by the use of coal. The generation of to-day works three times as much as generations of former ages, which is done by a three times greater consumption of carbon. One-third is used as food for respiration and is produced by the sun's labor of to-day; two-thirds are taken from the prehistoric store-room of the coal formation. One-third of the carbonic acid produced by combustion is exhaled through the lungs, two-thirds are emitted through chimneys of all sorts into the aeric ocean, and this same carbonic acid is used upon earth, according to the circulation of matter, for the growth of new vegetable organisms. Thus we experience another resurrection of the very same black bounty which the miner brought up to daylight, after it has afforded us heat and energy. Or should it be otherwise? Is it possible that the carbonic acid which is produced in so great quantities by modern industry, may *not* be consumed by plants, but amassed gradually in our terrestrial atmosphere? There is no reason to fear such outcome, but we must confess that we do not know. However, in pondering upon such problems, we are impressed with the truth, that nature cannot be measured by human work. Even on our little planet, which is diminutively small in comparison to the universe, proportions are too gigantic to show any traceable human influence.

The amount of carbon which is wrested from the interior of the earth by thousands of diligent hands and by other thousands is used for combustion, this whole amount of carbon is so exceedingly small as to dwindle away if compared to the gigantic stock contained in our terrestrial atmosphere. In spite of the small proportion of 0.04 vol. perc., it amounts to 800,000 million tons of carbon, and we add to this by annual combustion only 252 million tons of carbon, which is an increase of 0.0315 per cent. In addition to the 0.04 vol. perc. of the average proportion of carbonic acid in atmospheric air, the whole amount would be raised to 0.0400126 vol. perc.

The difference is so insignificant that it could not be determined by the most minute methods of investigation, especially as the homogeneity of air is great but by no means absolute.

From these and similar considerations we learn modesty when we compare human work to that of nature. Man's hand is too weak to interfere noticeably with the imposing mechanism of the cosmic gear. We work on a small scale, and too slowly to disturb the

*One gallon—three and four-fifths liters.

equilibrium of the proportions ruling on earth. Even suppose we used all pyrites which can be produced at all by mining, irrespective of pecuniary gains, and submitted them to the process of roasting and the manufacture of sulphuric acid in order to submerge all dolomites and limestones, the enormous quantity of carbonic acid which would develop, would be swept away by the wind, and soon be lost in the æric ocean.

This our smallness must not affect or oppress us! In spite of it our time is great, perhaps the greatest which humankind lived. We may indulge in comparisons like those we made, but an estimation of our works must be done according to a human measure, for after all—we are men.

THE IMMORTALITY THAT SCIENCE TEACHES.

BY LESTER F. WARD, A. M.

The concluding paragraph of the short contribution that I made to the symposium, in the *Christian Register* of April 7 last, has called forth so many interrogatories, and appears to have been so little understood, while at the same time attracting so much attention, that it has seemed to me almost a duty to expand and explain it. The paragraph is as follows:

“I would not have it inferred from the above that science is skeptical as to the immortality of the soul. Science postulates the immortality, not of the human soul alone, but of the soul of the least atom of matter. Consciousness results from the eternal activities of the universe, is their highest and grandest product, and not one atom nor one atomic movement is ever lost. The immortality of science is the eternity of matter and its motions in the production of phenomena, and science will always object to all unphilosophical attempts to confound phenomena with these.”

Probably the most satisfactory way to answer these questions and elucidate the whole subject would be to refer all who are interested to my *Dynamic Sociology*, in which this and many other important psychological problems are treated as parts of a general system of philosophy, which, in its scope at least, claims to be complete. But the argument as presented in the fifth chapter of that work could only be partially appreciated without a previous acquaintance with the series of considerations which lead up to it, as they are set forth in the two chapters that precede it; so that a suitable preparation for intelligently comprehending, not to say accepting, my point of view, would require the careful reading of at least three chapters, or nearly 200 pages of that work, while to be in condition to see the matter in precisely the same light as I see it would require the reading of the entire work, or some 1,400 pages. While I should, of course, be glad to have any who are interested in my views perform the first, or even the second of these tasks, I certainly cannot ask it, and do not expect it, and hence I will attempt in such a manner

as I shall be able within the limits of this article, to make clear the one point in question. In doing this, however, I may perhaps be permitted to quote one paragraph from the work referred to, which will state the question and indicate the answer in a clearer and more forcible manner than I could now do by the use of other words:

“The property of consciousness must therefore be assumed to inhere in every molecule of protoplasm to a certain limited degree, which in certain definitely shaped masses becomes so far increased in intensity as to be inferable from the actions of such individualized portions of the substance. From this simple state increment is added to increment throughout the whole course of organic development, until the highest manifestations are reached. Conversely, we are compelled to predicate of each component of a protoplasmic molecule some trace of the same property, which is the proper basis for the theory of a universal soul in inanimate nature. It exists, but for want of organization it is too feeble to be perceptible to the human faculties, or to work any appreciable effects. It is thus that science at length agrees with vulgar opinion as to the existence of mind in nature; but there remains this fatal difference, that instead of magnifying it into omniscience, it reduces it to practical nescience, and declares that increase in mind-force can only take place in proportion to increase in organization. And while molecular or chemical organization may so far intensify it as to render it perceptible to the human faculties, molar or morphological organization may carry it up to the exalted height to which it attains in the *élite* of mankind. The only intelligence in the universe worthy of the name is the intelligence of the organized beings which have been evolved, and the highest manifestation of the psychic power known to the occupants of this planet is that which emanates from the human brain. Thus does science invert the pantheistic pyramid.”

Now, if there is one truth that science has taught more forcibly than any other it is that we can know only phenomena, and next to this it has taught that we are ourselves phenomena. It was Kant who said, “*Der Mensch ist selbst Erscheinung*,” and this truth science has a thousand times confirmed. It applies to everything that constitutes man, his body and mind, his intellect, senses, and will.

A phenomenon, etymologically considered, is that which appears. To appear implies a time when the phenomenon did not exist as such. But, as stated in the article referred to, a beginning implies an end, appearance implies ultimate disappearance, and a phenomenon is necessarily finite in duration. Man as a phenomenon must therefore share these attributes, and as certainly as he has had a beginning so certainly must his existence as man cease and discontinue altogether.

Where, then, it may well be asked, is the room for immortality? If the whole man is but a transient phenomenon, what is it that shall endure forever?

Science answers this question of the future by pointing to the past. Taking recourse again to etymology we find that the word phenomenon, while denoting change and evanescence, connotes permanence and perpetuity. That which appears must have previously existed, else it could never appear. The phenomenon implies the *noumenon*. It is science and not theology which negatives as absurd the doctrine of the creation of anything out of nothing. Every phenomenon is a product. It is not a magic apparition. The elements that compose it existed before they assumed that form. They had always existed, and after the phenomenon shall have again disappeared they will continue to exist forever.

These elements are not altogether material. Without discussing the ultimate constitution of matter, and accepting it as a reality and the substratum of all things, we are still compelled to recognize an immaterial part as belonging to that substratum and inseparable from it, but equally independent of all considerations of time. For it is a postulate of science, and one in complete harmony with every observed fact, that the material elements of the universe possess activities by which alone they are capable of being wrought into perceptible forms. These activities are as perpetual and persistent as the material elements themselves, and as inseparable from them as the human soul is from the body. They are the atom-souls of Haeckel, and the true soul of the universe. Just as the material elements when raised to the plane of perceptibility become substance, so the immaterial elements when raised to the same plane become property, and in the two we have respectively the basis of all quantity and quality.

These transcendental elements of nature are the stuff of which all phenomena are made. They are the true noumena, or things in themselves, and they alone endure amid all the changes of time. They possess, moreover, the "promise and potency" of the highest life, the grandest thought. But they are not themselves life and thought; these are phenomena, their visible products. They have been evolved from this raw material during eons of change. They have embodied themselves in long series of increasingly higher forms that have one after another appeared and disappeared in the paleontologic history of our planet. After so long a struggle for higher and higher expression there has come forth at last, as the loftiest flight of nature, the phenomenon man, possessing a physical organ of thought, and capable in his best estate of contemplating objectively the other products of evolution and of understanding in a small degree the laws of the universe.

But now, in the exercise of these truly wonderful

powers, we find this being forgetting that he is himself a phenomenon and claiming the attributes of things in themselves. Yet, so far is he from possessing this right, that he is really, of all nature's earthly products, the most remote from the primordial cause of things. The lowest animal or plant is nearer its origin than man is; the "physical basis of life," protoplasm, is nearer than the lowest organized creature, and further progress toward the absolute source of being leads back through the organic and inorganic substances to the simplest element of chemistry, and still back to the tenuous ether of interstellar space.

So far, again, from any part of man being immortal, he shows the vast distance that separates him from that ultimate source by the brevity of his existence as compared with the enduring, but by no means eternal, rocks on which by myriad inscriptions he has sought to perpetuate his memory.

But let it not be supposed that this extremely derivative and comparatively evanescent character of man in any way implies a corresponding lack of importance. On the contrary he stands at the head of a long series of progressive steps in the mechanical organization of the primal force of nature, in each of which steps this force has been made more effective. Organization consists in the concentration and focalization of the elements of nature to render them effective in the production of results. It is the machinery, or economic gearing up of the universe, and the results are as much greater than those of unorganized nature, as the achievements of the age of machinery are greater than those of the ages before machinery had been introduced. Consciousness, reason, intelligence, and inventive genius represent the maximum of mechanical organization in the world. Civilization is their result, and in place of primeval forests we have enlightened populations; in place of wild beasts we have statesmen and philosophers working out the problems of life, mind, and society. Yet all the powers of this exalted being, man, are but the original forces of nature intensified many thousand fold through organization. The unorganized activities of the universe are feeble and ineffective for any conscious purpose. Their energy is scattered and diffused, and wastes itself in aimless and profitless work. Just as in war, in government, and in industrial economy, it is organization that achieves success, so has it been with the elements and forces of primordial nature, and what science denotes by the terms organic progress and biologic evolution is simply the progressively higher organization of these elements and forces, from the bathybian ooze of the sea-bottom to the developed brain of a Napoleon or a Newton.

But all this implies no increase in the amount of either the matter or the motion of the universe. Just as the rays of the winter sun may, by the sun-glass, be

intensified to the point of burning, just as the unnoticed electricity of the atmosphere may, by the Ruhmkorf coil or the Leyden jar, be converted into a thunderbolt, so the diffused and imperceptible "mind in nature" may by similar concentrated direction be made to display the attributes of consciousness, reason, and intelligent thought.

It is something to have learned that there exist, have always existed, and will ever continue to exist, the indestructible and unchangeable elements and powers out of which, through similar processes, equal, and perhaps far superior, results may be accomplished. This is the immortality that science teaches, the faith that inspires the genuine student of nature, and this pure and ennobling sense of truth he would scorn to barter for the selfish and illusory hope of an eternity of personal existence.

MYTHOLOGIC RELIGIONS.

BY CHARLES D. B. MILLS.

Keary, in his *Dawn of History*, speaks of the two tendencies always to be marked in religious thought, since the beginning of history, viz., "the metaphysical and the mythological tendency," as he calls them. In one the mind endeavors, in its conception of the highest, and of the world we call spiritual, to rise beyond the realm of the determinate, or of form and personal, and contemplate superpersonal and ideal. In the other it is always casting the Supreme One in the mold of form, framing its thought of him or it as individual, palpable deity, a veritable and visible, though may be distant, person. He is a royal monarch, seated on a gorgeous throne, reigning in regal pomp and splendor, surrounded by his throngs of courtiers and constant prostrate worshipers, attended by ministrant armies, passive instruments of his sovereign will, and swift to execute it on the instant anywhere throughout his vast domain. His world, the unseen kingdom of his rule, is a world of personalities, rank on rank of spirits flown from earth or distant star, and of angels, archangels, etc., in innumerable hosts filling the immeasurable realm of this potentate. Indeed there is no end to the mythology built up from this germ, the heaven and the hell, and the myriad denizens of these shadowy worlds. "Long," says Mr. Conway, "before charts of land or sea were made, the invisible heavens and hells were mapped and reported in detail." And these invisible realms were peopled with personalities, more densely, if possible, than any most thickly populated portion of the earth we know, as also more formidable and dreaded beings than earth possesses.

Men have always supposed themselves to have much more accurate knowledge of the world they have not seen, than of that they do see, a more definite and sure

communication made to them of the life beyond, than of the life here and now. And in regard to the latter it must be owned that the ignorance has always been dense and profound—this largely for the reason that the world of the present has been disparaged, postponed and ignored from the side of religion.

The sway of mythology has been complete. We all see it plainly in the religions of the rude races. The disposition to personify or impersonate and to worship the impersonation, is universal and invincible. Stones, trees, bits of bone, winds, clouds, waters, etc., etc., have been made objects of adoration, prayer and sacrifice. The natives of middle Africa regarded Lander's watch as alive. The Egyptians, as Herodotus testifies, described fire as a living being. A respectable Bushman once told his white friend that he had seen the personal wind at Haar-fontein. He tried to hit it with a stone, but it escaped from him into a hill. "In the time of Tacitus it was said that in the far north of Scandinavia men might see the very forms of the gods, and the rays streaming from their heads."* With the disposition to anthropomorphism so universal, and the passion for personification withal so prevailing, the casting of the highest in the mold of person, and peopling all the worlds with deities, human not only but animal, vegetable, mineral also, has been easy not only, but inevitable.

In the growth of civilization the mind has passed in a degree from the stage of *mythology* to that of *science*. Where the savage saw person and act of volitive personal power in rock, star or wave, the instructed mind sees force; where he saw miracle, it sees law; where he bowed and trembled with terror, it beholds and rejoices with knowledge and repose in trust. The whole course and effect of culture has been to exorcise the spirits that have been held to fill the worlds visible and invisible, and especially and most persistently the latter, and lead the intelligence to recognize the one central unity, transcendent, impersonal, supremely sovereign yet benign, sometimes named the Infinite One, but a reality so ethereal and removed from human comprehension, that for it thought hath no conception and language no name.

The exorcism among ourselves has gone forward to a very considerable extent, earth and the heavens have been freed from the sway of the mythic conceits of recent centuries even, and province after province once held under that sway, has been rescued and annexed to the realm of science, seen, recognized to be the abode of what we call natural law. Still although we have cast out in good degree the mythologic persons that once to the imagination haunted and filled the worlds, the belief yet adheres, even among the most enlightened, to the idea of one supreme and central *person*, an individualized deity, dwelling somewhere in the realms of

*Tylor, *Primitive Culture*.

being in especial manifestations of his presence and regal power. More than the shadow do we have here of the old mythological concept; we have largely the perpetuation and survival. It is reduced, indeed, to its narrowest, most ultimate form, but is veritably present all the same. To no doctrine in its faith, probably, does the mind of Christendom cling with such tenacity at this hour as that of its personal deity.

And around that idea a wider mythology will inevitably spring up, such as has been mentioned, as spontaneously as the numerous shoots and suckers from the seeds and roots of a forest tree. The mind of to-day seems largely unable to escape from its anthropomorphism, and so is held perpetually in the mythologic tether. One sees it constantly in the sermons and the prayers, hears it without end in the representations that are made wherewith to operate on souls in "revivals." I was struck lately, waiting for a train at a station out in the country, in noting the interpretations hung up on the wall of the room by the Adventists, of certain enigmatic symbols in Daniel and the apocalypse, and the exposition they give of God's dealings with man, and the sure destiny that waits the soul. The intense and all-subordinating realism, and swift running to mythology in treating such themes of religious life, which appears in all the faiths of Christendom, is seen there written in characters only slightly enlarged. And much of it draws good warrant from the sacred books in which those faiths plant. The liturgical service of the Episcopal church is charged with survivals even from a long past and mainly outgrown age. There we see the demons, ubiquitous and semi-omnipotent all around us perpetually, from which we are to pray "the good Lord to deliver us."

But it is to be apprehended that the process which has already disintegrated and pulverized so much of the crude beliefs and dark terrifying superstitions of the past, will still go on and will abolish the last relic of mythology that remains among us. There are those who have laid aside from their thought the concept of person, as applied to the invisible and eternal. To them the supreme transcends all that is determinate, limitary or personal; they cannot admit to their thought aught that is contradictory to the nature of the Infinite One. They see his presence in law, hear his voice in reason, behold his face and the very soul of his being and the splendors of his majesty, in excellence and the beaming light of truth. Here is shrine at which the spirit may bow and adore and offer its sacrifice without taint or trace of aught unworthy in its worship; here temple that idolator's footstep cannot enter. It is a religion that enlarges, exalts and feeds continually with the divine ambrosia. And the more knowledge, more perception, the more faith.

Such ones are never curious or impatient to probe

and to penetrate the form and circumstance, the *modus* of the life beyond. Sufficient unto the future the problems, the work of the future; time will solve all. They recognize the metes and bounds set in the very nature of things to the extension of personality, the veil of mystery that inevitably falls down upon all determinate that we know. The living world, the over-arching universe, with their infinitude of phenomena and shining laws; the incarnations of the divine in the human—a beauty and a mystery perpetually—making all the life hallowed, divine; the study, the improvement and deliverance of man, are themes and tasks enough for them. In their worship they advance from the child stage to the manhood stage. The mind ripening leans ever less upon person, more upon principle. The language of picture, of impersonation, speech will doubtless continue to use, but all will be transparent, and, so far from hampering, will be rather refreshing and enlarging to the freed and perceiving mind. It will carry as little any hint of the personal concept as now does the *prosopopœia* of the poet, or the beautiful impersonation by Tyndall, where he celebrates the all-procreative power and the fatherhood of the sun. We are already emancipated from any possibility of such trammel or enmeshing in our use of such words as nature, the "universal mother," and the like, but to this hour the terms God, the spiritual world, etc., awaken invariably either directly or by implication the concept of person. Why will these words not become also transparent and exalted as the others? The growth of man's intelligence in the early days carried to the recognition of the neuter gender, the use of neuter nouns, all having been originally and for long ages either masculine or feminine, no thought arising within that any of the natural objects could be without the attribute both of person and sex. It seems a very simple perception to us, but this also was an event in the history of humanity.

The mind will use the language of impersonation for picturesqueness, for clothing its thought in beauty, and, perhaps, for help to definition of the unbounded to its idea, but it will be entangled in no mesh of anthropomorphism or mythology. It will have clear undimmed perception of the transcendent reality behind, within and beyond all, that sublime substance, the One, before whom thought is important and language dumb. "The religion of the present," says Huxley, "has renounced not only idols of wood and idols of stone, but begins to see the necessity of breaking in pieces the idols built up of book and traditions and fine spun ecclesiastical cobwebs; and of cherishing the noblest and most human of man's emotions, by worship 'for the most part of the silent sort' at the altar of the Unknown and Unknowable."

But there will be, I think, celebration. The tongue

must stammer if it cannot speak. The spirit will never cease to be thrilled with sense of the mystery, will exult with delight in presence of the beneficent, all-enfolding laws. It will burst into song and praise, will invoke and celebrate the Infinite Beauty and Wisdom and Excellence. The soul will pillow itself in all passages of life as also of death upon the bosom of the boundless power and goodness. It will repose on the *moral*, know itself safe and invincible therein, now, forever. The spendors of the eternal Justice and Excellence can allure and satisfy it without end.

"Heaven kindly gave our blood a moral flow."

"For other things," says Emerson, "I make poetry of them, but the moral sentiment makes poetry of me." The whole universe speaks to the thought as being charged to the brim with moral energies, and for this it is that nature wears the bloom of sempiternal youth.

Mr. Tylor speaks of that "tendency to clothe every thought in concrete shape, which has in all ages been the main-spring of mythology." Max Müller says: "I do not hesitate to call the whole history of philosophy, from Thales down to Hegel, an uninterrupted battle against mythology, a constant protest of thought against language." It holds the same in religion. This conflict is the irrepressible one reaching through the immemorial ages of history. It was never more stern and internecine than in the present, never so profound, all-inclusive and vital as now. The issue, though still distant, was never so clear and unmistakable as at this hour.

Once the faith, the religion of humanity is inaugurated, it will work a revolution in the world's condition; mark a step in man's growth and deliverance far beyond aught seen in any age, we might almost without exaggeration say, in all the ages of the past. Religion will be changed both in its concept and its expression, the forms of its worship, in all its administration, more profoundly and completely than by any influence that has reached it since the beginning of history. All the other ameliorations and reforms have been preparatory, dispensations of the Baptist in the wilderness, making open and ready the way to this the final enfranchisement. Religion, become one with the simple plain worship of truth and beauty, all its observances and forms must be correspondingly natural, spontaneous, beautiful. The office of the priest, as we know the priesthood, will have become obsolete, superseded by the growth that brings the new age.

It will be both more *ideal* and more *practical*, reaching farthest in its thought, and coming home nearest in its action. Language, exalted, transparent, free as it must all be, will be felt lame, inadequate to hint even the transcendent conception, the communion, the thrill and the ecstatic joy the soul shall know. Yet the expression shall be in words that glow, pictures that

speak, images that soar, that lift, purge and inspire. The age of dream, illusion, mythic mirage will have passed, age of vision, of inner beholding, and great strength in truth, in God, will have come.

CHRISTIANITY AND THE MORAL LAW.

BY CLARA LANZA.

No attentive and thoughtful observer can have failed of late years to note how swift and remarkable a change has occurred in the heretofore most cherished opinions of many of us,—a divergence from the worn and down-trodden paths of religious belief, which following the law of evolution is destined to spread outward into yet larger and more important channels. I refer to the growth of a religion, based not upon dogma or superstition, but upon ethics that comprise the highest ideals of human conduct independently of aught save individual responsibility.

That a religion of this kind contains advantages more special and lofty than those set forth by the Christian doctrine, calls for little argument when we perceive that it is by degrees replacing so-called "revealed" religion in the minds of the thinking people of to-day.

It has been stated somewhere by an eminent theologian that the world in every era of its civilization has contained about an equal amount of intelligence. The quantity of this intelligence we will not stop to discuss, but serious doubts may justly rise as to its quality. In the same connection we cannot deny that the fundamental principles of morality have their roots firmly planted in ages as remote as the existence of man himself. But it is certain that the comprehension and application of these principles have greatly varied at different periods, and that they have little by little put forth new branches and flowers like the leaves and blossoms of a plant. Each successive generation, indeed, has seen the mind of man forever bent upon inquiry and struggling to emerge from darkness into light, lean in a given direction toward some particular point where elucidation is to be expected: The desired benefit was not always forthcoming, but each step has been a step forward in the sense that every honest failure is an indication of progress. It is not possible to enter into a discussion of these differentiations here, and even were it to be done, the result would not be of superlative value *per se*. Let it suffice to confine ourselves to the past five and twenty years during which, in the United States especially, the tendency toward freedom in religious belief, the casting away of threadbare tenets, the deft uprising from the trammels of theology into the broad light of self-culture and self-dependence, have been too marked to escape universal attention. Action has finally and properly come to be regarded from a more elevated standpoint than mere belief or mere sectarianism. We no longer found our estimates of human character upon

the faith of the individual, but upon his behavior. It is now a matter of indifference as to what peculiar sect a man may belong to or whether he be attached to any whatever; we concern ourselves solely with his motives and sentiments as expressed through his conduct. And if it be asserted by the few remaining adherents to old-timed orthodoxy, that the moral law be insufficient to sustain the weakness of human nature, and that something more, partaking of a divine element, be needed to form a substantial background for the development of right feeling and conduct, we must reply that the proof of this is nowhere visible, while on the other hand the partisans of Christianity find their faith in numerous instances powerless to give assistance in the serious affairs of life. The reason is not far to seek.

Let us glance for a moment at the facts as they exist and as they can be observed by anyone who takes the trouble to look at them. Given conscience as a guide and the inexorable law of duty ever before us, we are as it were, in the continual presence of a master whose commands are inevitably followed by reward or punishment,—not necessarily material in either case,—but always in accordance with the action performed or left undone. The theory of an existing hereafter where rewards and punishments will be meted out in proportion to our deserts, is superfluous so far as the rigid votaries of right living are concerned. This is self-evident. The ethics of Christianity are in themselves lofty in conception and in their altruistic significance, but the figure of Jesus of Nazareth, inseparably connected with them, takes away much of their force by its remoteness and spirituality. In the desperate struggle with existence, in moments of sorrow, and in the harsh and oft repeated conflict of opposed duties, this pale ethereal essence standing afar and crowned with a supernatural glory, can neither appeal to nor satisfy the human heart. If support or sympathy have ever been derived from this source, they spring from Christ the man and not from Christ the God, who must forever remain incapable of human assimilation. Yet, if this divine element be taken away, the most trustworthy support of the Christian faith vanishes at once.

The moral law, innate, unalterable, sustaining in its consolations, swift in censure or approbation, unfailling in its dictates, rests upon a higher plane,—that of human reason and self-dependence. It looks within for all that is best and finds its divinity in the soul of man himself. Here we have food for all our requirements summed up in two words,—duty and responsibility. It is absurd to say that any man can escape from these with impunity, since once beyond their reach, and all is chaos and desolation until a reconciliation be effected. We know that in spite of every misery we may be called upon to endure, our duties are still with us and offer us relief, and that there is no burden whose weight is

not decreased by a judicious exercise of self-sacrifice.

Too much stress cannot be placed upon the freedom of the ethical religion from every emotional characteristic, and it is this absence of all passion, sentimentality and sensuousness that constitutes its chief claim to superiority.

The self-existing force which Mr. Spencer, in his *Synthetic Philosophy*, defines as the unknowable reality and which is undoubtedly in the estimation of many thinkers a perfectly satisfactory explanation and understanding of the fountain-head of the universe, tends eternally toward a harmonious development and adjustment in human life and conduct. True progress in its every branch is dependent upon law; the moment this truth is ignored comes stagnation, which means ultimate retrogression. The leaning of ethics is toward everlasting advancement. The morality of to-day is better than that of yesterday. As individuals and as masses we occupy a more exalted position morally than we did a hundred or even fifty years ago. We have seen during our lifetime the curse of slavery abolished; the status of women has been raised; the rights of children play an important part in our Constitution; our minds are more tolerant and our vision is not obscured by narrowness of judgment.

We must be cognizant of the fact that the increase of religious liberty in the United States has been productive of untold advantages. From one end of the country to the other we have seen the æsthetic forms of worship, which are as pernicious in their falsely directed influence as is the limited conservatism they often represent, give way to a grander and nobler cult,—the striving for individual perfection, which is the more estimable since it looks for nothing beyond such results as are entirely personal, and is well content to reap its dearest compensation from the knowledge that right is practiced and adhered to for right's sake, and wrong shunned because it is evil.

We may call attention, in conclusion, to the gradual influx of Eastern creeds and philosophies into modern American thought, and which, barring their mystic phases, are in many ways worthy of study and adaptation. Nearly all of these ancient faiths are pervaded by a profound spirituality whose workings are certainly mysterious; but we, in our matter-of-fact enterprising nature, are hardly the people to be drawn into anything of this kind. The wheat is here to be separated from the chaff, and occultism, being everywhere confined rather to temperament than belief, has little chance for development in America, where the tendency is in a precisely opposite direction. Our inclination is plainly to be observed in the strenuous attempts we are making to establish a religion that shall stand firmly upon the eternal basis of the moral law, and be tempered with the widest and most liberal culture. Of course much

remains to be done and more yet to be learned, and we frequently toil painfully to reach a certain point, only in the end to slip back, perhaps imperceptibly, into the old grooves. Still the ethical religion desires nothing greater than the individual from which to gain its highest inspirations. It cannot refer to a vague divinity that rises spectral-like in the distance, and say, "Therein rests my hope of everlasting life." Nor does it regard this restriction in any way as a misfortune; for, secure in the belief of absolute responsibility, utter self-dependence and unswerving obligation, it places its ideals upon the mountain peaks of thought, and is satisfied only when these are finally attained after fierce and laborious struggles.

Few minds at any age of the world have been able to divest themselves all at once of educational control, or prove themselves superior to circumstances or surroundings. Unfortunately, we are so constituted that, even where the greatest intellectual liberty is obtained, ideas and beliefs previously acquired still cheat our independence. Therefore superstition, though we would shake it off forever, lingers in the hearts of many of us, and, loth to depart, gazes sadly into the dim vista of the past, even while the new religion points upward and onward into the grandest regions of human endeavor.

Upon the sublime utterances of Jesus of Nazareth no disparagement is ever to be cast. They are worthy of all reverence, but always the divine shadow hovers about them; we see the precepts obscured by the God who, in His turn, shrinks at last from perception and comprehension. Yet the moral law remains, and urgently incites us to action. We keenly feel its presence, and know that here, at least, there is no danger of searching for truth and finding a *fata morgana*. To this also shall be added the lesson of human experience and the fruits of human genius.

It must not be supposed that we argue from the standpoint of scientific materialism, or that we would seek to eliminate the sublime element from human nature. It is the latter, in fact, that enables us to gaze unflinchingly before us, conscious of an ever-present, all-enduring power which we ourselves are permitted to reflect. This is the true meaning of divinity, and in this sense only was the Nazarene divine.

If we live this life truly and honestly, we have no reason to regard the future unwillingly. We do not hope with the uncertainty of the Agnostic, nor like the Christian do we see the marble and iron of past and present fade into rosy and golden-tinged visions. But with the knowledge of having acted well our part, we may calmly see night close around us, and, folding our weary hands, trust blindly.

NATURAL RELIGION.

BY REV. JOHN W. CHADWICK.

Among Darwin's earlier converts there was a distinguished author and divine who announced that he

had gradually learned to see that it is just as noble a conception of the Deity that he created a few original forms capable of self-development into other forms as that a fresh act of creation has been required for every new species. But the popular heart has still preferred the fresh acts of creation to original germs capable of self-development; and wisely so, for intellectually there is no choice between the two conceptions. They are equally childish and absurd. An original act of creation is as inconceivable as the creation of any new species. And if it satisfied the logical understanding that there is a God or was one "at last accounts," such distant hearsay cannot satisfy the cravings of the religious soul for a present, active, living God. The understanding may be satisfied by the conception of an outside Divinity who gave the world a start billions of years ago, since which it has gone alone, but all religious souls, if they must choose between this conception and the conception of continual interference will be sure to choose the latter.

It has been a favorite device with scientific men to throw a cake to Cerberus, to popular superstition, stamped with this notion of an original act of creation. Sometimes, no doubt, the notion has been vital to themselves, but the device, however actuated, has always been unfortunate. It has postponed a little an inevitable day whose brightness will declare that we are not compelled to choose between the doctrines of continual interference and an original act of creation since which the world has gone alone; that a third way is open for all honest and courageous souls, a way which blossoms all along with the old sense of present Deity and again makes natural religion possible for those who walk therein.

That which I mean by natural religion—the continual and spontaneous association of all natural order and beauty with a superhuman power—had certainly been steadily decaying throughout Christendom for many centuries down to the threshold of our own. A pastoral people conceiving God in the terms of their own daily occupation said of him: "The Lord is my Shepherd: I shall not want." Again and again this gracious metaphor occurred to them: "We are the people of his pasture, and the sheep of his hand." "He shall feed his flock like a shepherd; he shall gather the lambs in his arm and carry them in his bosom, and shall gently lead the nursing ewes." But in course of time these pleasant forms of speech had to make way for others born of the city and its various activities, born of the market and the court, the stadium and the arena. The speech which Jesus used was such as only a country boy could use; it was full of charming pictures of the farm-life and home-life of the hill country of Judea. But when Christianity made its first conquests the cities everywhere accepted the new faith before the villages, and straightway this faith began to express itself in the

terms of city-life, Paul himself setting the bad example which Christian theologians have followed almost universally, until now only the poets and poetic men reverting here and there to the simpler and more ancient forms of speech.

Here is one reason for the decline of natural religion. The theologians have been men who have lived apart from nature, immersed in cities or in books, or miserably self-involved, like Calvin, who for years lived in the awful presence of Mont Blanc and never took one gleam of its immortal beauty into his mind or heart. But many other causes have contributed to the same result. The conception of law was almost entirely foreign to the Hebrew mind save in the sense of arbitrary regulation. Science was not a Semitic, but an Aryan birth, and when Christianity became Aryan the Greek and Roman sense of law began to trench upon the Hebrew thought of the divine activity. The more law the less God, men thought; and still the march of law went on, subduing province after province to its wide domain. The Christian doctrine of miracle fostered the evil tendency; it induced men to look for God, not in the uniformity of law, but in its apparent contraventions. Was ever a more terrible mistake. No wonder the Romanist prefers to think that miracles are still performed. And morally their faith is infinitely better than the belief that God is the great—Absentee. But even miracles are no longer able to disprove an *alibi*. The theologians argue laboriously to prove that they are in accordance with some higher law with which we are not yet acquainted. So for those who can still cherish this belief the divine activity is now limited to successive creations of new species, and for those who cannot, to an original act of creation, since which the world has been devoid of all immediate concern with the Almighty.

And so it is that natural religion is not now as formerly, the order of the day. There is great enjoyment of nature at the present time, and the knowledge of it is increasing every year; not only the knowledge which results from scientific observation and experiment, but that which comes from loving conversation of the painter and the poet with the ineffable beauty of the world. There was nothing in the ancient world that was a thousandth part so rich and full as our inheritance of natural facts and principles and laws. The book of Job marks the supreme attainment of the Hebrew mind upon the side of knowledge of the natural world and appreciation of its order, beauty, grace and charm. The New Testament is very barren in comparison. Sermons and volumes have been written about Jesus as "the interpreter of nature." They are a part of the idolatrous exaggeration of his personality. "Consider the lilies" is a royal passage, but it has no brother near the throne. It is solitary and unique. It is from country life, its homely aspects of the house and field, that Jesus draws

his lessons. In the meantime Homer's interest in nature is ever in her broadest aspects, and Virgil's mainly that of a gentleman farmer in his crops and trees. The modern world has multiplied a million fold the interest of both the Scriptures and the Classics in the natural world and the expression of this interest in literature and art. It has put behind it the morbid subjectivity of the middle ages, to which introspection was the only good, and their contempt for matter as the opposite of spirit and of nature as the enemy of God. The signs of this advance are everywhere apparent. You can see it in the poems that are written; in the books that are read; in the enthusiasm for landscape art; in the ardor with which the natural sciences are pursued and the multitude and splendor of their acquired results. And here and there, no doubt, the earnestness, the seriousness and passion with which these studies, avocations and vocations are pursued carries them over from the sphere of art and science into a province which, if not nominally religious, is surely near "those shining table-lands whereto our God himself is moon and sun." But that the natural religion of to-day has any adequate proportion to men's knowledge of the natural order and their delight in natural beauty—this is a proposition that cannot be successfully maintained.

How can this knowledge and this delight be made religious? We cannot go back to fetishism or polytheism, or to the external Creator, the man-like mechanician. As little can we be satisfied with an absentee Almighty, who wound up the world "in the beginning" and since then has left it very much alone. The cravings of the heart are for an ever-present, ever-acting Deity.

"The intelligible forms of ancient poets,
The fair humanities of old religion,
The power, the beauty, and the majesty,
That had their haunts in dale or piney mountain
Or forest; by slow stream or pebbly spring,
Or chasms and watery depths;
All these have vanished;
They live no longer in the faith of reason,
But still the heart doth need a language."

Is such a language possible in conformity with the conception of invariable and universal law and an unbroken sequence of phenomena? If not, well may we cry as Wordsworth did in bitterness of spirit:

"Great God! I'd rather be
A Pagan suckled in a creed outworn
So might I standing on this pleasant lea
Have glimpses that would make me less forlorn,
Have sight of Proteus coming from the sea
And hear old Triton blow his wreathéd horn."

But there is such a language possible, satisfying at once to head and heart, as Wordsworth proved when he proclaimed a presence that disturbed him with the joy of elevated thoughts, a presence far more deeply interfused than ever were the many gods of Greek religion, the one God of the Jews:

"A motion and a spirit that impells
All thinking things, all objects of all thought
And rolls through all things."

And Goethe proved it when he cried:

"What were a God who sat outside to scan
The spheres that 'neath his finger circling ran?
God dwells in all and moves the world and molds;
Himself and nature in one form enfolds;
Thus all that lives in him and breathes and is,
Shall ne'er his power, shall ne'er his presence miss.

That there is such a language possible our own
Weiss made full proof in that rarest bit of lyric rapture
that ever issued from his brain:

"He is the green in every blade,
The health in every boy and maid,
In yonder sunrise flag he blooms
Above a Nation's well earned tombs.
That empty sleeve his arm contains,
That blushing scar his life-blood drains,
That haggard face against the pane
Goes whitening all the murky street
With God's own dread lest hunger gain
Upon his love's woe burdened feet."

Nor less our Emerson when thus he sang:

"He is the axis of the star.
He is the sparkle of the spar;
He is the heart of every creature;
He is the meaning of each feature;
And his mind is the sky,
Than all it holds more deep and high."

And Tennyson as well:

"The sun, the moon, the stars, the seas, the hills and the plains
Are not these, O, Soul, the vision of him who reigns?
And the ear of man cannot hear; and the eye of man cannot see,
But if we could see and hear, this vision,—were it not He?"

And Browning too:

"He glows above
With scarce an intervention presses close
And palpitatingly his soul o'er ours!
The everlasting minute of creation
Is felt here; *Now* it is, as it was then;
His soul is still engaged upon his world."

And so I might go on; but these quotations are enough to show that there was never yet a thought of science which lent itself to poetry, and heart, and worship, more willingly and joyfully than does that which is the widest and the deepest truth which the study of nature has yet disclosed—that all phenomena material and spiritual alike are the organic products of an infinite and eternal energy from which all things proceed.

But it takes a long, long time for the great thoughts of philosophers and philosophic poets to sink into the general heart, and germinating there, to bring forth in due season the fair, ripe fruit of average conviction among men. Opinion is not faith. It does not become faith till it is wrought into the texture of the mind by innumerable motions of that noiseless shuttle which plays back and forth among the threads of thought and feeling and association on the great loom of time. But there will come a time when it will be as unavoidable for the great majority of men to think of God as the ever-present and indwelling life of all phenomena, as it was once for them to think of him as a mechanical creator, or as differentiated into as many gods and god-like beings as there are various phenomena in the natural world. Then once again will all phenomena possess a transcendental significance, and have a religious

import for mankind. In that day theology shall be again the science that dominates, because it will be the science that includes all others, and every law and harmony and adaptation that different seekers may discover in their separate fields.

But this natural religion of the future shall not like the natural theology of the past, imagine that it can construct its thought and feeling of the Deity entirely from so much of nature as is external to humanity. Is not the power which wells up in us as consciousness, the same as that which makes the planets circle and the roses bloom? The God were less than man whom we could find in nature external to humanity. But in the nature that is inclusive of humanity, we can find a God that is mind of our mind, heart of our heart, love of our love.

PSYCHIATRY, OR PSYCHOLOGICAL MEDICINE.

BY S. V. CLEVENGER, M.D.

Part I.

Knowledge increase, that has benefited the world in general, has particularly befriended the lunatic; nor is the cause of this difficult to understand. When men contended with other animals for supremacy and the result was uncertain, even temporary enfeeblement of mind or body often insured extinction alike for man or beast; and both were, through fear, ignorance and heartlessness, equally indisposed or helpless to aid their kind.

Ages elapse and gradually developed cunning and skill,—the acquisition, retention and transmission of knowledge, decided between the savage and his enemies; but the old instincts have been faithfully inherited by, and are but comparatively little modified in his "civilized" descendants, who, to within recent times, favored slavery, until the spread of knowledge taught how barbarous slavery was, and that same knowledge gave the strength and skill to overthrow.

Side by side with ignorance, upon which the politician fattens, is superstition, that in all times has enabled the spiritual ruler to dispute and share dominion. Temporal and spiritual rule coquet with and often combat each other, seldom indeed, for the public good, and the "herd" suffers most when these two powers combine.

All this precludes an endeavor to show why the treatment of insanity is upon such a low plane among us, and that it is science and not the church or state that has advanced the study of psychiatry and improved the condition of the sick in mind.

Scientific men have sought in vain to penetrate the stupidity and greed of "statesmen" for concessions toward a more humane and enlightened care of the insane; and the absolute indifference of the clergy, who arrogate the credit for all advances to themselves, keeps the people equally ignorant and indifferent except in the matter of occasional selfish and emotional solicitude about their own "souls."

Among the American Indians the "medicine man" officiates as priest and physician. To him sickness and insanity are diabolisms requiring noisy exorcisms. His diagnoses and methods of treatment are survivals from primitive times before medicine dared to protest against supernaturalism.

The chief of the tribe sometimes cuts short the ceremonies by ordering the troublesome patient to be abandoned to the wolves, a procedure equivalent to the olden European worse than neglect of such unfortunates.

The earliest provision made for the custody of lunatics in England was under the Vagrant Act of 1744, and we find the constable of Great Staughton, Huntingdonshire, recording a charge of *8s. 6d.* for watching and whipping a distracted woman, while Shakespeare causes Rosalind to mention "the dark house and the whip" with which madmen were punished.

In the early ages madness was regarded as the substitution of an evil for the real personality, necessitating beatings, starvation and other harsh "curative" measures. Whether this was due to the teachings of ecclesiasts, to the indifference of governments, or to the ignorance of the masses, or to all these causes combined it is difficult to determine, but it is beyond dispute that where church and state have not been aggressively inhuman in their treatment of the insane the conservatism of both has retarded proper medical care, and it is the advance of science that has suppressed political and sacerdotal barbarities generally and in this particular.

In consequence of the general philanthropic movements that preceded the French Revolution, Chiarrugi in Italy was foremost in condemning the brutal measures in use in asylums under governmental and priestly control. Next, Pinel sought permission from suspicious and reluctant officials to unchain his lunatics, and denounced the cruel usages common even among medical men of his day.

As a rule the ordinary practitioner of medicine is but little in advance of the political and ecclesiastical confederates of his age; most are actuated by the same motives, are quite as mercenary and are but little less superstitious than their associates.

Dr. Conolly who made such great reforms, and Dr. Gardener Hill were denounced by the English clergy and their ignorant following, lay and medical, for unchaining pauper lunatics and thus imperiling the community. Quite recently in New York, the Rev. Mr. Gibson fought against non-restraint for the lunatics in the Utica asylum. A clergyman politician at the head of a certain State Board of Charity, expressed regret that this board had been compelled to make an investigation into a horribly mismanaged asylum, as the stigma outweighed the advantages of the investigation.

D. Hack Tuke, the editor of the *London Journal of Mental Science*, a few years ago looked into the Longue

Pointe and Beauport asylums in Canada, both of which were under the control of a church sisterhood. The report of that investigation is accessible to all, and the cruelties therein narrated are almost incredible. About weekly you will read in the daily newspapers an account of broken ribs or other evidences of harsh treatment in political insane asylums, may be a hint at a murder, but those responsible for such things "investigate" themselves, and the public is calmed or regard the matter as another piece of newspaper unreliability.

Scientific medicine has had to contend with the stupidity, arrogance, greed and inhumanity of the average physician as well as against similar traits in others; hence I repeat that to the scientist and to none other is due the credit of humane psychiatry.

Esquirol adhered to the policy of his master and instituted more careful observations and records of symptoms, enabling him to make important advances in treatment. Bayle, Calmeil, and since them, numerous others, not only in strictly medical fields, but such as Herbert Spencer, Darwin, Huxley, Maudsley, Calderwood, Bain, Wundt, Carpenter, Meynert, Exner, Spitzka, through their biological researches have elevated psychological study to an exactitude little suspected by the mere prescription writer.

As Clouston says: "In a strict sense 'medical psychology' is a misnomer. If psychology is a real science it is one and indivisible, and you might as well talk of medical mathematics or medical physics. But as medical men seldom have the time, and only a few of them the special aptitude, for the study of the whole field of psychology, that portion of it which has a relation to their physiological studies and the practical work of their profession, has been divided off—not, it is true, by very defined lines—and called medical psychology, just as certain departments of electricity and acoustics may be called medical, *par excellence*. An unambitious definition of medical psychology might be 'mind—as it concerns doctors.'" "When we consider that one in every three hundred of the population is a registered lunatic, the marvel is how our profession has hitherto got along with so little systematic teaching or clinical experience of mental disease." It is owing to the ignorance among physicians of there being such a science as psychiatry (or psychological medicine), that they do not promptly seek the aid of the specialist in this department; but again, it is not so remarkable when we hear of the "busy general practitioner" with his crude apparatus and knowledge, undertaking eye and ear treatment, when only the very ignorant are unaware of the development of this branch of surgery as a separate science.

"It might well be argued," says Clouston, "that psychiatry is the highest branch of medicine, inasmuch as it is confessedly the most difficult, and relates to the most important part of man."

"Everything that lives, looked at from the evolutionary standpoint, tends toward mentalization, and all the tissues of all the nervous organs of all the types of animal life find their acme in the human brain convolutions. From the purely psychological point of view, too, a study of mental disorders is essential before the laws of mind will ever be understood. Pathological change always throws light upon physiological function."

Clouston's view that "mind—as it concerns doctors," is but a province of psychology, is true enough for the purposes of the alienist (the specialist in mental diseases), but as a specialist has been fairly described as "one who knows something of everything and everything of something," the alienist should be a psychologist in the broadest sense of the term. In his endeavor to make practical applications of physiological psychology he is or should be, *the* psychologist.

In addition to a medical education of a superior kind, which presupposes a respectable scientific and literary training, the practical psychologist should be able to read the three great living languages, for there is immensely more information of this kind printed in German than in French, and in French than in English. Including in his previous schooling such things as botany, zoölogy, geology, chemistry, he will find need for the superimposed biology, paleontology, physiological chemistry, practical microscopical study of the nervous system, which includes the brain, and not only the histology of man but of animals, and to some extent plants. Comparative anatomy, physiology and embryology as afforded by Huxley, Owen, Gegenbaur and Balfour, he will find fascinating reading, and his leisure can be profitably devoted to Herbert Spencer, from *First Principles* to *Sociology* and *Ethics*. He will thus be equipped to value the researches of Meynert, Exner, Munk, Guldén, Spitzka and other students of the minute anatomy of the brain. He then can estimate the importance and relationship of diseased brain and bodily conditions, found *post mortem*, with the carefully recorded observations made upon the living patient, in the way of a logical association of cause and effect.

In the better class of asylums in Europe the superintendent and his assistants are selected from among medical men for their special knowledge, of the kind mentioned, and their enthusiasm. Their abilities and singleness of purpose make them jealous of the care of their charges. They love their work; are proud of every success; they watch the progress of their cases and every physician, nurse and watchman is compelled to record full observations; the ignorant attendant is made less ignorant by training and is obliged to render proper service.

Such alienists are full of their subject and in love with it. Happily relieved by the government from any anxiety about getting a living, they are enabled to

develop astonishing skill in the care of the mentally un-sound; their writings abound in special journals and good work is promptly recognized and applauded by other alienists and the discoverer is stimulated to further successes.

The truly scientific individual detests an untruth, he has no use for shams, hypocrisy or pretense. Studying, as he does, facts from which to make deductions, falsehood is his abomination; and whosoever ventures into the circle of scientists and at any time in his career is discovered to have wilfully misstated, his place knows him no more, for upon the reliability of an observer depends the extent to which he will be quoted,—granting that his writings have any value. Bad logic might be overlooked, but a deliberate lie, never. Science thus begets truth and truth generates charity toward the unfortunate in proportion as truthful revelations disclose the frailties as well as the order of our human mechanism. Indeed one cannot be scientific unless he is sincere, believes in his work and is enthusiastic.

In such asylums development proceeds to such an extent, with the differentiation of labor, that admirable system and order arise beyond the comprehension of those unfamiliar with the work. Amid the exactitude demanded of each department to the common end that the insane shall be given their best chance toward a restoration to reason, cruelty can find no place and swift justice overtakes the attendant there in this day, if he uses undue force, to say nothing of blows, in managing his patients. There the doctrine of Celsus is not favorably regarded: "When the madman has done or said anything outrageous he is to be coerced with hunger, chains and stripes."

MONISM, DUALISM AND AGNOSTICISM.

BY PAUL CARUS, PH. D.

I define Monism as that conception of the world which traces *being* and *thinking*, the *object* and the *subject*, *matter* and *force* back to one source, thus explaining all problems from one principle. The word is derived from the Greek *monos*, alone, single, which is preserved in many other English words, as *monk*, a hermit who lives alone by himself; *monarch*, a ruler who rules alone by himself; *monotheism*, the doctrine that there is one God, etc.

Monism is thus opposed to dualistic views of life, according to which *being* and *thinking* are not only in opposition to each other but independent existences. To assert that the body is a material composition into which a soul has been placed, is dualism. Likewise it is dualism if you imagine that the soul, after death, leaves the body and lives somewhere by itself as a pure spirit. This rests on the dualistic assumption that an omnipotent spirit exists and was in existence before anything else existed; he created the material world, endowed it partly

with his spirit, and expects this spirit, after divers trials and tribulations, to return as pure spirit to himself.

If you take the very opposite view to this theological conception, it is generally styled *materialism*,—that the world was at some time only dead, inert matter, and that this dead matter, either by chance or by some process not yet fully understood, produced the wonderful cosmos with its feeling and thinking beings,—this is also dualism. Should you in either case object to the title of dualism, as you declare that in the former instance spirit is the one and only source of existence, and in the latter you propose matter to be the one and only principle from which all must be explained, monism nevertheless would be a wrong name. For in either case you have no unity of thinking and being but a oneness, which is gained by excluding the one or the other and reducing the world either to the former or the latter. Such conception of one-sided oneness I should rather call *henism*, from *heis, henos*, one. The root of the word henism is to be met with in a word like *hendiadys*, which, in rhetoric, is used if the same notion is presented in two expressions.

So monism does not only stand in opposition to dualism, but also to henism, viz.: that of materialism or of spiritualism. The unity of monism is not attained by denying the legitimate existence of either spirit or matter, force or matter, the subjective or the objective, but by treating both as a unity and having one common basis.

It is on this ground that all modern science rests; and especially physiological psychology is based upon it. German scientists were foremost to recognize the importance of this truth and accordingly they have coined the word monism.

The unity of spiritual and material processes in our brain was pointed out by many diligent workers in the fields of physiology, neurology and modern psychology. In a concise form, we have presented the monistic view to the readers of *THE OPEN COURT* in Professor Hering's excellent essay "On Memory." Let me quote from it a passage explaining the fundamental doctrine on which his inquiries rest:

"The physicist considers the causal continuity of all material processes as the basis of his inquiry; the thoughtful psychologist looks for the laws of conscious life according to the rules of an inductive method and assumes the validity of an unalterable order. And if the physiologist learns from simple self-observation that conscious life is dependent upon his bodily functions, and *vice versa* that his body to some extent is subject to his will, he has only to assume that *this interdependence of mind and body is arranged according to certain laws* and the connection is found which links the science of matter to the science of consciousness.

Thus considered, phenomena of consciousness appear

to be functions of material changes of organized substance and *vice versa*. As I do not wish to mislead, let me expressly mention, although it is included in the term function, thus considered, material processes of the cerebral substance appear to be functions of the phenomena of consciousness. For if two variables are dependent upon each other, according to certain laws a change of the one demanding a change of the other and *vice versa*, the one is called, as is known, a function of the other."

From the standpoint of monism the soul is no longer a metaphysical or transcendental entity. The soul consists of our feeling and thinking; as Wundt* says in his *Ethics*, p. 393: "The single activities of the soul as perceiving, feeling, willing, can be separated from the soul only by abstraction (or as English logicians would express it, by generalization). By themselves *they* are the ultimate indivisible elements of spiritual life. Thus if we want to take the soul as a separated entity, distinguishable from the contents of its consciousness, this soul is only an empty concept; we suppose it to be a real existence, while in reality, it is the mere unification and the constant cohesion of spiritual activities. As such, the soul is by no means an independent thing, which might be either a fact or postulate of experience; nor are perception, will or feeling, independent things."

Life is energy, and is produced according to the law of preservation and transformation of force. Heat may be changed into electricity, and any motion into either heat or electricity; so also life is a product of heat and it is no mere simile to say with Zoroaster and the fire-worshipping Sabians that the sun is the source of life and we derive our life from him. The molecular motion of the cosmic heat which, as we know, permeated the planetary system when it still was in the state of a gaseous nebula is the same heat which is now vibrating in the sunbeams, it can be and indeed *is* constantly transformed into that form of energy which we call life. The constituency of individual life is what we call *soul*, and this depends upon the form in which energy is manifested.

If Wundt calls the soul the mere unification and constant cohesion of spiritual activities, it is not to be thought of lightly as if it were a nonentity. It is the formal, as well as the formative principle, of its material existence, viz., the body. Mind is form; and the

*As the construction of the long German periods cannot be imitated in English without impairing the translation, I cite for German scholars the original version of the quoted passage:

"Wie die einzelnen, seelischen, Thätigkeiten, Vorstellen, Fühlen, Wollen, nur durch unsere Abstraction getrennt werden können, an sich selbst aber untheilbare Elemente des geistigen Lebens sind, so ist auch die Unterscheidung einer von dem Bewusstseinsinhalt verschiedenen Seele nur die Umwandlung des leeren Begriffes der Vereinigung und des stetigen Zusammenhanges der geistigen Thätigkeiten in ein reales Substrat. Dieses letztere ist in der That genau eben so wenig ein selbstständig in irgend einer Erfahrung gegebenes oder durch dieselbe gefordertes Ding wie Vorstellung, Wille, Gefühl selbständige Dinge sind."

importance of form as the spirituality of the world, we learn from the *beautiful* as it is represented in art. A poet of philosophical depth, as is Schiller, appreciated this truth when he identified *form* and *ideal* in his poem, "*Das Ideal und das Leben*," where he says:

"In den höheren Regionen,
Wo die reinen Formen wohnen . . ."

According to the principles of monism there can be no gap between the organic and the anorganic empire, and there is no doubt that all results of modern chemistry and physics favor a monistic solution. Professor W. Preyer, in discussing the hypotheses on the origin of life* rejects *generatio, æquivoca* and *heterogenesis*, and propounds that the interminable and beginningless motion of the world *is* life. Protoplasma is not a composition of dead anorganic substances, but organic life is an intrinsic, eternal, and indelible, quality of matter.

Monism is antagonistic to individualism, which treats the individual soul as an ultimate unit. Individualism is the tacit supposition of all utilitarianism in ethics, and, indeed, if the personal individual be an ultimate unit there is no reason why it should not consider itself the center of the universe. Individualism may be atheistic and deny the existence of a universal spirit, nevertheless it introduces another kind of God, the little God of man's own individuality, which, though insignificant, is no less dear to the single individual. Individualism considers all men as so many little Gods for whose gratification the world exists and moves. Monism teaches that single individuals are transient things which consist of the ideas they think and the ideals they aspire for. This affords a larger basis of ethics, which is neither exclusively altruistic nor exclusively individualistic and egotistic. It is not the individual who is an independent existence, but humanity which lives in the individual; and the great ALL lives in humanity. The individual is only one insignificant and transient state of the great development of human kind, it is one little link in the unmeasurable chain of life and its ultimate units, its feeling and thinking point beyond the narrow sphere of its existence. They point back to a distant past, for they are the outcome of the long development of former millenniums, and represent the labor of their ancestral generations. At the same time they point onward to the future as they are progressing, advancing and growing in every respect.

Monism is in opposition to the old theology, for there is no room in monism for the supernatural. Marvels and special revelations are impossible, if monism is a truth, and more than that, not only the intercession of a capricious Deity becomes a legend, but the supernatural itself is eliminated forever. In the monistic view, the supernatural exists neither *in* nor *above* nature. All is natural, and if you speak of God it is the great All in

which we live, and move, and have our being, of whom the Apostle says that in the end he will be all in all.

Monism has a definite and clear meaning, and should not be used for all kinds of doctrines which pretend to be unitary in some way or another. Nor should monism be identified with agnosticism. It is true that Haeckel says: "I believe that my monistic convictions agree in all essential points with that natural philosophy, which in England is represented as agnosticism." But mark, he does not say that he agrees with agnosticism. He agrees with the natural philosophy of men like Huxley, Tyndall and others on all essential points. But I doubt whether he would accept the philosophy of agnosticism.

Now, agnosticism is a philosophic view which professes to know nothing of the supernatural, and does not want to. The term was invented by Huxley, and I must confess it was no happy invention. To me it seems essentially the same as skepticism. Accordingly, I do not take it to be identical with monism, which is a doctrine of positive teachings, and asserts to know something. Their only point of convergency is that both reject a supernatural explanation of the world; both oppose dogmatical theology. But that is, as far as I can see, almost all. There is no positive statement made by agnosticism; both views have nothing in common but a common enemy,—supernaturalism. Agnosticism is a kind of transitory view which, if developed in the right direction, will lead to monism.

Spencer is generally styled an agnostic, and certainly he is no monist, although there are passages in his works which are decidedly monistic. In his ethics he is individualistic and utilitarian, and so on this most important ground he is, at least, not in consonance with monism. His doctrine of the Unknowable, it seems to me, is essentially agnostic, and even leaves room for the possibility of there being some supernatural existence.

How far Mr. Spencer is from monism, and how deeply he is entangled by his agnosticism, may be learned from some chapters of his *Psychology*, where he speaks of "the substance of mind." Although in other chapters he endeavors to formulate, and thus explain, all phenomena of mental life in terms of matter and motion, he declares, concerning "the substance of mind:" "We know nothing about it, and never can know anything about it." And the reason for its being unknowable is: "In brief, a thing cannot at the same instant be both subject and object of thought; and yet the substance of mind must be this before it can be known."

It is not my intention, now, to refute this assertion of Spencer's, nor will I enter into a discussion of his agnosticism; it would lead us too far. From the standpoint of monism a substance of mind is just as much a nonentity as a substance of electricity. Such ideas must be dropped as has been the doctrine of the *phlogisticon*, *i. e.*, the substance of fire, in which older physicists

* Rundschau, 1875, III, 55.

believed. In fine, it may suffice to state that monism is by no means identical with agnosticism. Just as well *something* may be like *nothing*, and the assertion that I know something of what is and is not, may be like the assertion that I know nothing beyond a certain sphere. In many respects the monistic view is even antagonistic to agnostic doctrines.

A CRITICISM OF MRS. ELIZABETH CADY STANTON'S ARTICLE "JAILS AND JUBILEES."

PRESENTED BY EDWARD C. HEGELER.

I believe that the worst enemy of woman is woman; it is not only a matter of fact that we find the strongest adversaries of woman's rights among the fairer sex, but ladies are always severest in judging and condemning the real or supposed faults of their sisters. This truth was re-impressed upon my mind when I read Mrs. Elizabeth Cady Stanton's article "Jails and Jubilees," and it is the more noteworthy as she is one of the most prominent defenders of woman's rights. I never read a harsher criticism on Queen Victoria than hers.

It is not now the object to enter into a discussion of the merits or demerits of the Queen of England's government, but whatever we as Republicans may think of royalty, it is not just to make her personally answerable for social and political evils which are not in her power to mend.

It is a common saying among Englishmen that *a queen is the best king*, and this is said chiefly in remembrance of Queen Elizabeth and the present ruler of England. It certainly does honor to Queen Victoria. And if, after a long reign the English people intend to celebrate her jubilee, this shows that to a large extent they are satisfied with her doings.

Some ancestors of the Queen's were dissolute spendthrifts; she, as a good wife and mother is thought by many to have been too economical. If Queen Victoria saves money for her children she thereby sets a good example to her people and to us Americans also. Let us here not forget that saved money must be invested somewhere and that invested money is paid out for labor in some manner useful to the public and so helps to prevent poverty.

A stranger is not warranted in denouncing jubilees in foreign countries, just as a guest in our land ought not to scold us, if we prepare to celebrate a memorial day in honor of a national event.

It is the just pride of a mother to have many children and do her best for them. To say the least, it is very indelicate of Mrs. Stanton to speak of the queen's family as her "innumerable progeny." It is also unfair to disparage the Prince Consort whose noble-minded spirit is well known in history. His faithful efforts as private counselor of the Queen

and his promotion of industry, art and science should be especially appreciated, on account of his difficult position in his home and in an adopted country. Is it just to say of such a man that he "never uttered one lofty sentiment or performed one deed of heroism?"

And have not Queen Victoria and her husband shown to the world a model family life?

Mrs. Stanton, no doubt, has the best intentions in objecting to what she supposes to be extortion and tyranny, and I am sure she deserves the high reputation she enjoys for her active work in the elevation of woman; but all the more a *faux pas* of hers will be injurious to that cause. Certainly Mrs. Stanton will not promote it by rousing an unjust and useless indignation against a woman on a throne.

DE PROFUNDIS.

BY ELIZABETH OAKES SMITH.

"The eternal silence of these infinite spaces terrifies me."—*Pascal*.
Space beyond space,—unthinkable,—eterne,—

Vainly we number add to number vast,
The limitless infinitude to learn;—

Where are the stars that should an index turn?
Where red resounding comet, flirting past?

Poor human heart! vainly thy pulses yearn;
Silence, eternal silence coldly reigns,

In heavy fall of darkness and dim night,
Thy cry of terror, thy appealing call

Go echoless along receding plains,
Where silence sits in her unconquered might.

Oh, silence! terrible is thy mute fall.

SONNET.

BY ILDA POESCHIE.

E'en like a sculptor, youth doth mold our faces;
At first as soft as artist's pliant clay,
Then like his marble fairer day by day
We grow, enriched by thousand changing graces.

Then youth withdraws and thoughtful, paces
In artist-mode, to gaze from far away;
But Time, the master, murmurs: "'Tis but play,"
And sternly chisels o'er these, deeper traces.

In vain youth's genius tries again to waken
The smiles that flitted o'er the dimpling cheek,
And since all beauty from his work is taken,

Another fresher model doth he seek;
And we are by our loving star forsaken,
While Time completes his sculpture week by week.

A great idea, a sublime purpose, slowly taking form, through years, possibly centuries, suddenly possesses an individual and stands forth incarnate. This individual is then the concrete expression of the best intuitions and highest aspirations of his time. Through him the ideal become real, and fresh impetus quickens humanity's pace toward the good. The influence of such an individual is incalculable. The memory of his character is potent with uplifting force; the more potent in that he has but exemplified some of the grand possibilities of human effort.—*G. M. B. in Religio-Philosophical Journal.*

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixon Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of THE OPEN COURT is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to THE OPEN COURT should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, MAY 26, 1887.

LIBERALISM.

The word "liberal" in this country is commonly applied to unorthodox religious views, and to the person who holds to them. In the large class designated by the word are those of every degree of culture and social standing, of widely different tastes and of opposite views on almost every subject outside the province of demonstrable knowledge. Their agreement in rejecting theological dogmas by no means helps them to unity of thought in party politics, on questions of finance, on social problems, or respecting the multitude of other questions, practical and speculative, which constantly present themselves for the consideration of the thinker and the reformer.

In their religious views and attitudes even, liberals differ widely. Many have outgrown much of their old belief, yet feel an indefinable reverence for the Christian name, and derive satisfaction from the thought that the book in which their fathers and

mothers believed through all the tribulations of life, and found comfort in the solemn hour of death, is inspired, at least, in a general sense and to a greater extent than any other work. Others who utterly reject Christianity, considered as an extra-human element introduced into the life of the race, yet recognize it as a great system that has been suited to man's condition in the past, and that should now be interpreted with the most liberal construction, the name being retained and made to stand for the highest thought and noblest work of the age, the grandeur and glory of which they maintain is due, in no small degree, to the powerful impulse received from the character and teachings of Jesus. Others who decline to be called Christians, yet concede to Christianity, in common with Buddhism and other religious systems, an important part in the growth of civilization, and view it not with disdain, but as a religion which, with all its imperfections, has persisted because it has represented man's best thought and aspiration, from which it grew as naturally as the flower grows from the seed, the soil and the air. To many liberals, however, Christianity appears an unmitigated evil, a superstition, which, although it had its origin in innocent ignorance, and credulity, has been the greatest obstacle to human progress that man has had to encounter. Others still, although they belong to the class that the science of the age is leaving far behind, regard Christianity as an imposture, devised and designed by crafty men to enslave the human mind, and to enable them to control it in their own interests.

While some liberals have a firm belief in, and a reverent regard for the name of God, and a strong belief in a future life, others are unbelieving or doubtful as to these doctrines. Many who have rejected the authority of ancient revelations still believe in modern revelations from the spiritual world, and commune, as they think, with spirits directly or through "mediums." Other liberals regard spiritualism as a superstition worse than the one its adherents claim to have outgrown. Some liberals declare that the only real and permanent reality is mind, of which matter is but a conception or form of thought; others say that matter is the only reality while mind is but one of its properties or modes. Others hold that both mind and matter are phenomenal existences and manifestations of an ultimate reality, of which matter and force are but symbolical representations. In contrast to these several monistic conceptions are held dualistic theories, in which mind and matter are two principles, co-eternal, but distinct.

While to most liberals the word religion is pleasant to the ear and dear to the heart, since to them it

stands for the highest in thought and endeavor, to others who associate it with theological dogmas it is offensive; and such say, with Hobbes, that the only difference between religion and superstition is that religion is superstition in fashion, while superstition is religion out of fashion.

Liberals have arrived at the views they hold by different methods and under widely different conditions. One class has abandoned theological beliefs in an atmosphere of religious bigotry and under influences that have stimulated the critical and combative tendencies. Their zeal and their methods are very liable to be much like those of the theology which they imagine they have outgrown. Another class is composed of persons who have parted with their early religious beliefs amid influences in harmony with their feelings, who have but little, if any, knowledge of Holbach, Voltaire or Paine, who feel no hostility to Christianity, which, indeed, they would be glad to see reconciled with reason and common sense. In this class are included many Unitarians, whose position results from lingering feelings of attachment to a system which they have intellectually outgrown. Another class of liberals has never been much interested in religious subjects; has never had any personal experience of the suffering involved in the conscientious rejection of religious doctrines, once intensely believed, but is unbelieving from a predisposition to skepticism, from intellectual inability to accept unproved propositions and indifference to questions of a speculative and unverifiable character. Persons of this class are the least enthusiastic, the least aggressive and the least interested in special liberal organizations.

Then among liberals are those of constructive and destructive disposition—those who, even though they agree on many points, have but little community of thought or feeling in their work. Considered simply as a protest against prevailing theological beliefs, liberalism is necessarily iconoclastic, and when men first perceive the error and folly of dogmas in which they have been educated, without comprehending the positive thought that must replace the discarded doctrines, they are liable to put undue emphasis on the destructive side of thought, and to be unsympathetic in criticism, indiscriminating in denial and intemperate in denunciation. Such may feel more interest in a work pointing out the defects of the Bible than in that of the advanced liberal thinkers who are impressed with the importance of positive constructive work in the domain of science, history, art, and of political and social as well as religious reform, and are devoting their energies to their respective provinces with splendid results.

Thus we see that the word liberal as commonly used is applicable to a very large number of persons, among whom there is the greatest difference as to ability, attainments, aim and spirit and the greatest diversity of belief. When representatives of matured and scholarly thought find themselves classed with all sorts of cranks and self-styled "reformers" under the general name "liberals," and find their names used in connection with the crudest thought and often the wildest vagaries with which they have not the slightest sympathy, it is but natural that they should prefer to be known by some more definite name, and encourage the use of words which will make such distinctions as are necessary to a fair understanding of the positions of all thinkers and workers, thereby helping to remove that confusion in the public mind which associates the best thought of the age with all the fantasies, follies and fanaticism that pass current under the name of liberalism.

With so much diversity among liberals it is not strange that they have never united in a general organization. Organizations on the broad plan of the Free Religious Association, and of the Ethical Culture Societies have done and are doing good work, and they will continue to have earnest supporters in the future; but let no one imagine that the strength and value of liberalism are to be determined by its capacity for organization. Progress is now, as it has been in the past, along the line of existing beliefs and institutions; and its results are seen in the continual modifications of the old rather than in special creations of something new. They are observable in the tone of the press, in the teachings of the pulpit, in improved legislation, in the character of our general literature, in the growing charity and tolerance, and, above all, in the increasing intellectual freedom—a condition which insures progress in every direction. Without any great general organization, liberalism—all that is worthy of perpetuation comprehended under this name—is exerting everywhere, in the churches and outside of them, a profound, multiplex and far-reaching influence. Meanwhile all who are making direct contributions to the world's thought, or are stimulating others to think, are furnishing material for a great comprehensive system of philosophy, which, as Professor Denslow says in one of his essays, "will be too composite and heterogeneous to bear the stamp of any one thinker in any special degree of predominance over all others."

BLASPHEMY.

In the daily papers have been printed reports of the trial for blasphemy of Charles B. Reynolds, an ex-preacher of the Seventh-day Adventists, at Morristown, N. J. The ground of complaint was that

Reynolds had circulated a pamphlet ridiculing Christian doctrines and containing a cartoon representing himself as "Casting Pearls before Swine." He was defended with ability and eloquence by Col. Ingersoll, but was convicted and fined \$25, with costs. The law on which the indictment was based, is over a hundred years old, and has, as Ingersoll says, "slept like a venomous snake beneath the altar of liberty," this being the first blasphemy case ever tried in the State. From descriptions of it given in the papers, we infer that the pamphlet is coarse and of a character to reflect no credit upon its author, whose style and methods seem to be much the same that they were when he was a preacher; but on no just grounds can either the conviction, or the law under which the trial occurred, be defended.

Blasphemy is a fictitious offense, an imaginary crime for which the honest and best men have been subjected to imprisonment, torture and death. It is still punishable in the most enlightened countries at both common law and statute law. In England and in the United States are laws unrepealed under which are men, every now and then, tried, convicted and sentenced for expressing disbelief in God, in the Divinity of Christ, and in the superhuman origin and character of the Bible. Of late years there has been a disinclination in the secular courts to pronounce such disbelief blasphemy, and a disposition to make it consist rather in speaking, writing and publishing profane words, vilifying or ridiculing God, Jesus Christ, the Holy Ghost, the scriptures or the Christian religion, in a way to bring it into contempt. According to the latest English judicial opinion, that of the Lord Chief Justice in the case of *Reg. vs. Foots*, no opinion, however anti-Christian or even atheistic, can any longer be regarded from a legal point of view as blasphemous. The blasphemy must consist in the manner in which the opinion is expressed, not in the character of the opinion. While this decision indicates progress, the law, as thus interpreted, is still open to grave objections. There are many whose opposition to popular religious belief, although far less effective than that of John Stuart Mill, George Eliot or Matthew Arnold, is just as sincere, and whose language must necessarily be more offensive to the rigidly orthodox. Why characterize their expressions as blasphemous? So long as theology teaches such absurdities as are in the creeds of the churches, it need not expect to escape being ridiculed more or less as people outgrow it. Its defenders should consider as Conway says: "That there are more muscles to draw the mouth up than to draw it down, and that man's control of his risibles has its limits." Did not the early Christians ridicule the faith of the Pagans and kick over their idols?

Were not cartoons and caricatures freely used by the Protestants against the Pope during the Reformation? True, we live in a better age, and coarseness in the advocacy of opinions is not in harmony with the best methods of the day, but let not the law impose upon the discussion of Christianity any restraints which are not imposed upon the discussion of other subjects. Science asks no protection from ridicule; none should be extended to Christianity. The law in regard to blasphemy should be abolished altogether. An expression of belief or unbelief should not be punished because it is offensive to those whose views are assailed. If men treat religious subjects in a manner contrary to good taste and good judgment, this offense can wisely be left to the condemnation of public opinion. Let the State not interfere.

The cause of free religious inquiry in Scotland has been greatly strengthened, as has already been noted in this journal, by the bequest of the late Lord Gifford, who has left £80,000 to establish four Lectureships or chairs of Natural Theology, one at each of the Scottish universities. It is a striking illustration of the growing liberality of thought in the church of Scotland, that several of her most distinguished professors have of late spoken in condemnation of the strict exclusion of all theological teaching, other than orthodox, in the universities. This splendid gift will secure the establishment and permanence of liberal religious teaching, which without this impetus would probably have been long deferred, since there is not as yet sufficient public or State approval to insure its adequate support. The conditions of the will require assent to no dogma or theological test whatever. The lecturers are to be entirely free to teach their own beliefs, whether they are Christians or Agnostics, in short "of any religion or way of thinking," the only requirement being that they shall be "reverent men, true thinkers, sincere lovers of and earnest inquirers after truth." The subject will be treated as a "natural science" and the lectures will be open to all who may wish to attend, whether students or not.

* * *

George J. Romanes writes on "The Mental Differences between Men and Women," in *The Nineteenth Century* for May. He regards the difference of brain-weight (which "is about five ounces") between the average men and women, as evidence of greater intellectuality in the former and finds it the result of the evolutionary process in which man has gained the advantage because of his constant leadership in the affairs of life. In some other respects he looks upon woman as the equal if not the superior of man, and grants her the superiority in not a few. While he insists that there are fundamental differences which

do and always will make man distinctly man and woman woman, he holds that the question of inferiority will be forgotten, as it deserves to be, and quotes Mrs. Fawcett, who says: "All we ask is, that the social and legal status of woman should be such as to foster, not to suppress, any gift for art, literature, learning, or goodness with which women may be endowed." The result of this will be the development of a constantly increasing measure of mentality in woman, uplifting her till she is the perfect complement of man.

* * *

Rev. W. Benham writes in *The Fortnightly Review* for May administering a well-deserved rebuke to Dean Burgon, whose article in a recent number criticising Canon Fremantle, was bigoted and intolerant in the extreme. Mr. Benham asserts that there are large numbers of the clergy who no longer accept the views of Dean Burgon, and to whom his "furious onslaughts" in a style "which may be called noisy and violent," are anything but convincing. The theory of evolution which Dean Burgon calls "the weakest of unphilosophical imaginations," is one which is recognized by the clergy as being strong reinforced by evidence and is being accepted by many of them whole or in part. Thus Mr. Benham says, "The Dean may be assured that the case has hopelessly gone against him here," and "that he will soon be left alone."

* * *

Of great interest to the antiquary is the discovery of the mummy of Rameses II, the Pharaoh of the Bible, during whose reign the Israelites are said to have "sighed by reason of their bondage." The tomb containing the mummy of the great king, as well as of those of about forty other kings, queens and princes, has long been known to a few of the natives, but was kept a secret by them for pecuniary reasons, until Herr Emil Brugsch Bey, curator of the Bûlâq Museum at Cairo, was guided to its entrance by an Arab who had been led to betray his trust by a liberal offer of "bakhshish." The royal mummies were taken out and unrolled, whereupon abundant evidence was found to show that they were indeed those of the Egyptian "oppressor" and his ancestors. They were soon taken to Cairo, where, incased in glass, they may be seen at the Bûlâq Museum.

* * *

The "Hydrophobia Bugbear" is the subject of an article by Dr. Edward C. Spitzka in *The Forum* for April. The results of careful investigation have led him to believe that a large majority of cases of so-called rabies are spurious, the real trouble being that the persons bitten become so wrought upon by fear that nervous disorders of peculiar characters are the results. He adduces

cases of apparent hydrophobia produced by the bite of dogs that were not mad, as their ultimate recovery proved. He looks upon the institutes for the cure of rabies as means of increasing the popular apprehension, and consequently of developing a larger number of supposed cases. Lastly, he declares that the symptoms that are commonly assigned to rabies are fictitious; that it is impossible for a dog to inoculate a man with a disposition to bark and run about on all fours, just as it is impossible for a man to inoculate a dog with the power of speech and an upright gait, and demands that this truth be at once inculcated in the public mind.

* * *

Apropos of the much debated term "Agnostic," Mrs. Julia Ward Howe, in a recent lecture given at Parker Memorial Hall, Boston, Mass., on "The Ignorant Classes," said:

This is a subject we hear much about nowadays. I would first ask, in relation to it, "Ignorant of what?" All people are ignorant in some respects. There is individual ignorance and class ignorance. People of philosophical habits in these times call themselves "agnostics," which, were it not for a former political significance of the name, might be translated, "know nothings." Such people have in all ages kept in view the limitations of knowledge, and the boundless extent and number of the things worthy to be known; they described themselves ignorant in view of the immense disproportion between what they wish to know and what they can know.

* * *

Matthew Arnold reviews the course of recent British politics "Up to Easter," in *The Nineteenth Century* for May. He finds anything but a satisfactory past; Liberal politics having long been affected with "half-heartedness," and not being "sanguine" about their future, he favors the continuance in power of the Conservative party, and asks, "Why, then, should we be so very eager to take up again with the 'tabernacle of Moloch,' Mr. Gladstone's old umbrella, or the 'star of our god Rumphan,' the genial countenance of Sir William Harcourt, merely in order to pass forty years in the wilderness of the Deceased Wife's Sister?" If the government will quell anarchy in Ireland, give her a sound plan of local government and make the land laws just, he will support it, and he believes that the British people will do the same.

* * *

The Westminster Review, entering upon its sixty-fourth year becomes a monthly, and issues an announcement of its purposes past and present. It has been called "The Cradle of English Liberalism" and was one of the first voices raised in favor of free trade. It becomes a monthly publication in answer to the demand for periodical literature which the constantly increasing liberalism of the age is making.

Original contributions from the pen of Prof. F. Max Müller, will soon be printed in THE OPEN COURT.

COPE'S THEOLOGY OF EVOLUTION.

BY DR. EDMUND MONTGOMERY.

Part II.

If refutation and not elucidation were the object of this criticism, we might leave Professor Cope's theological craft hopelessly wrecked among the psycho-physical breakers. Before having come within fair sight of biology and evolution, the venturesome sailor struck the most perilous reef in the wide sea of knowledge, where so many goodly ships have stranded. The strait between Scilla and Charybdis was not more fatal to ancient voyagers, than the puzzle of mind and body proves to be to modern philosophers.

The conclusions of the *Theology of Evolution* having been reached through biological studies from the evolutionary standpoint, we will first show what strange logical outcomes this mode of procedure involves, and then we will endeavor to estimate the merits of Professor Cope's peculiar views of vitality and evolution, that have seemed to him to warrant his theological speculations. This biological examination will compel us to give careful attention to the great problem of the relation of mind to organization.

Professor Cope's Deity or "great Mind," to whose "active exercise of mentality" we are told "all evolution is due," must—when rightly contemplated,—be deemed vastly *inferior* in all essential respects to the "lesser minds" that are "a part or fragment of it." On first consideration it may appear rather strange that fragments should be so much superior to the whole from which they are derived. But, then, we would naturally suppose, or at least we would sincerely hope on moral grounds, that this active exercise of mentality on the part of the great Mind, to which evolution is due, is being exerted to some good or useful purpose. It would be token sheer insanity in the great Mind to amuse itself, by most laboriously splitting its being into a number of lesser minds that were not an improvement upon its own undivided self. The great Mind is conceived as connected with the wholly unorganized state of matter; indeed as being the property of the primordial "unspecialized" substratum, with which evolution starts. Now, we all know, that in proportion as matter gains in significance and efficiency by the progressive evolution of organic forms, the mind of these forms gains likewise in significance and efficiency. This at least is what experience clearly proves. The scale of progressive evolution, in which organic *forms* are ranged, is also the scale of progressive *mental* evolution. The less advanced the organization, the more inferior the mind. And as the great Mind is the property of wholly unorganized matter, it must necessarily be the most inferior of all minds.

And when it comes to the higher exhibitions of mentality, the Godhead lodging in primordial matter is left still more incommensurably behind. Professor Cope

says himself, that "the knowledge of what is right and the disposition to do right" are faculties that "have been developed by use into the habit of so acting; and the acts which men perform naturally follow the organized character they possess." The moral nature of man as evinced in his social relations is an effect of "the mutual pressure each man causes toward his fellow men with regard to his conduct toward him." (p. 35.) It strictly follows, that the Deity, who has no "organized character," and who does not enter into social relations, must be totally devoid of morality.

It is evident then, that the great Mind of the theology of evolution, if it existed at all, would be mentally deficient, and a moral nonentity.

Furthermore, if mind is a property of matter, as Professor Cope maintains, and if, as he willingly concedes, just in proportion as matter becomes more highly organized, the mind connected with it becomes also more highly developed,—what under these conditions are our chances of immortality? An "inseparable bond" binds us "forever to a material basis." The material basis undergoes after death a rapid retrograde metamorphosis; it follows that the qualities or faculties of our mind, which had entirely depended on high-wrought vital organization, decay and dissolve at least as rapidly as their material substratum. Our immortality would then consist of whatever mind is left in the scattered elements of decomposition; the mind of water, carbonic acid, ammonia, etc.

It must not be thought that the plain and rudimentary remarks we have just been making were advanced merely to divert ourselves at the expense of a Deity who is the property of matter. We understand perfectly well how a philosophical naturalist and especially a biologist, finds himself utterly incapable of conceiving mind, individual or general, floating about in vacancy attached to nothing. In exposing here the absurdities to which the conception of mind, independent of organization, necessarily leads, we had in view not only the special conception of the "great Mind" of the *Theology of Evolution*, but the conception of any kind of mind not connected with organized individuality.

No one can be more realistically aware of the dependence of mental evolution on organic evolution than Professor Cope, who has studied so minutely and understandingly the correspondence obtaining between the progressive scale of life and that of mind, as traceable in the records of our planet. How, then, has so highly distinguished a scientific observer and thinker ever come to indulge in such fantastic notions about the objects of theological faith? The reason is not far to seek. Just because Professor Cope is not a mere narrow specialist, but is sympathetically alive to the great questions of our time; for this reason have his scientific researches—however accurate and important in themselves—

conducted to yield to him answers also to those great open questions, on which our ultimate hopes and fears are pending. He himself says: "An occasional flight into this region of thought at least brings the thinker into sympathy with the thoughts of his fellowmen." (*O. of F.*, p. 420). We heartily approve of this sentiment and willingly follow him in his larger quest, knowing well that careful researches into the constitution of reality furnish the right medium for such "occasional flights." It is no longer from verbal traditions or conceptions about the concerns of the world, it is from a scientific insight into the world itself, that the rational mind is expecting a solution of these supreme questions,—questions whose accepted answers have ever been molding and will continue to mold, social conduct. To understand our present philosophical and scientific position toward them, we have to go back to the starting point of modern science.

Descartes was the first to draw a sharp line between a material world governed by *mechanical necessity*, and a mental world deriving its *ideal inspirations* from God, the *ens realissimum*. Mechanical principles were soon mathematically systematized and brought to bear on the outer world with a success that initiated a new era in human thought. The chaos of capricious occurrences that had made up the previous conception of nature became in this steady light an ordered universe, following with never-failing constancy and precision the laws of mechanical necessity. But now, more than ever, the two disparate spheres, that of mind and that of matter, seemed utterly incommensurable, the former originating intuitively and at will its wide range of pliant figurations, the latter proceeding undeviatingly through time and space, rigorously compelled from moment to moment by equivalent causation.

There remained, however, one domain of material existence which refused to comply so readily with the demands of mechanical science. To unsophisticated observers the body of living beings seemed to be formed and actuated by forces not reducible to the mechanical standard. Descartes himself—blinded by the recent discovery of the circulation of the blood, which he believed to be an entirely mechanical phenomenon—would not admit such a distinction between organic and inorganic nature. He simply and consistently declared all organisms to be nothing but mechanical automata to which, in the special case of the human organism, a thinking soul was superadded. To subsequent observers, living organisms, in which mind and body are so strangely blended, became the hotly contested ground, for the possession of which were struggling, on the one side the mechanical interpretation, on the other side the supernatural interpretation. And one must confess that it is in all reality, a trying task to make out how far mechanical laws have here sway, and how far other explanatory principles have to

be called in. One is forced to recognize that the organism is interposing a specific medium between the mutual intercourse of the physical and the psychical order.

The modern world-conception had, then, three distinct spheres of *manifest* existence to harmonize, the outer universe, the organism, and the mind. And it is in this perplexing endeavor that we find ourselves still busily engaged.

Kant, inspired by Newton, framed the nebular hypothesis, accounting on mechanical principles for the present disposition and motion of cosmical masses. Under this point of view it became obvious that organic beings must have been somehow evolved during the development of our planet. Kant himself tried hard to extend the mechanical interpretation to organic forms, for he firmly believed that teleological considerations had to be excluded from the science of the material world. But he was too profound and conscientious a thinker not to become convinced that the manifest teleological constitution of organic forms and functions cannot possibly be mechanically explained. He formulated a theory of descent and gradual development much earlier than Lamarck and others, but found himself, even then, driven to assume that our mother earth must have given birth to primitive organisms which contained potentially the generative drift of all succeeding evolutions of living beings. This hypothetical endowment of our planet with an all-efficient maternal fecundity was, however, little in keeping with its avowed mechanical constitution. Evidently, the origin and development of living beings in the course of *mechanical* world-formation was as perplexing a question then as it is at the present day, despite the specious discussions of the *Synthetic Philosophy*. Mechanical evolution and organic evolution cannot be made to blend harmoniously.

And, from another point of view, the fundamental divisions of our modern world-conception refuse no less to blend. For how is mechanical necessity to be reconciled with volitional activity of a hyper-mechanical kind? Kant, who examined our mental constitution more exhaustively than had ever been done before, discovered nothing but necessity in its immediate interaction with the outside world. Perception, as well as conception, seemed to him strictly determined by arrangements not allowing any free play on the part of our volition. Our mental faculties he held to be competent to deal only with the sensible world. And everything appertaining to the sensible world was in his opinion governed by fixed and unalterable conditions.

There was, however, still one outlet left for liberty to assert itself. For, however complete the sway of necessity may be in our world, it cannot be denied that in our moral actions at least, we do not yield to it. With a transcendent power of spontaneous or free causation, emanating from the depth of our being, we overcome

mechanical compulsion and bend it to our higher purpose. We impose on the insentient mechanism of nature the moral injunctions recognized by reason. Kant accounted for this enigmatical power of ours to transfigure the physical nexus of perceptible things in conformity with ideal conceptions; a power which he erroneously restricted to purely moral doings, he accounted for it, by making it flow into nature from a supernatural sphere, where he believed our moral being to have its veritable home.

This breaking through natural law from above and within by strength of free volitional causation, sanctioned thus by the leading thinker of the age, was soon followed by a general revolt against physical necessity. Spreading from Germany to France and eventually to England and America, this philosophical re-assertion of human spontaneity received additional impetus from individual and social aspirations, roused by Rousseau, the French revolution, and Shakespeare, and soon it fused its own spirit of freedom together with that of the renaissance and the reformation, into one impetuous protest against the deadening fatalism of inflexible causation and external compulsion.

To understand the enthusiasm which this movement kindled and is still sustaining, a movement represented by Emerson in this country, by Coleridge and Carlyle in England, by Cousin and Jeffroy in France, by Fichte, Schelling and Hegel in Germany. Fully to understand this excessive outburst of mental exultation we have to remember that Newton's method of interpreting physical phenomena had gained ascendancy also in the interpretation of mental phenomena. The sensation-philosophy, which became victorious in England and France, originated avowedly in the attempt to explain mental occurrences according to Newton's method. And even Kant declared his researches into the constitution of the mind to be guided by Newtonian principles. The prevailing philosophical impression was, that mental phenomena are subject to a causal enchainment as rigorously determined as that of physical phenomena. In its extreme nihilistic form the sensation-philosophy had reduced us and the world to a congeries of elementary sensations, constituting through gradually established habits of association a matterless, soulless, Godless realm of phantasmal appearances.

This self-annihilating view of things was by no means flattering to human pride, nor could it be any more reconciled with the actual experience of volitional spontaneity than the theological dogma of predestination. We cannot wonder, then, that those, who under the influence of free-thought had liberated themselves from the authority of biblical traditions, without becoming converts to the scientific creed, gave now eager welcome to this rationalistic re-assurance of individual self-determination.

Meanwhile, natural science, within its own domain, followed triumphantly its clearly defined course, explaining physical occurrences by means of the agitation, aggregation, or dispersion of masses through mechanically imparted motion, and feeling baffled only when brought face to face with the problems of vitality and organization. Here, mechanical effectuation was more or less clearly discerned to be incompetent to build up organic forms and to infuse life into them. Thus, while physicists in their special field of research had long ceased to have recourse to supernatural aid, biologists felt still compelled to invoke some kind of *deus ex machina*, if not always to explain vital phenomena, then at least to account for the origin of living beings.

Linnæus by a gigantic effort, had succeeded in bringing order into the chaos of organic forms. This order, by which naturalists now for the first time were enabled to subdue to human comprehension a vast confusion of morphological similarities and differences—was based on the special creation and subsequent stability of every distinct species. And though in the course of time evolutionary ideas of various description came to haunt biological science, serious investigators were naturally loath to relinquish the principles underlying their well-systematized knowledge, only to adopt some other insufficiently supported theory. This feeling among biologists was still paramount when Darwin's work on the *Origin of Species* made its first appearance and turned forever the tide in favor of gradual and progressive evolution.

The scientific persuasiveness of Darwin's view lay in the demonstration of natural selection as a directing influence actually at work during the struggle for existence; an influence eliminating less useful and preserving more useful variations, so that the latter are enabled to cumulate in the race. The occurrence of a profusion of most manifold variations is presupposed in this evolutionary conception. But this was no serious hindrance in the way of its acceptance, for the existence of frequent variations from the scientifically fixed types had proved too perplexing to professional systematizers to have been overlooked. So soon, then, as natural selection was admitted to be a veritable cause furthering the cumulation of varieties in specific directions, the entire domain of organic forms became fluent to the mind's eye, and was perceived to have been always plastic to this same molding influence. Geology, paleontology, comparative anatomy, embryology, all chimed in to confirm this newly acknowledged truth of gradual transformation and to emphasize its progressive tendency.

It is a historical fact which can never be overturned, that the adoption of the evolution-hypothesis on the part of science, and the general spread of the evolutionary world-conception, have to be dated from Darwin and from no one else.

Mechanical biologists were not slow to make most of this mode of organic development and adaptation, effected seemingly by purely physical causes without the help of any teleological principle. Some of us, however, knew at once that natural selection itself cannot rightly be taken as the productive cause of organic evolution. For, it is obvious that an occurrence which enables something to be preserved does nowise account either for its production or for its actual mode of preservation. Natural selection can only *favor* the preservation of what was brought into existence and is being preserved by other means. Yet, it must be admitted that natural selection possesses a kind of shaping efficiency, an efficiency remotely akin to that of the sculptor who forms his statue by chiseling off chip after chip of useless material. Darwin had before him the results of artificial selection, where the breeder by cumulating varieties in intended directions, succeeds in transforming organic shapes and functions to suit his purpose. In natural selection the specific surroundings, by means of which and against which organic life is carried on, constitute a positive influence favoring those individuals that happen through advantageous variations to be best adapted to the given situation.

But how do advantageous variations come into existence? This, after all, is the cardinal problem of evolution. And it is the one to whose solution Professor Cope is principally devoting his energies. Not the *survival* of the fittest, but "The *Origin* of the Fittest."

What is the power that from within creates those progressive modifications of structure and function, through which organisms become not only better adapted to the relations already subsisting between them and their medium, but through which, moreover, entirely new relations are originated, extending in additional specific ways their sphere of interaction.

Here, in a more definite form than ever before, the great strife between external mechanics and internal spontaneity, the old, old strife between cosmical necessity and individual liberty, is again forcing itself upon our attention. A few years ago mechanism in the domain of organic life seemed to have it all its own way. Now, in various guises spontaneity is beginning to reassert itself. The belief is gaining ground that a definite formative and evolutionary power has inhered in primitive forms of life, compelling—as in reproductive germs—all succeeding developments. And the notion that mental propensities in the form of wants and desires are operative in shaping organic structure is likewise coming to the front again. Both these ideas were expressed by Lamarek, who said: "The vital power would produce a continuously graduated scale of development if the modifying influences of the medium were not interfering." And: "Needs produce organs, habits develop and strengthen them." The former idea we

find already by Kant, the latter by Diderot, who maintained that "organs produce needs, and that reciprocally, needs produce organs."

It now devolves upon us to consider carefully the special theories, by means of which Professor Cope and other biologists endeavor to account for this supreme fact of evolution,—the production of advantageous variations.

CORRESPONDENCE.

DR. SAMUEL KNEELAND ON CREMATION.

To the Editors:

BOSTON, MAY, 1887.

Dr. Samuel Kneeland recently read a paper before the Parker Memorial Science Class on "Cremation, and other Methods of Disposing of the Dead," an abstract of which, it is believed, will interest the readers of THE OPEN COURT.

All nations the lecturer said appear to have believed in a life after death, and have, according to their ideas of this after-life, taken what they considered the very best measures to secure to their deceased relatives the enjoyment of a heaven, as far as funeral rites were concerned. Of the four principal modes of mummification, aerial exposure, burning and interment, he spoke at length only of the last two. He described the process of mummification, as practiced by the Egyptians, and exhibited photographs of the recently opened mummy of Rameses II, to show that the natural forces of decay, though long arrested, will at last prevail—perhaps to the great danger of the living. They believed that, after 3,000 years, the dead awoke to immortal life on earth; hence their devices to preserve their bodies. He alluded to the drying processes used by the Guanches, and the exposure by the Parsees of their dead to the beaks of vultures. Before the Christian era both burial and burning were in use, though the latter was the more ancient, it is mentioned by Homer, and was occasionally employed by the early Romans, and also under the Empire, and until Christianity in the fourth century had made burial the rule. Among the Jews burial was the custom, but we find that the bodies of Saul and his sons were recovered after the battle against the Philistines, that they might be burned, as a mark of special honor. In the fourth century, burning fell into disuse, and since this inhumation has been the general custom. Some have pretended that this so-called Christian rite was due largely to the idea that burning would interfere with the final resurrection of the body, and some religious enthusiasts still make this objection. When we reflect that, after all, it is only a more or less rapid oxidation, whether we burn or whether we bury, and that the result is the same, this objection seems frivolous; it certainly cannot be a matter of any theological importance whether this is accomplished by slow and dangerous underground decomposition or by the speedy safe agency of heat; the miracle of re-creation of the body at any future day of judgment would in either case be the same. Said the Bishop of Manchester, England, in 1880, at the dedication of a cemetery: "I hold that the earth was made for the living, not for the dead. No intelligent faith can suppose that any Christian doctrine can be affected by the manner in which, or the time in which, this mortal body crumbles into dust."

It has come now to be a recognized opinion among sanitarians and philanthropists that earth burial is attended with an ever-increasing danger in large populous communities. The abomination of burial in churches, once so common, has long been abolished, except in very exceptional cases, as Nelson and Wellington. He adduced many instances to show how the soil of church-yards

has been raised several feet by the accumulated remains of the dead, and so saturated therewith that the water and the air in their neighborhood were actually poisoned, and the cause of many fatal epidemics. The amount of ground used for cemeteries, which might be occupied for the support of the living, is very great—not less than 4,000 acres in the immediate vicinity of New York city; according to reliable statistics, with the probable increase of population in the next fifty years, there will be 500,000 acres devoted in the United States to earth burial. From this point of view, grave-yards are desecrated rather than consecrated grounds. We cannot hope to have pure air, pure water, or pure soil in the vicinity of grave-yards; the city of Philadelphia is most unfortunately situated in this respect, receiving into the Schuylkill, above the dam, the drainage of not less than 80,000 graves. Hundreds of cases, from Hannibal to the London plague of 1854 could be mentioned to prove the fatal effects of disturbing old cemeteries; the so-called "Roman fever" is due less to the miasmata of the marshes than to the emanations from a soil saturated for centuries by the remains of millions of the dead. Decomposition in the earth resolves the body less into dust than into gases; the former is only four to five pounds of lime salts, the latter escape into the air, or are absorbed by the roots of plants to produce a useless fertility. Man, by his mode of interment, contrives to prolong to the utmost the possibility of poisoning earth, air and water. In the grave of six feet in depth there is no access to the minute creatures which rapidly destroy flesh on or near the surface; the devouring worm is a myth, and chemical decomposition is what occurs; the microbes do their share of the work of putrefaction near the surface and in the early processes. There is, however, a way in which the health of thickly settled communities can be protected against the dangerous emanations from the bodies of those who die in our midst, and at the same time fulfill all religious, sacred, loving and tender duties to them, and that is by burning or "cremation."

Attention was prominently drawn to this process in 1873, at the Vienna Exposition, by the results of scientific cremation exhibited by Professor Brunetti; since then the progress of this reform has been shown by the establishment of many crematories, especially in Italy and Germany, and some half a dozen in this country, by treatises on the subject in all civilized languages, and the springing up of hundreds of societies, one even in Boston; so that this process, at first called barbarous and heathenish, is now recognized by most scientific physicians and thinking men and women, as destined to supersede earth burial in populous communities. It is a process of great scientific skill to reduce the body by the application of intense heat into its elements at once, and without the flame coming into contact with it. The history of cremation in this country is very brief. The first practical movement was in New York in 1874, in 1884 there were two crematories in the United States, both in Pennsylvania; there are now three others which have cremated to the present time about 250 bodies; in England there are three, in Italy twenty, and several in Germany; in Italy at least 500 have been burned, and in Germany, principally in Gotha, more than 250; there are also hundreds of societies and a dormant one in Boston. He described the process as performed in Gotha, Milan, Washington, Pa., and Fresh Pond, L. I.; the oven is a fire-clay retort, of a special shape such as is used in making gas and is heated to 1,500 to 1,750 degrees Fahrenheit. The time required is about one and one-half hours, and the result is between four and five pounds of calcined bones which readily fall into small fragments and ashes; there is neither odor nor smoke, no fuel or flame comes into contact with the body, nor is there any sight or sound to offend the most fastidious. The objection that criminal practices might thus be masked is fully met by the stringent laws by which such corporations are bound, and which would rather prevent or detect murderous deeds.

This would save expense and vain show at funerals, without interfering with any religious ceremonies and also much dangerous exposure at the grave in inclement weather. The expense, both in Europe and this country, is from twenty-five to thirty dollars, not half the cost of an ordinary casket; the aggregate saving in the United States annually by cremation would amount to many million dollars, which sum is not only thrown away, but serves to perpetuate and extend a custom dangerous to the living. Undertakers, at first, would object, but they would soon find some way gracefully to yield, and get comfort and cash out of cremation. Rich and poor would then be served alike, and the equality of the dead—a few handfuls of ashes—would be a verity. The work of years is thus done in an hour—the horrors of the grave are done away with—no robbery and mutilation of the dead can occur. We may have in an urn all that is earthy of our relatives, while the ethereal particles, set free by heat, dwell in the bright sunlight and not in the dark, damp ground. Our prejudices, sympathies and sentiments at first rebel against cremation, but as rational beings we should not allow our emotions to run away with our reason, in a matter so important as this. The living have the best right to live, irrespective of the dead, and to enjoy that immunity from many diseases arising from foul air, impure water and poisoned earth, which they are entitled to receive from the progress of sanitary science. "God's acre" shall then cease to be a plague spot, and the earth shall be the home and the support of *life* and not the bed of *death*. *

GOOD AND BAD.

To the Editors:

Fully appreciating the well-defined merits of what has been said in *THE OPEN COURT* relating to good and evil, I am still impressed that these terms have each a positive and a relative character.

As to good, *in a moral sense*, it must necessarily have a fixed, and invariable standard, in which a vicious will can have no companionship. This attitude alone would represent the positive; and the expression good, in its common usage, as applied to material things, may embrace a countless number of varying states and conditions; and, as a matter of course, would represent the relative.

Now, as to the origin and basis of the positive, speculate as we may can we find its home anywhere outside of the order of nature? It belongs to the fitness of things, to the harmonies of the infinite parts of the inconceivably grand whole as they go their perpetual round, and where else could this fitting in of a sentient factor have been derived? It came as intelligence came; but unlike the slow growth of intelligence through the processes of evolution, it came out of the ages known only to matter and form, to guide intelligence to happiest results, complete and ever unchangeable. We say "it came," etc., in the absence of a conception tending to any other deduction rationally considered; not from the average will of man, surely.

That man is, in a varying and limited sense, endowed with an independent will, no one will deny; and, if we take proper thought, it will readily appear that man unpossessed of this faculty would be far less than what he is, and that the evolution of sense would have been arrested by the default of nature, on the verge of completion. Not a supposable case!

It is religiously expressed or implied, that the Decalogue—the story of its origin not taken into consideration—embraces the sum and substance of all moral law. This is wide of the truth! For example: Are the endless evils which are everywhere arising out of social and political states, in a general way fostered and condoned, less inimical to morality, less chargeable to individual responsibility, than are the offenses named in the Decalogue? If one is constrained to say no; why, then, should the religious world pass them by?

We hold to personal responsibility for departures from moral law by the same rule which effects to govern the decisions of civic courts, viz: the degree of volition, hereditary bias, etc., as we are compelled to regard man, in large part, as a being subjective in the matter of character to his surrounding conditions, and to ancestral impress.

It needs but a few words to illustrate relative good. It is enough to say, that morality is not specially embraced in its application. It can only comprehend that which may give *rational* satisfaction to the individual and the public, in matters public and private.

C. K. D.

THE MONTANA INDUSTRIAL SCHOOL FOR INDIANS.

To the Editors:

BOSTON, MASS., May, 1887.

This school, recently established under the auspices of the American Unitarian Association, in charge of Rev. Henry F. Bond, is now in operation. More than half its present quota of thirty pupils are enrolled, and the rest will doubtless enter as soon as roads in the Crow reservation are passable.

This is what Rev. J. B. Harrison, who has recently visited it, terms "the one lone lorn Indian Mission School of the Unitarian denomination." Now that the Dawes Law in Severalty, and Indian Citizenship Bill is the law of the land, it is incumbent on every friend of the Indian and every good citizen to aid in fitting him for the proper exercise of the rights with which he has been clothed. It is a work that appeals alike to all of the liberal faith, to whatever wing they may belong, and on which we can stand shoulder to shoulder with good men of every denomination and every shade of religious belief. Our appeal in behalf of the Montana school is made only to those of what are called the liberals, simply because the "evangelical" or "orthodox" churches have for years been at large outlay in maintaining Indian schools on the reservations: while we, for reasons which have been already set forth, have been idle. The work has at last been begun, and we ask for it the sympathy and support of all good men or women, who have not already identified themselves with some other Indian educational work. Our earnest and faithful missionaries, Rev. and Mrs. Henry F. Bond, and Miss May Crosby, who have heroically undertaken this pioneer work, should be cheered and encouraged by our sympathy and support. Funds are needed for the more complete equipment of the school, and for the support of the superintendent and his employes. The debt on the building and outfit is about half paid. Fifteen hundred dollars are yet due, for which we ask contributions. Boys' clothing is greatly needed, and gifts of new or worn garments for boys from eight to eighteen years, or of material from which to make them, are asked for. The Crow Indians have never had any missionary or educational work done among them, with the exception of a small government school at the agency. The tribe numbers about 3,500, of whom 800 are children of school age. They are naturally wild and debased, but are docile, and not inclined to intemperance. They are honestly endeavoring to obey the injunctions of their Great Father at Washington, and are selecting their allotments and building houses upon them. The government has sent out farmers to live among them, to show them how to cultivate the ground, how to build houses, and how to live in them in a civilized way. They have always been the friends and allies of the whites, and ready to take up arms against any tribe at war with the United States, even though they were their life-long friends. For this reason they have been hitherto neglected by the missionary bodies, who devoted themselves to the conversion of the tribes from whom the whites had most to fear. This unjust neglect of our steadfast friends should now be put an end to, and every effort should be made to educate and civilize them. It is a work requiring heroic self-sacrifice, zeal, and patience for its successful accomplishment, and the liberal and cordial aid of all its friends.

Shall not our faithful workers have the cheering assurance of our cordial sympathy and support in their great undertaking?

Contributions may be sent to me at No. 25 Beacon st., Boston.

J. F. B. MARSHALL.

THE TOBACCO NUISANCE.

To the Editors:

Just now as I took up THE OPEN COURT of March 17, my eye rested upon an article entitled "The Rights of those who Dislike Tobacco." This is a class to which I belong, and I at once read the article to which I give my hearty indorsement, having recently been a victim to the monstrous selfishness of smokers. The fatigue and annoyances of travel are much lessened by the delightful cars offered to the public for a certain price; but the comfort of both men and women is outraged to a degree not to be tolerated, by the indifference of railroad officials to the unpardonable conduct of men who indulge in smoking without regard to the effect upon others. This annoyance which is distressing enough in the Pullman cars is increased in the Mann Boudoir which by their compartment system offer the much needed seclusion and rest to the weary traveler; the omnipresent smoker because he is hidden from view, either imagines the odor will not penetrate farther than his apartment, or is quite indifferent as to whether it does or not, so that he is unmolested in his enjoyment. The air passes freely through the wicker-fashioned ventilators and is unobstructed in permeating every portion of the car. It dries and parches the throat and nostrils of those who have not rendered insensible the lining membrane of these organs by use of the vile weed, nausea is produced, and the otherwise pleasant journey is rendered miserable. As the writer of the article referred to, very truly says, we pay as much for our seats as the smokers pay for theirs, and we are entitled to the comfort the car affords. There ought not to be a smoking-room in any way connected with the parlor cars or sleepers. The smoking car should be an entirely separate coach, and strict laws ought to be enforced in regard to smoking on the train in any other car than the one provided for that purpose. This is all that any man could ask, for even under this arrangement he pays for one seat and gets two, and the cost of running the smoker must be partly paid by those who have no need of it. Men who smoke ought to suffer whatever discomfort there may be connected with it instead of those who are not addicted to the habit. Last summer during a trip down Lake Champlain something occurred which is in point while on the subject of tobacco. The day was a perfect one in July, a soft breeze stirred the beautiful blue water into ripples; the verdure as we passed along the Vermont shores was illustrative of the name; the mountains in the distance on either side made the scene very picturesque. We seated ourselves on the forward part of the beautiful steamer Vermont, which plies these waters, and a quiet happiness diffused itself over us as we gazed upon the charming landscapes presented to our view, when we were unexpectedly brought to realize that even this ambrosial atmosphere was not without the fumes of tobacco, and the inevitable vile man was also here "where every prospect pleases," for well up toward the bow of the steamer, sat an immense animal, gross and repulsive, smoking a cigar, the wreaths of abominably scented vapor floating back over all seated in that part of the boat, and worse than this on the floor at his side was a large soup-plate into which he injected his surplus saliva until it was half full, a loathsome and nauseating sight. Conduct such as this was to be looked for only in the lowest kind of saloon and yet among respectable refined people he went on with his disgusting programme unchecked by proper authority until he had finished his third cigar, and then stopped not because he was compelled, but because he had satisfied his vitiated desires, in his supreme selfishness not thinking or caring whether others were annoyed

or not. Railroad and navigation companies ought to demand at least decent conduct, that those of their passengers who are well disposed and orderly, may not be annoyed by boors.

In a recent trip South, riding from Chattanooga to Birmingham, Alabama, in a Mann Boudoir car, a lady was subjected to annoyance by the boisterous conduct of a party of politicians from the capital of a prominent State, who were going on an excursion to New Orleans. They smoked and drank until they were merry and noisy, and sang in a roaring tone songs of no very choice selection. Then some of them strolled through the car looking inquisitively into every compartment, after which followed more smoking and drinking and noisy demonstrations, vulgar remarks and generally objectionable conduct, with nobody to interfere, though even the porters were disgusted. True, their smoking and singing were done in the smoking-room, but the fumes and the noise were scarcely less disturbing than if indulged in in any other part of the car.

The parlor car and the sleepers will speedily become no more desirable than the day coach if beastly men are permitted therein to give free rein to their depraved inclinations. In using the word beastly, I do not refer thereby to the conduct of our domestic animals, for they are far less objectionable in their behavior than these men, but I mean an ogre, a frightfully misshapen and hideously featured creature, such as live in the goblin stories of old, for no matter how well dressed these men may be, their selfishness has rendered them moral monsters.

I trust those who are annoyed in traveling by men of base instincts, utterly regardless of good manners, may send in their complaints, until the companies who provide means of conveyance for the public will do something to abate the nuisance, to cause those who are disposed to make others uncomfortable, to refrain through fear of the stringency of the law.

CAROLINE M. EVERHARD.

BOOK REVIEWS.

HISTOIRE RELIGIEUSE DU FEU. *Comte Goblet d'Alviella*. Bibliothèque Gilon: Verviers, 1887. pp. 109.

INTRODUCTION A L'HISTOIRE GÉNÉRALE DES RELIGIONS. *Comte Goblet d'Alviella*. Leroux: Paris, 1887. pp. 185.

The author of these volumes, and also of an extremely interesting account of the movements to liberalize religion now flourishing in the United States, England and India, is at present professor at the University of Brussels. His pamphlet, telling what use has been made of fire in various ages and lands to express and excite devotional feeling, is very valuable as showing not only how much all the religions have in common, but how closely their peculiar differences depend upon the state of human knowledge of natural phenomena. One curious circumstance is the similarity of the name of Prometheus to that of an instrument for producing fire by friction, still in use in India where it is called "pramantha." The various legends that fire was not known upon earth until it was stolen from heaven, certainly justify belief that the first men had to live without it. We are glad to see that these essays have had two editions since their original publication in the *Revue de Belgique*.

The neatly bound volume containing the lectures on the origin and primitive forms of religion delivered by the Professor two years ago, was published just before the discontinuance of *The Index*, in which it could therefore be noticed only briefly and inadequately. The introductory lecture states the theological and other prejudices which make it impossible, as a general thing, for a man to study any religion but his own, and often put it out of the question to study even that. This important part of the

course is printed as delivered, and is supported by an appendix making a very strong plea for introducing the comparative analysis of religions into collegiate education. Perhaps money might as well be spent in endowing lectures thereon in our American universities, as in founding a new one, more strictly in the interest of Free-Thought. Most of the volume is taken up with very suggestive summaries, showing how the primitive men at first worshiped mountains, trees, animals, lightning, fire, the sun, etc., gradually came to adore the souls of the dead, expressed their feelings in various prayers, conjurations and ceremonies, and became subject to priests and sorcerers. Despite the mischief done by these latter, great service was rendered to morality, according to Professor d'Alviella, by these primitive religions. They may have been badly needed in order to repress savage passions and maintain social order, and at all events they were much less intolerant than their famous successors have been, with the single exception of Buddhism. The whole subject of the relations of morality and religion is so important that Count d'Alviella will, it is earnestly hoped, make it a special study, as he takes up one group of religions after another, so that he may combine all his results on this point. It is pleasant to hear that he disposed during the winter of 1885-6 of the Chinese, Mexican and Peruvian religions, that he took up the Egyptians last fall, that next winter will be devoted to Judaism, and that he will pass from the Semitic to the Aryan forms of faith and worship. Everyone who reads the results of his studies already published will welcome eagerly whatever else he may consent to print. Such books deserve peculiar praise from all who advocate "the scientific study of religion."

F. M. H.

LAST EVENING WITH ALLSTON, AND OTHER PAPERS. By *Elizabeth P. Peabody*. Boston: D. Lothrop & Co.

This collection of interesting essays may be regarded as gathered sheaves from a harvest of many years of helpful pursuits, constant intellectual activity and generous aspirations. It has been the special distinction of its author to live a life of high ideals, and to enjoy a large number of friendships and intimacies with men and women of rare intelligence and character. The volume comprises sixteen distinct papers, without counting a poem at the end of the series and an appendix, upon diverse themes; most of them gleaned from various periodicals in which they originally appeared. The earliest date of these productions is 1830. The others follow at irregular intervals during a period which falls but little short of half a century. All of them evince that they have proceeded from a mind of exceptional scholarship and culture, philanthropic spirit and deep moral and religious sensibility. While there are numerous topics touched upon in the course of these essays the leading sentiments which come into play all through them are the artistic, the philanthropic and the religious. The latter especially pervades and influences all the discussions, even those which else would be purely literary. If one looks for the sharp and clear definitions, and logical methods of modern science and inductive reasoning in the volume before us he will be likely to find them wanting, but may be reconciled to the deficiency by the special excellence and interest which it still possesses. It must be conceded that it is notable at least for the indications that appear of a very thorough and varied erudition, a power of copious and delicate expression, extraordinary imagination, tinged somewhat with mysticism, and pure and elevated feeling.

Although the author has long been accustomed to count herself among the liberal and progressive, it is not strange that much of the contents of her book should seem to voice a stage of the advance which is now considerably, if not altogether, superseded. This is but what might be expected in view of the length of time that has intervened since much of it was written. It however,

serves thus as a sort of chronicle of passing events and phases of development, particularly of those of the transcendental transition, which tend, through the influence of later questions and tendencies of thought, to be forgotten.

The first paper, "Last Evening with Allston," from which the volume takes its title in part, is a report of an evening passed in the company of the great artist, near the close of his life, in conversation upon religious themes. This is followed by a paper upon the "Life and Genius of Allston," and also by one upon an exhibition of his paintings. These articles afford a glimpse of Allston's mental character and his work. The next in order to these papers is entitled "A Vision," and is a remarkable piece of imagination writing. "The Dorian Measure" is one of the longest and most scholarly discussions in the book. It is based upon K. O. Müller's *History of the Dorians*, a work whose conclusions are not as readily accepted as they were when it made its appearance. Among the other subjects considered are Language, Primeval Man, Fourierism, Brook Farm or Christ's Idea of Society, A Plea for Froebel's Kindergarten, a branch of elementary intellectual training to which Miss Peabody has long been zealously devoted. These are all treated in a manner that is at once ingenious and suggestive, and with the remaining articles render it a book of exceptional interest among the recent issues of the press.

D. H. C.

ISAURE, AND OTHER POEMS. By *W. Stewart Ross*. London: W. Stewart & Co., 41 Farringdon street, E. C.; pp. 96. Price, 2 shillings.

This new volume by the editor of the *London Secular Review* consists of a score of minor poems in addition to the longer one with which the volume opens, and from which it takes its title. Mr. Ross, as we have before had occasion to say in a notice of his earlier book of poems, *Lays of Romance and Chivalry*, has decided poetic ability, and his muse seems to inspire him with a certain fantastic and weird imagery which may remind his American readers of Edgar A. Poe,—not in its rhythm or subjects, but in its passionate utterances and romantic exaggeration. Love, war and death are the prevailing topics of which he treats, but we think he shows to greater advantage when he leaves these well-worn grooves, as in the philosophic poem, "Reveresco," and that on Robert Burns, which gained the prize offered by the Dumfries Burns' Statue Committee for the best poem to be read at the unveiling of this poet's statue in his own home. From the latter we quote a few specimen lines:

"—The brave man whose fight is fought,
Whose weapon's sheathed, whose banner's furled,
Though still his fire and force of soul
Throb in the veins of half the world,
Australia loves him; India, too,
As though he had but died yestreen;
Columbia knows the Banks O' Doon,
And Afric sings of Bonnie Jean!"

THE latest number (May, 1887) of the *Revue Philosophique*, the editorial management of which is so ably directed by Th. Ribot, contains articles of great value on psychological and other subjects. Its summary is: 1. L'anesthésie Systématisée et la Dissociation des Phénomènes Psychologiques, by *Pierre Janet*. 2. L'intensité des images mentales, by *A. Binet*. 3. The conclusion of an essay: Le Phénoménisme et le Probabilisme dans L'école Platonicienne, by *F. Pierret*. Beside other interesting reading matter contained in this number, Mr. *Beaussire* discusses the instruction of Natural Law given at the *Collège de France*.

The most interesting essay to us is Mr. Binet's on the intensity of mental images. Binet says: "The world of images which everyone of us carries in his brain, has its laws as has the material world which surrounds us. These laws are analogous to the laws of organic matter, for the images are living elements, which are born, are transformed and die."

Mr. Binet limits his essay to the *intensity* of such images. Analogous to physiological processes intensity is accompanied by "a disintegration of a greater quantity of nerve matter and a more considerable production of heat. * * * We must become familiar with the idea that an *image* can pass through the same degrees of intensity as a muscular contraction."

"The quality of *intensity* is generally and practically neglected, for what we search for in images is a quality quite different from and independent of this first quality, viz., *truth*. But truth is nothing without *intensity*. If two arguments are different in strength, the stronger one will conquer whether it be true or false. One does not speak of truth in mechanics. There are only forces which work. It is the same in psychology; all discussion, all deliberation is at the bottom a problem of cinematics. When studying the intensity of images, we study in reality the method on which are based our true and false convictions."

In proving this, Mr. Binet makes an excellent use of the facts of hypnotism, the study of which he has made a speciality. P. C.

MRS. LAMB'S *Magazine of American History* is always brightly tempting in its useful line, but the article in the May number on "The White House and Its Memories," written by the editor and embellished with fine portraits of the ladies that have presided at the Presidential residence,—a strikingly lovely one of Mrs. Grover Cleveland leading the van in the frontispiece, and one of Miss Rose Elizabeth Cleveland finishing the line,—makes that number especially attractive. Among other topics of interest treated we note "Republicanism in Spanish America," by Hon. W. L. Scrags; "The Wabash Country Prior to 1800," by Isaac R. Strouse, and "Canada During the Victorian Era," by J. G. Bourinot.

ADDITIONAL PRESS NOTICES.

It is full of meat, full of good thought and well worth a man's attention, time to read it, and the price of the journal.—*Indiana Saturday Herald*.

The deepest and broadest thinkers are contributors to THE OPEN COURT, published at Chicago. It is undoubtedly the best publication of the kind printed.—*Narragansett Times*, Wakefield, R. I.

We have received a copy of THE OPEN COURT, a semi-monthly paper published in Chicago, by B. F. Underwood and Sara A. Underwood, on ethics and religion upon a scientific basis.—*Knoxville (Pa.) Item*.

It claims to be devoted to the work of establishing "ethics and religion upon a scientific basis." It is ably edited and nicely printed, and the articles are written, in the main, by acknowledged scholars.—*Kansas Blade*.

THE OPEN COURT, a fortnightly journal, just started in Chicago, is the best thing of the kind we have seen. Its articles are well prepared and the mechanical execution is perfect.—*Tri-Weekly Pioneer*, Michigan.

THE OPEN COURT is on our table. It is a fortnightly journal devoted to the work of establishing ethics and religion upon a scientific basis. The journal is exceedingly attractive in form and typography, and the articles able and brilliant.—*The Smelter*, Pittsburgh, Kan.

THE OPEN COURT.—It has a corps of able contributors who present a great variety of liberal thought, some of it bordering upon transcendentalism, but very much of it that is both instructive and entertaining to minds of average capacity.—*Lockport (N. Y.) Daily Union*.

We call attention to the advertisement of THE OPEN COURT, a high class literary and philosophic journal published at Chicago. It is a remarkably brilliant and original paper, and its editors and contributors rank high in the intellectual world.—*The Universe*, San Francisco, Cal.

THE OPEN COURT is the title of a fortnightly journal published in Chicago and "Devoted to the Work of Establishing Ethics and Religion upon a Scientific Basis," rather hard sounding as an undertaking, but really made easy by a simple exemplification of the subjects chosen for discussion.—*Daily Expositor*, Brantford, Ont.

The publication of a most excellent paper called THE OPEN COURT, was recently commenced in Chicago. It is a fortnightly journal, devoted to the work of establishing ethics and religion upon a scientific basis, and is edited by B. F. Underwood, an assurance of itself that the paper is worthy the patronage of educated, thinking people. Among its contributors are Moncure D. Conway, Felix L. Oswald, Rev. M. J. Savage, John Burroughs, Lewis G. Jones and a host of other authors of well-established reputations.—*Sunday Courier*, Greenville, O.

The Open Court.

A FORTNIGHTLY JOURNAL,

DEVOTED TO THE WORK OF ESTABLISHING ETHICS AND RELIGION UPON A SCIENTIFIC BASIS.

VOL. I. No. 9.

CHICAGO, JUNE 9, 1887.

Three Dollars per Year.
Single Copies, 15 cts.

[The readers of THE OPEN COURT will be pleased to know that among the contributions it has obtained from eminent scholars and thinkers, is the series of lectures by Prof. F. Max Müller, given last March at the Royal Institution, London. The publication of these remarkable lectures in this journal, beginning with the present issue, will be completed in six numbers. The first has now appeared in the *Fortnightly Review*, but not many of our readers can yet have read it. The second, on "The Identity of Language and Thought" and the third, on the "Simplicity of Thought," not published nor to be published in England, have been secured exclusively for THE OPEN COURT, in which they will be printed from the author's manuscript. This distinguished philologist believes that language is the history of human thought, and no other man living probably is as competent as he to read this history understandingly, especially those pages which indicate how men reasoned and what they thought during the world's intellectual childhood.]

THE SIMPLICITY OF LANGUAGE.

ONE OF THREE LECTURES ON THE SCIENCE OF THOUGHT DELIVERED AT THE ROYAL INSTITUTION, LONDON, MARCH, 1878.*

BY PROF. F. MAX MÜLLER.

Part I.

* It is more than a quarter of a century since I ventured for the first time (June, 1861), to address the members of the Royal Institution, and I well remember the feeling of fear and trembling that came over me when in this very place I began to deliver my first lecture on the Science of Language, as one of the physical sciences. I was young then, and to find myself face to face with such an audience as this Institution always attracts, was indeed a severe trial. As I looked round to see who was present, I met in one place the keen dark eyes of Faraday, in another the massive face of the Bishop of St. David's, in another the kind and thoughtful features of Frederick Maurice, while I was cheered with a look of recognition and encouragement from dear Stanley. I could mention several more names, "men, take them all in all, we shall not look upon their like again." To address such an audience on a subject that

could never be popular, and without any of those charming experiments which enliven the discourses of most lecturers in this room, was an ordeal indeed. But painful as the ordeal was, I do not regret having passed through it. Many of my most valued friendships date from that time, and though in advocating a new cause and running full tilt against many time-honored prejudices, one cannot always avoid making enemies also, yet I feel that I owe a large debt of gratitude to this Institution, and not to my kind friends only, but likewise to my honest opponents.

It is hardly remembered now that before the time when I boldly claimed a place among the physical sciences for what I called the Science of Language, Comparative Philology was treated only as a kind of appendix to classical scholarship, and that even that place was grudged to it by some of the most eminent students of Greek and Latin. No doubt, the works of Bopp, Grimm, Pott, Benfey, Curtius, Schleicher, had at that time attracted attention in England, and the labors of such scholars as Donaldson, Latham, Garret and others, could well claim a place by their side for originality, honesty of purpose and clearness of sight. But there is a difference between Comparative Philology and what I meant by the Science of Language. Comparative Philology is the means, the Science of Language is the end.

We must begin with a careful analytical and comparative study of languages; we must serve our apprenticeship as phoneticians, etymologists and grammarians, before we can venture to go beyond. In this respect I am as great a pedant as ever, and shall rather continue to be taunted as such than abate one iota from my implicit faith in phonetic laws. What I said years ago in my lectures on the Science of Language, that phonetics must form the foundation of Comparative Philology, and that the laws which determine the changes of vowels and consonants are as unchangeable as the laws which regulate the circulation of our blood, may have been a little exaggerated, but in this respect exaggeration is decidedly better than the smallest concession. I also hold still to another heresy of mine, for which I have been much abused, namely that a knowledge of Sanskrit is a *sine quâ non* for every comparative philologist, whether his special subject be Aryan, Semitic, or Turanian philology. I know it has been the fashion of late to cry

down the importance of Sanskrit, because it does not supply the key to all secrets, and because in some, nay, in many cases, Sanskrit is less primitive than Greek, or Irish, or Gothic. This is a capital lesson to learn, and may, I hope, put an end at last to the false position which Sanskrit still occupies in the eyes of certain scholars, as the fountain head of all Aryan speech. But with all this, Sanskrit will always maintain its preeminence, as affording the best discipline to the student of language; and we have only to compare the works of those who have mastered Sanskrit, and of those who have not, whether they treat of Greek, or Latin, or Armenian, or Albanian, in order to perceive the immense difference between the scholar who sails with a safe compass and the bold adventurer who trusts to the stars.

Comparative Philology is a delightful subject, and the more it is cultivated the more fascinating it becomes, by the very minuteness of the laws and rules which govern its proceedings. There is enough in it to absorb a man's whole mind, enough to occupy a whole life. But for all that, we must not forget that the study of languages has an object beyond itself, a wider purpose, a higher aim.

And what is that higher purpose which the Science of Language is meant to serve? It is to discover the secrets of thought in the labyrinth of language, after the dark chambers of that labyrinth have first been lighted up by the torch of Comparative Philology. If there are any here present who attended my former courses on the Science of Language, delivered in this Institution, they will remember how often I appealed to the philosophers, whether logicians, physiologists, or metaphysicians, inviting them to a study of language which, like the thread of Ariadne, would lead them safely through the intricate passages of the human mind, through which they had been groping their way for so many centuries, without ever meeting the monster which they meant to slay. In my lectures on Comparative Mythology, in particular, I tried to show the irresistible influence which language, in its growth and decay, has exercised on thought, not only in what is commonly called mythology, the stories of gods and heroes, but in every sphere of knowledge, call it religion, philosophy, science, or anything else. We may do what we like, our thoughts are always hide-bound in language, and it is this inevitable phase of thought and language, inevitable in every branch of knowledge, which I meant by Mythology, using that word in a far wider sense than had ever before been assigned to it. In order to make my meaning quite clear, and to provoke, if possible, contradiction, that is independent thought, I called mythology a disease of language, though adding at the same time that it was to be considered as an infantine disease, as a natural crisis through which our intellectual constitution must pass in order to maintain its health and vigor.

Now it is curious that those who expressed their agreement with me that mythology, including metaphysics, might indeed be considered as a disease of language, did not ask themselves what in that case the health of language would mean. Right language is right thought, and right thought is right language; and if we want to understand, not only the disease, but the health also of our thought, that is to say, the whole life of our thought, we can study it nowhere more efficiently than in the pathology of language.

¶ The Science of Language, therefore, was to me at all time but a means to an end—a telescope to watch the heavenly movements of our thoughts, a microscope to discover the primary cells of our concepts. I have waited for many years, hoping that some one better qualified than myself might lay hold of the materials collected by the comparative philologists, and build with them a new system of philosophy. Everything was ready—the ore was there, it had only to be coined. But whether philosophers mistrusted the ore, or whether they preferred to speculate with their time-honored tokens rather than with the genuine metal, certain it is that, with few exceptions, no philosopher by profession has as yet utilized the new facts which the Science of Language has placed at his free disposal.

I know the answer that will be made. The results of the Science of Language, it has often been said, are as yet so unsettled. They vary from year to year, and the best authorities in Germany, France and England, to say nothing of America, differ *toto cælo* from each other on some of the most fundamental principles. Some hold that, like the law of gravitation, the laws which govern the growth and decay of language admit of no exceptions; others hold, on the contrary, that disturbances in the regular courses of words may here, lead to the discovery of an unsuspected Neptune. Dialects, according to some, are the descendants of one uniform language; according to others they are the feeders of the classical languages, and exist not only before a common literary language can be framed, but continue to influence its later development by constant intercommunion. Dialect, in fact, has become the general name for the *centrifugal* tendencies of language, whether originating in individuals, families, villages, towns, or provinces, as opposed to the *centripetal* power of analogy, represented by the sway which, whether for good or for evil, majorities always exercise over minorities. But even on minor points there have been most sanguinary battles between hostile camps of comparative philologists. Whether the original Aryan language possessed one short *a* only, like Sanskrit, or whether the *a* was already, before the separation of the Aryan family, differentiated into *a*, *e*, *o*, has been treated as a matter of life and death; and I do not deny that in the eyes of the true scholar it is a matter of life and death. But it does

not follow that because Curtius hesitated on this point he therefore deserves all the ignominious epithets that have been showered upon his head. Among scholars by profession all this is understood. Curtius holds, and will hold, his place of honor in the history of Comparative Philology in spite of all that has of late been written against him, and no one will be more ready to admit this, I believe, than Brugmann, Osthoff and others, who have attacked him so fiercely. I am sorry for rude and ungracious language at all times, but I do not mind an honest fight. What I object to is, if critics, who are too lazy to form an opinion for themselves, amuse themselves, and think they can amuse others, by collecting a number of passages from the writings of these philological champions, in which they not only contradict each other flatly, but bandy epithets with which they seem but too familiar, whether from the study of slang dictionaries or from their partiality for the customs of primitive savages. Let every man judge for himself, and give his opinion and his reasons for it; but simply to point out that Bopp has been called an *ignoramus* by somebody—it may be even by someone who is somebody—that Sir William Jones has been dubbed a mere pretender, or Darwin a fool, may no doubt serve to raise a smile, and to bring a whole subject into discredit, but it can do no possible good. What province is there in the whole realm of human knowledge in which there is no difference of opinion? None, I should say, except where there is for a time neither life, nor progress, nor discovery. It is because there is at present intense vitality in the comparative study of ancient languages, traditions, customs, mythologies, and religions that there is in it that constant friction, that frequent scintillation, but also that constant increase of new light. Do you think we shall ever have infallibility and immutability in the republic of learning? I hope not, for to my mind that would mean nothing but sluggishness, languor and death. Scholars welcome everybody who in the open tournament of science will take his chance, dealing blows and receiving or parrying blows; but the man who does not fight himself, but simply stands by to jeer and sneer when two good knights have been unseated in breaking a lance in the cause of truth, does nothing but mischief, and might, indeed, find better and worthier employment.

To say, therefore, that the results of Comparative Philology, Ethnology and Mythology are still too uncertain to make it safe for a philosopher to take them into consideration, is mere laziness. The river of knowledge, like all other rivers, will never stop flowing for timid men to pass through with dry feet; it will flow on *in omne volubilis ævum*, and we must take our header into it, and swim or drown.

There is one advantage at least in getting old. To a young man, or I should rather say to a man of middle

age, to see the pendulum swinging from one extreme to the other, to see the views which he learnt with implicit faith from his teacher demolished by men it may be far inferior in knowledge, judgment and character, is often disheartening. But if one is allowed to watch the clock of knowledge for a longer time than is commonly allotted to hardworking students, one feels comforted on seeing the pendulum returning once more to the opposite side, and one finds out that after all there was more to be said for the exploded errors than we imagined thirty years ago.

I say one feels comforted, though others would probably say, "Is, then, our knowledge nothing but a perpetual swing-swing? Must we be content with always oscillating between truth and untruth, and does the flux and reflux of scientific opinion always leave us exactly where we were before?" No; I certainly do not take so desponding a view of our human destiny. On the contrary, I feel convinced that while the pendulum vibrates regularly backwards and forwards, the finger on the dial—to keep to our metaphor—moves onward, slowly but steadily—unless there is something wrong in the wheels within wheels which represent the incessant toil of honest and unselfish workers.

You may of late years have heard a good deal about new views in Comparative Philology. I highly appreciate every one of these new views, but I do not therefore entirely surrender the old views. There has not been a cataclysm, a complete break between the old and the new, as some giddy people want to make out. There has been, as there ought to be, a constant reform, but there has never been a *coup d'état*. Some of the very foundations of our science have had to be re-examined, and have been strengthened by new supports. Some important additions have been made with regard to phonetic laws, and on the whole it has been found that many things which were accepted as beyond doubt, were after all not quite so certain as they seemed at first.

Let us only take one instance. You have probably all heard of what I called *Grimm's Law*, and what, as I fully admit, would more correctly have been called *Grimm's Rule*. However, it may be called at least an Empirical Law, for it contains the observation of a uniformity in the changes of consonants in Low German and High German, as compared with all the other languages of the Aryan family. We find the observation of that uniformity in its crudest form in Rask. It was afterward generalized and more firmly established by Grimm. Still, a number of exceptions remained, and these were gradually diminished by the discovery of new rules by Lottner, Grassmann and Verner. But even now, much remains to be done. There are still exceptions to be accounted for, such as Gothic *fadi*, which as Sanskrit has the accent on the first, ought to be *fathi*; or Gothic *hvathar*, whether, which as Sanskrit *katara*

has the accent on the last, should be *hvaðar*. Nay, I believe that a higher law has yet to be discovered to account for the influence which, according to Verner, the accent immediately *before* Sanskrit tenuis is supposed to exercise. If the accent is on the vowel immediately preceding the tenuis in Sanskrit, the tenuis becomes aspirate in Low German; if not, the Sanskrit tenuis appears in Low German as the corresponding media. Thus Sanskrit *bhrátar* becomes in Gothic *bróthar*, *t* being replaced by *th*; but Sanskrit *pitár* becomes *fadar*; Sanskrit *mátár*, Anglo Saxon *móðor*. Why? Simply because the accent in Sanskrit was immediately before the *t* in *bhrátar*, but not so in *pitár* and *mátár*. This shows how closely languages are held together, a change of accent in Sanskrit being sufficient to explain the change of *th* and *d* in Gothic, Anglo Saxon and other Low German dialects. But we have, as yet, the facts only. Why the accent should exercise this influence we do not know, unless we suppose that the accent before the tenuis draws the tenuis toward the preceding vowel, makes it, as it were, the final of a syllable, and secures to it that aspiration which a tenuis would claim, if the final of a word.*

I wish I could give you to-day a fuller account of the excellent work that has been done during the last twenty years by such men as Lottner, Grassmann, Verner, Ascoli, Fick, Ludwig, Schmidt, Collitz, Brugmann, Osthoff, de Saussure, Schrader, and many others. You would be surprised at the perfection which has been attained in the elaboration of phonetic rules, in the observations on the working of analogy, in the more exact definition of technical terms, and in the historical conclusions to be drawn from the facts supplied by a comparison of cognate languages.

But my object to-day is a different one. I wish to call your attention to the progress that has been made in our comprehension of language itself. Now, whatever views were formerly held about language, everybody was agreed that language was a most wonderful thing, so wonderful, in fact, that perhaps the wisest thing that could be said about it was that it must have been of superhuman or divine origin. It was quite clear that, though men might frame new out of old words, no man could ever frame at his own pleasure a word entirely new. Nor did nature seem to have supplied primitive humanity with a vocabulary, for all vocabularies differed, and every person capable of speaking had to learn his language from his parents. Whence, therefore, could language, with its millions of words, come to us except from a superhuman and supernatural source? We wonder at the infinite number of stars, and we well may. One look at that silent eternal procession is worth all the miracles of all religions put together. But if the

stars on high and the still small voice within seemed to the greatest philosopher the two greatest miracles, might he not have added the galaxy of words as the third great miracle that passes all understanding, though it passes every day before our very eyes? If you consider that the great English dictionary, now being published by the University press at Oxford, is to contain two hundred and fifty thousand words, that is, a quarter of a million, and that on a low average every word admits of at least ten changes by means of declension, conjugation, or degrees of comparison,* you have before you, in English alone, two millions and a half of words, every one a bright star of human thought. I wonder what the number of the stars in Heaven may be. Struve, I am told, formed a guess that their number might amount to two millions! But the visible stars, up to stars of the fifth magnitude, amount to one thousand three hundred and eighty-two only, and I doubt whether anybody here present has ever seen more than twice that number, as I doubt whether many people have ever used more than twice that number of words. At Oxford, as Professor Pritchard informs me, the stars which we see with the naked eye are about two thousand eight hundred—about the same as the number of the members of the University in their various degrees of light and magnitude.

THE RELATION OF THE DOCTRINE OF POPULATION TO SOCIAL REFORM.

PROF. HENRY C. ADAMS.

One is almost ashamed to speak of the doctrine of population, so many have been the errors and misconceptions respecting it; yet it is fundamental to all right thinking upon the ultimate destiny of the human race, and, in consequence, to the consideration of any proposal of social reform. Indeed, it is believed by many to be a system of thought which stands opposed to all reforms, and on that account, also, it should receive the attention of students of social relations.

We shall put ourselves on the right track for interpreting correctly the *Essay on the Principles of Population*, by Robert Malthus, which appeared in 1798, if we notice the story of its writing. It appears that the elder Mr. Malthus was a student of Condorcet, a disciple of Rousseau, and a friend of Godwin. These writers believed the evils of society to arise from the vices of human institutions. Man was not deprived by nature; it was as easy for him to do right as to do wrong; his acts were determined by his surroundings. Could the artificial structure of society be changed, there was no reason in the nature of things why men could not attain a state of perfectability and live forever in comfort and happiness. These writers, it will be observed, were optimistic anarchists. They appealed from

*See Heyne, *Laut und Flexionslehre*, p. 98; also Sweet, *History of English Sounds*, p. 9.

*A Greek verb, according to Curtius, admits of 807 modifications; a Sanskrit verb of 891.

the artificial regulations of the eighteenth century to a law of nature, urging that harmony and happiness must necessarily follow the dethronement of king-made law and the enthronement of natural law. It was this set of teachings which the elder Malthus sought to force upon his son, but the intelligence of the son refused to submit to the vagaries of uncontrolled imagination. Let us assume, said the young man, that society has attained a perfect state of equality in which each has enough to satisfy rational wants, and that what you term the "law of natural liberty" is the only authority; such a happy state cannot last, for it lies written also in this law of nature that the human species will increase up to the limit of subsistence. "In a state of universal physical well-being, this tendency, which in real life is held in check by the difficulty of procuring a subsistence, would operate without restraint. Scarcity would follow the increase of numbers; the leisure would soon cease to exist; the old struggle for life would recommence, and inequality would reign once more."

In judging of the doctrine of population as a system of thought, we should never lose sight of the controversy in which it was formulated. As an answer to the conclusion of those to whom it was addressed the argument was final, for, assuming "natural liberty" to be the only premise of action, a perfected society is an impossibility. The poverty and crime which spring necessarily from the unregulated struggle for individual existence will surely make its appearance; but it is only when the conclusions of the essay are regarded as true independently of the assumptions from which they proceeded, that they throw a false light upon the problem of the ultimate destiny of the race. This was well recognized by Malthus, and when he perceived what use people were likely to make of his doctrine, he modified its premises so as to be more nearly in harmony with the facts of life; that is to say, he admitted the existence of moral restraints upon the increase of numbers, thus taking the entire question out from the domain of natural law and subjecting it to the control of a conscious purpose in society.

This, to my mind, is the most important lesson to be drawn from the doctrine of population when studied in his historical setting. The development of human society is not wholly directed by blind force acting through individuals, but the intelligence of society may be brought to bear so as to direct development toward rational ends.

Let us now return to the thought from which we started. If we brush aside the long and tedious discussion to which the law of population has given rise, we shall see that the true interpretation of Malthuseanism is not that poverty and crime are necessary phenomena in an advancing society, for the theory itself admits that these evils may be set aside by subjecting the natural

laws of production and procreation to the direction of an intelligent will. It does not therefore stand opposed to reform, but declares one of the conditions to which reform, if successful, must adjust itself. Whence, then, it may be asked, arises that contemptuous hatred with which many regard the doctrine? This, I think, comes from the restricted and unwarranted interpretation of the phrase "moral restraints." It has been commonly held that the only restraint to be brought into play was the self-restraint of the poor with regard to marriage, and the only motive which could induce to the exercise of this restraint was the fear of over-stocking the labor market. If the poor will propagate without reason they must take the consequences. Such is the comforting theory of the rich.

But such, I apprehend, is not the necessary conclusion from the premises. Were the poor sufficiently intelligent, or had they the time to become intelligent, so as to clearly see the bearings of great social forces, they might perhaps be held in a degree responsible for the barriers which they erect against the advancement of their own class, although even that would not excuse the well-to-do for perverting the industrial forces from their highest social employment to the ministry of personal luxury. But since the poor lack the intelligence necessary for appreciating the law of social progress, the superior intelligence of society should be brought to bear in directing their thoughts for them. In a certain degree this has been already done, as, for example, in the quite universal establishment of popular education. For it is well recognized that the spread of intelligence renders men sensitive to those influences which threaten race deterioration. Such efforts are commendable, but they are not adequate. The phrase "moral restraints" must be granted an interpretation which shall lead to broader schemes of reform than any yet undertaken before its full meaning may be said to have been apprehended.

It seems, then, that in applying the law of population we must look away from the individual and consider the question as a question of social development, and from this point of view two thoughts make themselves clear. First, it is not the actual numbers of people, but the rapidity of their increase that determines the grade of physical comfort in which men may live. If the proportion of producers to dependents is at any time too large, the tendency will be to lower the standard of living. But at the present time, while the world is passing through the period of industrial advancement which marks the nineteenth century, this thought is of comparatively slight importance. Under present conditions, over population is no explanation of poverty. But in the second place, it is the source from which population comes, rather than the rapidity of its increase, which determines the influence of numbers

upon the character of society. If the men born into the world are of the right sort there is no immediate danger of there being too many of them. How then may the source of increasing numbers be brought under the control of the social judgment? Legislation upon this point has for the most part failed. The restriction of marriages has commonly resulted in an increase of illegitimate births. There seems to be no adequate answer to this question, except the one which recognizes that all men are open to the influence of the same motives, and which seeks to adjust society in such a manner that these motives may produce their normal results. Upon whom do the moral restraints respecting population now work? Manifestly upon those who are born sufficiently high in the social scale to appreciate the allurements of hope. Who, on the other hand, are wholly careless as to the consequences of marriage? The answer is equally plain. It is they who have nothing to hope for in the world as they find it, and who are too weak to hew for themselves a path to success. This matter of hopefulness is in part a matter of temperament, but its development is largely a matter of circumstances. Of one fact we may rest assured, and that is that hope will never spring up where the door of opportunity is closed. It is not enough that the law grants men a legal right to better their circumstances if they are able; the conditions of success must be adjusted to the ability of all men, the weak as well as the strong, or the restraining influence of hope can never save us from an increase in numbers of the worst sort.

The conclusion of this somewhat rambling discussion is this. The doctrine of population, properly understood, does not stand in the way of rational reform, for the question of population will cease to be a matter of embarrassment in any society where men can easily attain and maintain a reasonably high grade of social enjoyment.

"MIND-READING, ETC.:" A REPLY TO M. J. SAVAGE.

BY J. S. ELLIS.

In your issue of April 28, appears an article by Minot J. Savage, on the above subject, the "etc." being brought out very conspicuously. The article is a very characteristic one, and I think it only fair to your readers that some criticism of it be allowed. The letter is characteristic in these points:

1. The claim that there are proven facts which are denied admittance into scientific theories. The claim seems to be, that because there are some things which cannot at present be explained, therefore we ought to believe the specialties put forward.

2. The demand that investigators should be believers.

3. The statement that, when once a general truth has been established in a man's mind, he does not require so much evidence to support a special case.

4. The total absence of any facts bearing on the subject; accompanied by the acknowledgement that Mr. Savage is "not ready to publish more than hints or fragments of facts" which have led him to the certainty he expresses.

"Psychic Research" has certainly labored for many years under special disadvantages. Although favored by the support of a few scientific men, it has been tabooed by the great majority. But its most conspicuous disadvantage has been the support of its "friends," the professional mediums. There can be no doubt that these persons have brought more discredit upon all forms of spiritualism, by the exposures which their exhibitions have entailed, than would have been inflicted by any amount of respectable opposition. But surely, after so many years of experiments and investigation, some facts rather than mere "hints and fragments" should be forthcoming. Men of sense demand, not "experiments," that to-day may be successful, but may fail to-morrow, even when all preliminaries are arranged apparently satisfactorily; but facts, the exhibition of which can be arranged and carried out with scientific certainty, openly, and with every precaution against fraud. For it is not enough that certain results should be exhibited and the spectators be forced to admit the statements of the exhibitors as to preliminaries. What is required is, that the whole of the preliminaries and accompanying circumstances should be perfectly exposed as in all really scientific investigations, and that the results should be capable of being repeated in similar circumstances. Until this is done, we are bound to treat the pretensions of all "mediums" as at least not sufficiently sustained to justify us in classing these pretenders among scientific investigators. It is this slight spice of talk about science which induces me to write this letter; for I find that, not only does it mislead a large number of persons who make no claim to scientific knowledge or methods of thought; but it actually induces some otherwise clear-headed thinkers to admit as possibilities, facts or supposed facts which their mature judgment would cause them to utterly repudiate did they approach the matter in the logical and scientific frame of mind with which they attack other problems.

The first claim is that there are "facts" which find no place in scientific theories. This is followed by a statement that thousands of sane persons assert that wonderful psychic facts are of "daily occurrence;" and is preceded by an acknowledgment that the writer is "not ready to publish more than hints or fragments of facts." After such an admission, it is not surprising that the only "facts" mentioned are that certain mediums have "told things" which they "could not have known." The reason this sort of rubbish is not admitted into scientific theories is plain to those of us who are unbelievers. If a chemist desires to exhibit the composition

of salt, he takes a sample from any cupboard or shop where he can find it. Allowing for impurity, the result of his experiment is the same. If the Psychic Force man wants to prove his "facts," he can only do so by getting certain "mediums" who are experienced in the business to perform the "experiments." Let Mr. Savage tell me some of the "strange powers" which have been exercised in his study, so that I can call them forth in my study, and I will do my best to assist in their establishment on a scientific basis. I certainly have often longed for the assistance of some force which would enable me to "move physical objects without muscular pressure." Vain wish, alas!

But why should investigators be believers? Scientific men do not care whether investigators are believers or not. They know perfectly well that investigation will turn unbelievers into believers, and give them knowledge in place of prejudice. It is true, that a man who believes in the truth he is seeking and knows the direction in which to investigate, is more likely to be successful in finding it than another with less belief and less knowledge. But if an ignorant unbeliever asks a scientific man for information, the scientist will give him the means of gaining the knowledge he requires, and not throw his letter into the waste basket, as Mr. Savage suggests.

The third claim might be paraphrased thus: "When once a man has persuaded himself that his particular nostrum is the truth, he will receive and promulgate any number of 'cases' supporting it that may be reported without any particular inquiry into their reality." That this is no exaggeration is shown by the acknowledgment that, in regard to the alleged proof of the existence of thought-transference, Mr. Savage's "acceptance is based not so much on the evidence offered, as on the fact that I am sure things quite as wonderful have occurred in my own experience." Is there any scientific theory into which this sort of thing can be made to fit? Mr. Savage says the present condition of affairs (that is, the non-acceptance of these alleged "facts" by scientists) is "a scandal both to science and philosophy." If there is any scandal, it would appear to me to rest on the shoulders of men who are putting forward notions so opposed to all true science, that the utmost that can be said in their favor is that they "need explanation;" the very facts on which they are based requiring substantiation. Until some substantial facts are put forward—facts which can be demonstrated by all inquirers, and not by a few specialists who make it their hobby—I think we are fairly entitled to relegate all this business to the domain of the mountebank and the charlatan.

The real value of evidence seems to be a point on which, too, spiritualists have very indefinite notions. They seem to think that all that is necessary is, that a few people at a seance should be forced to acknowledge

that they have seen something which they cannot explain, to give them fair ground for asking us to believe their explanation to be true. Even if we could not explain some of these things, if we knew all the circumstances, the evidence of even ten thousand eye-witnesses would be of no value, if it could be shown that they were wanting in sufficient accurate knowledge to make them competent judges. What would be the value of the evidence of a few millions of Africans as to the cause of an eclipse or a rainbow? The only things which are hinted at in the article are those which, if true, certainly would seem to partake of the miraculous, or something equally reasonable. If a friend of mine were to tell me something which I knew he could not possibly have known, I think my answer would be short if not flattering. And I can easily understand why so much has been written on this matter without even the first step having been taken toward placing it on a scientific basis.

CHATS WITH A CHIMPANZEE.

BY MONCURE D. CONWAY.

Part IV.

When I next visited my chimpanzee he said that we would have to postpone our further discussion because a rite of especial importance was about to be performed there by the Brahmans, and no stranger could be present. I expressed my sorrow at this, and my regret that I could not witness more of these secret solemnities.

"If you are sufficiently arboreal to climb with me yon tree," said the chimpanzee, "and to hide behind its larger branch and risk a small fine and large noise on possible discovery, you can witness what is done; it is mainly singing and dancing."

I was soon up the tree and seated on a limb jutting from the large branch. My monkey friend perched just in front of me on the more exposed side. Thus he not only helped to conceal me but was close enough to answer in a whisper any question I might to put. Presently a sedan-shrine was borne into the court; I caught only a glimpse of its deity, who seemed to have a monkey's face, but of this I was not certain, its back being toward me. After priests had prostrated themselves flat before it, and some cakes been laid on small stands, a number of men entered and knelt each to a priest, who covered the bowed head with his skirt. It appeared to be a process of confession and absolution. Then seven men entered, each bearing a musical instrument, and squatted on the stone floor. An equal number of temple dancers followed, and, having removed an upper garment bowed before the deity till their foreheads touched the ground. The movement and expression were those of absolute submission and helplessness. Then the musicians began their singing, with instrumental accompaniment, the dancers remaining motionless.

The "music" was a monotonous thrum-thrum and twang-twang; the singing was a prolonged whine in unison.

"How does that music impress you?" asked my sage when the first performance was over.

"I should hardly call it music," I answered softly. "It sounds like mere whining and whimpering, and is not beautiful."

"Perhaps you do not understand it. Now that they are about to sing again, I will get closer to you and translate every word."

This time the strain profoundly impressed me. It told of the hardness and weariness of life; the sentence of death under which each is born; the partings, the heartbreaks; the wonder whether the world were sport of demons or a hell for punishing sins of previous existence; the consuming famine was described, the drying up of streams, the ghouls of disease, the misery of existence. The tones in which these burdens were conveyed were as perfectly adapted to the sense as the moaning of a wounded animal, the sigh of bereaved hearts, the bleating of sheep whose lambs are slain, the cooing of lonely doves. As I listened my eyes filled with tears.

"You weep, my friend," said the chimpanzee. "For that this music exists. It was not meant to please the ear but to move the heart. It is developed out of the piteous supplications of mendicants. It is meant to move the hearts of gods and goddesses as it has moved yours."

Tinkle, tinkle! The dancers arose and went through their strange evolutions. These too, were not aiming at beauty, as I presently understood. They pleaded before their god with movements. One girl described the passion of that god; how he had seen his ideal become actual in a female form, pursued her, and become the father of heroes. When she had acted the divine legend, another told in her dance how mortals too kindle with love, which, unsatisfied, must consume them. Now clasping her hands, now pressing them to her throbbing temples, she portrayed every phase of passion till at last she sank, a picture of death, with hands folded on her breast. Then forth sprang a third, and, while the instrumentalist beat a happier measure, she danced the joy of happy love, of embraces, of paradise; without, however, any effort to be graceful or fascinating.

"But even this joy is sung in sad minors," I said, "and the dancer's face does not smile."

"No," said my friend, "for her every step is amid fearful perils."

The tired players and dancers now departed. In a few moments the courtyard was entirely vacant, save for the slumberous monkeys. In a few moments we were comfortably seated there.

"What you have just witnessed," said the chimpanzee, "is a fit overture to what I have to say about the evolution of our race through speech. You have heard

music and songs, and seen dances, exactly as they were heard and seen in the beginnings of time. Music and dancing, their original purpose being lost, have been elsewhere developed into arts of human pleasure; but, as in their origin they involved the favor or disfavor of deities, were matters of life and death, even so is it with our temple singers and dancers. Each is trained in the belief that a slightest mistake in accent or motion will bring him or her an eternity of torment. They are a select caste, and feel themselves in the employment of gods and goddesses who will not forgive the least admixture of error in their ceremonies, nor the slightest attempt to please mere mortals.

"A curious state of mind," I said.

"Yes, but like other natural curiosities, developed by simple forces. Have you not known people in your country who believe absurdities?"

"Many."

"They were created by the absurdities they believe; that is, such beliefs must have been for a long time conditions of comfortable existence and family development. For these choirs of the temple the dependence of actual life and death on their exact performances has gradually projected itself into a superstition of the divine and eternal interests dependent on their every motion, accent, tone, word. From this it is an easy step to personification of the spoken word: as Fate, Fairy (*fatum*, the thing spoken; *fari*, to speak).

"All that line of mental development," I said, "has in the West culminated in a dogma that the word of God is a distinct Person, embodying creative power, and that it once appeared on earth in human form and dwelt among men."

"Through such fables" said my sage, "runs a thread of truth connecting us with a period when the spoken word was really vital. The word was coinage of a need; it came hard and was never spoken or written in vain. To tamper with a word might mislead a tribe to its destruction. A warning of pickets inscribed on a rock, in signs agreed on, if altered might lead their fellows to disaster. This, however, is but a smallest illustration of the importance of the word as a factor of evolution. Your physiologists find the natural bridge between mere vocal sound and articulate speech too infinitesimal for measurement. Among us there was always a dispute as to how nature passed that minute point where vocal chords were able to articulate. Some said it was by a bit of luck; others maintained that it was the evolutionary culmination of the animal sounds repeated in the hissing, braying, cooing of the human infant; but all agreed on what was really effected by the acquisition of speech. The anthropoid race from which you and I are descended was a race of howlers. They howled when they were happy, and when they were unhappy; their community was organization of a howl. But one of them managed to cut up

his howl into bits, making it a chatter; this he used when he was satisfied, reserving his howl for distress. The result was that whenever that anthropoid's individual howl was heard all the rest knew it must be trouble, and hastened to his aid. The possession of this superior vocal power by reflex action took its place in that anthropoid's consciousness; he became alive to sounds inaudible to others. Once, hearing a howl more piercing than usual, he hurried to its utterer, and rescued from a serpent a female of the community. From the marriage of this chatterer with a wife able to make her howl expressive, sprang a family of anthropoid genius. Instead of the old monotonous howl these had various expressions—a whine when ill, a sharp cry for a serpent's approach, a growl when it was a wolf, a bark for something else. These sounds multiplied their sources of security. The anthropoids which could not acquire such vocal variability got the worst of things, the others the best. These formed an anthropoid aristocracy; all who were able cultivated some vocal variation which enabled them to marry into this aristocracy, in which all advantages were steadily accumulated. And while these were becoming the sum of every creature's best, *pari passu* the mere howlers were pauperized, denuded of their best individuals and deteriorated. There was interbreeding of ignorance and incapacity on one side by which anthropoids were turned into apes, while interbreeding of superiorities on the other was evolving anthropoids into men. You have only to suppose the selecting process to go on long enough,—millions of years going to acquire one further note of expression,—to realize that these minute variations must at last end for the progressives the cycle of the howl, and initiate the cycle of the spoken word. If a grain of sand be deposited annually on one spot, the process need only be continued long enough for a mountain to stand there. I have said 'word,' but at first it might be merest root of a word; yet roots grow, and spread in branches, for each variety of expression corresponded to a variety of experience. An anthropoid parent, dying by a serpent's bite, might inform his fellows that the serpent is deadly; they can turn his experience to wisdom without undergoing it. Oral traditions, representing an accumulation of facts and experiences, became to those who could remember them as a catalogue of the chief dangers and opportunities incidental to anthropoid life. This was a principle of selection. The community of chatterers advanced to be a social organism of the spoken word.

"Successive changes in one organ drew after them modifications of our whole animal constitution. Increased communication led to co-operation, followed by increased comfort, means, and so much liberation of intelligence from concentration on the momentary needs. These led on to the great transformation. This came when these stored up experiences, preserving most those

most impressed by them, so developing memory, finally relieved the race from bondage to want enough to admit intervals of leisure. Then was developed, out of memory and freedom, the power to compare traditions, select those that confirmed each other, and so gain some notion of classified events—or laws. For this began the work of purposed selection,—like that which in the hands of man has changed the rude stocks of nature into fruits and cattle. Mankind changed pine cones to pine-apples by mere instruction of interest, long before any evolutionary method in nature was recognized. That method which surrounds man with a civilized world of his own creation is not now applied by man to his own breeding. Conventionalism sanctioned by dogma forbids that. But there was no such arresting power over the forms preceding man. Between the animals which express themselves by gesture and cries, and the first talker, came no emaciating skepticism, no supernatural extortioner demanding half their food for sacrifice. They were able to make the most and best of themselves; consequently it were no more miraculous that they should develop themselves into man, if they saw fit, than that man, unrestricted by dogma, working freely, should change a wild briar into a rose."

At this moment the daughter of the chimpanzee approached. He placed his finger on his mouth, winked, gave me to understand that he did not wish to be suspected of speech, and waved me a silent farewell.

PROTESTANTISM AND THE NEW ETHICS.

BY WILLIAM CLARKE.

On the afternoon of the last Sunday in February, I stood amid a vast crowd composed mainly of working people near the portico of St. Paul's Cathedral in London. It was the day of the so-called "Church Parade" of the unemployed people of London, who intended by this means to attract the attention of the wealthy classes to their condition. I think I never felt so deeply what an utter farce the church had become in England. And by this word church I do not refer to the Catholic church, which is popular and sympathetic to the poor (however absurd its alleged miracles and pretended infallibility may be), but to the Protestant section of the Christian church, especially as established and endowed in England. Here were masses of poor people from every part of London to the number of twenty or thirty thousand, rough and ill-clothed, but for the most part quiet and orderly, who were come to show themselves in what is supposed to be their own church. This great church was specially guarded by over 3,000 policemen (called to protect the Lord Mayor and his wealthy friends against their humbler "brethren") although it is actually dedicated to a man who worked with his own hands for a living and taught his fellow-believers to do the same. If Paul could have foreseen

the time when a cathedral bearing his name should be erected in the greatest mammon-worshipping center in the world, and should be usually attended by mammon's chief votaries and that the poor to whom in his day "the gospel was preached," should only have been admitted to his temple on condition of 3,000 guardians of "law and order" looking after them, what, I wonder, would he have said? What a theme the presence of these unemployed might have furnished for a really inspired preacher with a genuine human gospel!—a gospel of salvation from the real evils of life, and not from any sham hell beyond the grave. What an opportunity for a Wycliffe or a Savonarola! But alas, no inspired man filled St. Paul's pulpit; only a well-meaning man, with no gospel worth having or worth listening to. "The rich and the poor meet together; the Lord is the maker of them all"—that was his text. And then we had the usual time-honored platitudes as to God intending that there should be divisions and classes in society; how rich as well as poor had their troubles, and how the rich were to remember the poor and give them presents, and how celestial pearl and gold was going to compensate for the absence of terrestrial cash. The preacher was evidently a kindly person who did really pity the condition of many of his hearers, but I could not help thinking of Emerson's words, "good nature is plentiful enough, but we want justice with heart of steel to fight down the proud."

When the service was over the revolutionary leaders stacked their red flags round the poor old dilapidated statue of Queen Anne in front of the cathedral, a procession was formed and with flags flying and bands playing, the unemployed marched to the embankment where a second discourse was preached of a very different nature from that inside St. Paul's. I followed after, and having learned from one or two of the socialist leaders what they thought of their experiment, I proceeded to meditate on the complete failure of the church to touch the vital issues of to-day, and I thought very much as follows:

The Protestant churches of Christendom are all vitiated by three radical defects. In the first place they are the outcome of the individualist movement of the reformation which, having spent itself, is now well-nigh exhausted. The individualism which in the reformation, the Puritan revolution and the French revolution, was necessary as a destructive agency to be applied to the old dungeon-house of feudalism, where men were stifled for want of thought and capacity for expansion, which was essential for purposes of discovery and invention, and, consequently, for the immense impetus given to material production—this individualism which we associate with such names as Luther, Cromwell, Voltaire and Franklin, has discharged, in the main, its task, has nearly exhausted its possibilities of good and is now

showing its evil side and developing its latent contradictions. Necessary as a protest against tyranny, mere individualism is powerless to build up any great human society into which the men of the future shall be as truly incorporated as men in Western Europe a thousand years ago were incorporated into the mediæval empire and the mediæval church. And individualists are satisfied that this should be so. It realizes their idea of "freedom." Herbert Spencer and Auberon Herbert, the English apostles of individualism, actually liken men to a pile of cannon-balls. Each unit quite distinct and separate from the other. Each unit is to be "free" to do exactly as he like, provided he leaves his fellow-units alone. This is supposed to be the final consummation of human progress; it is really the entering wedge of social anarchy, leaving the cash-nexus as the only bond of human relationship. The true social doctrine is the organic unity of society, in the absence of which no individual can possibly develop his life. To be relieved of social pressure and the social claims of every human being is not to achieve "freedom," it is simply to negate individuality in the truest, highest sense of that word; it is a retrograde movement, and it really provides at this hour whatever intellectual basis there may be for conservatism in England. As an outcome of this great individualist movement (contained in germ in Christianity, but fully developed by the reformation and subsequent events) we find the Protestant churches, particularly those of English-speaking countries, for in continental Europe ordinary Protestantism does not count as a living force.

Now this Protestantism becomes evidently more and more opposed every day to the new social ideal which is felt, not only by revolutionists, but by nearly all of the progressive spirits of our time. That ideal is, I think, a harmonious social order in which there shall be equality of opportunity. The cry of Browning in "Paracelsus" will be the cry of the social reformer: "Make no more giants, God, but elevate the race at once!" It is the general elevation of all, not the dazzling eminence of a few powerful or gifted persons, that the great social forces will now aim at producing. How can ordinary Protestantism help in this work? Its churches are devoted to setting forth aims wholly different. The general mass of mankind are regarded by it as "children of wrath" from whom a remnant are graciously to be selected by some mysterious process. Thus the ordinary Protestant doctrine is fundamentally aristocratic, denying practically the unity of mankind (the very corner-stone of the new ethics) and declaring a doctrine of divine favoritism. The man of the world who has imbibed Protestantism on its material side, declares with Fitzjames Stephen, its most brutal exponent, that this world is made for hard practical people, who know what they want and mean to get it. In other words he

applies the entirely non-ethical principles of Darwinism—the struggle for existence and survival of the fittest—to society. On the other hand the ordinary religious Protestant maintains a celestial favoritism, the palm-branches and golden streets for the “elect” and the chains and red-hot furnaces for the masses of mankind. On neither basis can any ethical social doctrine be founded.

In the next place Protestantism is allied to wealth and to social power. In most of the churches in England to-day neither Jesus nor any of his disciples (whose unreal images are painted on the windows) would be shown into a pew, and the chances are that they would be warned off the premises. These churches, in not a few cases, exist for the purpose of providing liberal doses of soothing syrup to the well-to-do classes, whose nice susceptibilities are outraged by the ragged garments of the poor. Now as Jesus denounced the respectable classes of his day (on the whole as decent a set of people as our millionaires, legislators, lawyers, etc.) as “serpents” and as “a generation of vipers,” and as fit subjects for “damnation,” there is little doubt that if he were with us to-day his condemnation of our organized religion would be little, if at all, less severe. For his spirit is not the spirit of modern Protestantism. To the poor the gospel is not preached. They are, on the contrary, lectured by wealthy archbishops on their want of “thrift,” and by gluttonous aldermen, who drink champagne out of big tumblers, on their “intemperance.”

Thirdly. The church still believes in “other-worldliness,” and regards the bad social state which obtains as having been ordained by God for the spiritual discipline of his “children.” If any human father were to treat his own child in the way that God is asserted by the church to treat the majority of the human race in this world (to say nothing of the lake of fire provided in the next), I think we should all contend for the honor of lynching him. This view of the world taken by the church may be right or wrong, but it is obvious that nobody holding any such view can solve our social problems. For if the church view is right then the social problem is insoluble, and we must wait with as much patience as we can command for the burning up of such a disreputable planet. And if the church view is wrong, then the church stands condemned as incapable of dealing with the tremendous facts of modern life. The new ethical movement, of course, regards the church view as utterly false. It declares on the contrary that we can make of human society pretty much what we like, that for every wrong there is a remedy, and that poverty and crime are no more “inevitable” than was chattel slavery or mediæval serfdom. Leaving, therefore, the clergy of the church to seek in the sepulcher for the redeemer in whom they only half believe,

the new movement would, as Emerson says, “descend as a redeemer into nature” and make here a new earth for a renovated humanity.

TWENTIETH ANNUAL CONVENTION OF THE FREE RELIGIOUS ASSOCIATION.

BY F. M. HOLLAND.

The president of this body has told in *THE OPEN COURT* how it was organized twenty years ago, “on the basis of free thought,” and in order “to make a fellowship, not a party, to promote the scientific study of religious truth,” and “to keep open the lines of spiritual freedom.” This good work, though still necessary, has been so far accomplished during the last few years, as to stand much less in need of organized effort now than it did in 1867. Thus the F. R. A. has been obliged to take up, at its annual meeting, in Tremont Temple, Boston, May 26 and 27, the questions what it is to do hereafter, and why it is to keep itself before the world.

At the opening business session, on Thursday evening, May 26, with the original president, O. B. Frothingham, now vice-president, in the chair, a resolution was presented by the president for the current year, Wm. J. Potter, and adopted, to the effect that the executive committee shall make it their special work to correspond with their fellow-members on the question whether a reconstruction is necessary, and shall report thereon at the annual meeting in 1888. This resolution was read the next morning at the opening of the convention by Mr. Potter, who also presented a plan for enlarging the association into four allied groups, of which one should make religion and philosophy its special subjects, another study problems of natural science, the third take sociology, especially the diminution of vice, poverty, disease and crime, for its field, and the fourth devote itself to amelioration of Sunday laws, taxation of churches, and other branches of State secularization. Each section should have its own officers, and all be represented in the general government as well as in the annual meetings. Mr. Potter acknowledged that this plan is impracticable with the present limited membership. For such work, many broad scholars, eminent scientists and intelligent philanthropists must be brought together; and if such gains cannot be made under the present constitution, then perish the organization. Long live the idea, the real king!

The next speaker on Friday morning, Mr. A. W. Stevens, invited by request of the executive committee, advised the association not to call itself Religious; because religion, as expounded and defined on its platform, is only a calm and cold philosophy. The F. R. A. ought to suit its religion to people’s wants, or drop its name. He had no interest in any being but man, and no desire to solve any problems but those of this life. It

is these practical problems which the F. R. A. ought to make prominent, and to do so with success it should lay less stress on freedom and more on respect for scientific thought, and for the rights of society. This essay was so interesting that I should be glad to see it all in print, especially as Mr. Stevens showed such unusual regard for the rights of his neighbors on the platform as to stop at the exact end of his allotted half-hour, and, of his own accord, leave a number of his carefully prepared pages unread. This sort of honesty is so rare, even in liberal gatherings, that I was glad to see it repeated that afternoon by Captain Adams. Among the last passages read by Mr. Stevens was one proving that the anarchists condemned at Chicago were in reality usurpers. Rev. M. J. Savage then spoke of progress among Unitarians, as well as of the importance of religion. Mr. W. M. Salter, speaking on the supremacy of ethics, said he believed that when all else that the religious world holds dear falls or becomes uncertain, confidence in duty may remain unshaken. Religion so far as it has not been the outgrowth of the moral sentiment has been an expensive luxury to the race, and has come nigh to being a curse. Yet the moral sentiment as naturally blossoms into a religious faith as the buds of spring into leaf or flower. We cannot worship nature or the sum of nature's powers. Without morality and the infinite suggestions it makes, worship cannot find an object, and the word adorable would have to pass out of literature. The moral sentiment gives power. What ought to be, can be. The heart of the world is sound and would we but give way to it, the face of society would be as fair as is now the face of nature. The moral sentiment breeds a great hope. Our current doctrine of immortality has no moral fibre in it. The only reason for supposing there is another life is in case there are those who are worthy of it. Now no drivelling saint nor damnable sinner but imagines he or she is going to live again and live forever. There never was such effrontery.

It is in this society, or in such an association as is proposed by Mr. Potter, that the star of Bethlehem is to re-appear, according to Mr. M. D. Conway. Christian morality is based on the dogma of a speedy millennium, and therefore utterly impracticable. So is socialism. What is wanted is an association to advance ethical truth by scientific methods. Professor Davidson, who was not called upon until the session had proved too long for most of the reporters, while approving of the new plan, thought that what had been lacking was not a statement of aims but one of definite methods. The F. R. A. is too much like a Free Communication Association, which should hold conventions year after year, to talk up the general advantage of having more railroads, steamboats and telegraph lines, but should never suggest any practical method of getting them. No

wonder it drags and seems but half alive. It is high time to re-organize with different and practical methods, with a more definite aim, and in harmony with science, not faith.

This subject also came up with other topics, not only at the afternoon convention, but at the evening festival. Both Captain Adams and Mrs. Cheney agreed essentially with Mr. Potter. Mr. Frothingham appeared satisfied with what was done by the F. R. A. in supplying a free platform for speakers of all religions and no religion; so did Col. Higginson, who spoke of the convention and festival as the best ever given by the F. R. A., though he thought too much time had been spent on definitions of religion, an old habit not likely, I fear, to cease until some such name is taken as that of Progressive Association, proposed by Captain Adams.

The last gentleman, in speaking at 3 P. M., on Sunday amusements, said that those who say God wants to have us keep Sunday, ought to prove that he makes the cows give twice as much milk as usual Saturdays, and lets it keep until Monday, as well as that he takes more pleasure in a jangle of church bells than in a good concert. Then Judge Putnam showed, in a speech which called out much laughter and applause, that the Sunday law is not enforced, for it does not really make our behavior different from what it would be without it, except in so far as it permits rascals to refuse to pay notes signed on that day, or bills for goods then purchased. Mr. Wm. L. Garrison thought God had rather look at parks full of games than at gaudy churches, and that our Sunday was kept much more for the benefit of the rich than of the poor; and Rev. Charles Voysey, of London, sent a letter pleading for more "opportunities of innocent pleasure and games" on Sunday as a preservation from vice.

The festival was a great success, with its bright, cordial speeches, its tables lined with happy faces, its profusion of wild flowers, and its highly artistic music, due especially to a family where *THE OPEN COURT* is always welcome. A large number of copies of this journal was sent to the convention by its editors, and gratefully received by the audience, some of whom will extend the distribution as far as Texas. The executive committee, in their report soon to be published in a pamphlet, with the official account of the proceedings, tells how this journal was founded by "a gentleman in the West as generous in hand as he is liberal of thought," and also say: "We cordially congratulate our fellow-members of this association on the fact that so generously founded and promising a publication has arisen, outside of the association, to work for similar objects to those of *The Index*; and we think it will be generally agreed that *THE OPEN COURT* has thus far manifested a purpose, character and ability, which make it an honor alike to its founder and to its editors." I, too, rejoice

to see the same free platform which the F. R. A. sets up for a day or two, once or twice a year, kept standing, with all its height and breadth and purity, all the year round in THE OPEN COURT.

COMMON CONSENT AND THE FUTURE LIFE.

BY RICHARD A. PROCTOR.

In my article on "Herbert Spencer as a Thinker," I touched on the question of the immortality of the soul, or rather on the question of a future life, as viewed by him, and also—in a note—on the argument from general consent, which has ever been regarded by the unthinking many as of itself sufficing to prove that the soul of man is immortal. I propose now to remark more fully on the futility of the argument from common consent, associating it with the subject of the immortality of individual life.

It is a familiar problem in probabilities to determine how far a report may be trusted when it is received from such and such persons, whose veracity is regarded as respectively so and so. It is vouched for, let us say, by A, who tells truth five times in six, and by B who tells truth seven times in eleven; while it is contradicted by Y and Z, who tell the truth respectively only once in three times and once in five times; what is the likelihood of its truth, assuming its antecedent probability to be one in ten? I do not say that problems of this type are very useful; for the measures of veracity are not such as we recognize in the actual world. Such problems may be compared to those mechanical ones which are given in college examination papers, where we read of perfectly rigid rods, perfectly uniform substances, frictionless surfaces, and the like: in one case which I can remember (since I was one of the victims of the problem), we were invited to deal with a man whose perfectly smooth spherical head was surmounted by a conical hat of infinite height! But such problems may indicate true principles; and in cases where we can form a fair general idea of the likelihood of a certain conclusion being right so far as each of several points of evidence is concerned, we may infer also, in a general way, the likelihood of its being right when all those several points are considered together.

Now, imagine a community of a thousand persons, each one of whom is invited to decide on some one question of considerable difficulty; and let us suppose that the chance of each one giving the right decision may be averaged at one in ten. When all the results are collected together, it appears, let us say, that an immense majority agree in giving one answer, the rest giving either a different answer or declining to answer at all, on the ground that the question is too difficult for them to decide. Unquestionably in such a case as this, the opinion of most persons (common consent again) would be that the decision of the bulk of the community

of a thousand folk was probably right. It is on an assumption of this sort that government by majorities depends; and at a first view it seems right enough. But what are the actual facts? The chance of a right decision in each case is (on the average) the same as that of drawing one white ball from a vase containing ten balls, one only of which is white. If one were told that among the thousand balls severally drawn from a thousand such vases, nine hundred were of one color—unnamed—would one infer that they must probably be white? Would one not on the contrary feel absolutely certain that whatever color they may be, white they assuredly are *not*? A mathematician, at any rate, would so conclude, for he knows how overwhelming (practically infinite) are the odds against more than about one-tenth of the drawn balls being of the color which appears but once among ten balls in each vase. If all the thousand were announced as of one color—and this, according to believers in the immortality of the soul, would correspond best with the all but uniform opinion of mankind on that question—the chance that that color would be further announced to be white, would be one in a number represented by one followed by a thousand noughts. If the whole space within our sidereal universe were enlarged a million fold, and so enlarged, were filled with minute balls closely packed and so small that a million of them would, together, not be discernible with the most powerful microscope; and if among all these but one were white, the chance of a white ball being drawn from each one of all the thousand vases would be many millions of times less than that of drawing that single white ball at random from that practical infinity of balls of other colors.

Not less unlikely than this,—and therefore infinitely unlikely,—would it be that a thousand persons would independently agree in giving a right decision on a question where the probability of each concluding right would be as one in ten. And be it remembered that this chance of being right, though small in itself, is great compared with the chance of being right on any question of real difficulty, such, for example, as that of a future life. And on this supremely difficult question not a thousand, but, we are told, all the thousands of millions who have ever thought earnestly about it have been in agreement. It is infinitely more unlikely, then, that their common opinion can be right than even that from the thousand vases of our illustration the white ball should in every case have been drawn.

In passing, I may mention that Friar Bacon was the first, so far as I know, to point out the fallacy underlying the argument from common consent. "With all our strength," he says (in his *Opus Majus*, A. D. 1267), "we must prefer reason to custom, and the opinions of the wise and good to the perceptions of the vulgar; and we must not use the triple argument,—that is to say, this

has been laid down, this is usual, this has been common, *therefore it is to be held by.* For *the very opposite conclusion* does much better follow from the premises. And though the whole world be possessed by these causes of error, let us freely hear opinions contrary to established usage."

It is essential to this argument as to the drawing of correct inferences from common consent, that the matter in question should involve some difficulty, though not necessarily any great difficulty. All men agree that the sun shines, and all men are right, for the shining of the sun is obvious; but in Shakespeare's time all men agreed that the sun is fire, insomuch that he says "doubt that the sun is fire," as he would say, doubt that you live and move; but because that is a matter of less simplicity common consent should have been looked on with suspicion, and, as a matter of fact, we know now that the sun, whatsoever he may be, is assuredly not fire. In like manner with hundreds of matters which everyone who possesses the ordinary senses seems able to deal with, so simple do they appear; yet the common opinion about them, where there has been any real difficulty, has invariably been common error.

For it is by no means necessary, as I have said, that great difficulty should be involved in a question to render universal consent respecting it decisive evidence of error; but in such cases we must recognize the existence of some circumstance or circumstances by which opinion has been biased. It is practically impossible that *all* the members of a community of a thousand should arrive at a correct conclusion on some question where the chance for each deciding right was so great as nine in ten. If they all agreed we should have to recognize some bias one way or another, and to decide independently whether that bias was such as to be toward truth or toward error.

It will hardly be denied that the question of the possible immortality of man is one of considerable difficulty. The often vaunted fact that even the most cautious men of science will not pronounce immortality to be absolutely impossible, proves that the matter is not one to be decided in an instant by average minds. If, then, it is true that average minds have, with scarcely an exception, pronounced in favor of the doctrine of the soul's immortality, we must infer at least a very high degree of probability against the doctrine, if not absolute certainty that the doctrine is erroneous. Unless, indeed, we can recognize direct evidence in favor of the doctrine, or some reason to believe that opinions would be biased, and in the direction of the truth.

But we know that the only evidence on which the doctrine has ever been based is that derived from dreams about the dead, which were regarded, very naturally, as indicating the continued existence of the departed in some shadowy or spiritual form. We know now that this evidence has no such meaning as was attributed to

it during the childhood of races, and is still attributed to it by children and persons of weak mind.

The evidence of revelation can, of course, not be cited *here*, because the doctrines that there must be a God of such a nature as to take personal interest in man, and that he must have revealed his will to man, belong to those respecting which common opinion has given its most decisive, and therefore its almost certainly erroneous verdict.

As regards bias, there can be no doubt that, at the time when men think most of the question of a future life, viz., when some beloved one has passed away, most men desire to entertain the thought that the dead still live in another form, though when they reason about their hope (the few who are able to) they can picture no form of future life in which they could wish their loved ones to be renewed. There is certainly no reason for supposing that bias in this case would be toward truth rather than toward error.

When the most earnest believers in a future life give their reasons for the faith that is in them, we feel still more strongly that such fanciful reasoning cannot be expected to guide men to the truth. I have before me a sermon by the Rev. Mr. Brooks, Doctor of Divinity, in Boston, in which he speaks of a man immediately after death. "That man is dead," he says; "what is it that has come? A minute ago I was talking with him, he was speaking to me of the loves and dreams and imaginings with which I have been familiar, as I have known him these forty years. Now that is stopped. Shall I believe that an end has come to that vitality? The spiritual life is in the powers of the soul, not in the accident which linked them in association with this body in which the physical change has taken place. Shall I believe that they have ceased because it has ceased to be their minister?" To which he answers: "No, because what has passed away is merely the bodily life, not the inner life with its thoughts and emotions." He does not deem it necessary to show that the power of conceiving thoughts or feeling emotions is not as essentially a quality of that which has been destroyed by death, as the power of making fine cloth is a quality of a weaving-machine, and presumably brought to an end by death as the weaving powers of the machine by its destruction. What he says of the man might equally be said, and with about as much reason, of the machine. "A minute ago that machine was weaving beautiful cloth, now it has done its last work, and all its parts will presently be applied to other uses. Shall I believe that the powers of working charming patterns it possessed so short a time since are gone because its mere material structure is to be destroyed? Never; for only the merest accident linked those powers with the machinery!" No answer is needed to one argument any more than to the other. The destroyed machine lives no longer as a

piece of mechanism; it can never more produce the delicate textures or the charming patterns which it produced when it existed as a machine. It will live only in its products, direct and indirect. And in like manner, it seems reasonable to believe (though none can say it has been proved) the dead exist no longer as beings capable of feeling or expressing emotions. They live only in their work,—in the influences, direct and indirect, which they have produced on those around them during life, or on those who are to come hereafter. This, at any rate,—setting aside the rejected evidence of dreams and visions, and the more than doubtful evidence of revelation, so-called, which is full of errors in less difficult matters,—is the conclusion to which reasoning points as the most probable. Seeing that common consent points to the contrary doctrine, we may say that the true argument from common consent proves, almost to demonstration, that the doctrine of the soul's immortality is one of the common errors into which common consent is bound to fall.

THE MODERN SKEPTIC.

BY JOHN BURROUGHS.

Part I.

A recent writer upon skepticism describes the skeptic as generally a "malcontent," not only in religion, but in politics and in society. "He is the personification of the ancient belief regarding the souls of the unburied dead," that is, he goes wandering about homeless and disconsolate. But few honest skeptics, I imagine, will see themselves in this portrait. The religious skeptics of to-day are a very large class, larger than ever before, and they are by no means the restless and unhappy set they are here described. On the contrary they are among the most hopeful, intelligent, patriotic, upright and wisely conservative of our citizens. Let us see; probably four-fifths of the literary men in this country and in Great Britain, and a still larger per cent. on the continent, are what would be called skeptics; a large proportion of journalists and editors are skeptics; half the lawyers, more than half the doctors, a large per cent. of the teachers, a large per cent. of the business men, almost all the scientific men, and a great many orthodox clergymen, if they were to avow their real convictions, would confess to some shade of skepticism or religious unbelief. They find the creeds in which they were nurtured no longer credible. Indeed, there are but few great names in literature, in science or philosophy for a hundred years, that could not be convicted of some shade of religious skepticism—skepticism about the miracles, the sacraments, vicarious atonement, original sin, or some other dogma.

The lawyers are probably less inclined to skepticism than the doctors, because the legal mind is closer akin to the theological mind; it has chiefly to do with arbitrary and artificial questions and distinctions, and is brought less under the influence of natural causes than

that of the medical practitioner. The lawyer falls into personal and exclusive views; he makes the cause of his client his own; and his whole training is to beget a habit of mind quite the opposite of the scientific. The physicians were the first to discredit witchcraft and to write against it, but the lawyers cherished and defended the belief nearly as long as did the clergy. The legalism, too, which has invaded Christianity, and which is such a repulsive feature in certain of the creeds, especially that of Calvinism, is the work of the attorney habit of mind.

The writer referred to is correct, however, in saying that "faith is a living force mostly in active temperaments." There is less skepticism among the farmers and among the laboring classes generally, except may be here and there in large cities, and very little among the women. Women are slow to reason, but quick to feel and to believe, and they cannot face the chill of the great cosmic out of doors without being clad in some tangible faith. The mass of the people are indifferent rather than skeptical. They are undoubtedly drifting away from the creeds of their fathers, but they have not yet entirely lost sight of them. "The various modes of worship which prevailed in the Roman world," says Gibbon, "were all considered by the people as equally true; by the philosopher as equally false, and by the magistrate as equally useful." This is probably very much the case amid all nations, at all times.

Men of large action, too, generals, statesmen, sea captains, explorers, usually share the religion of their contemporaries. Frederick the Great is perhaps the most notable exception to this rule. A popular religion is always definite and practical, clothes itself in concrete forms, and appeals to the active temperament. The man of action has little time for reflection, to return upon himself and entertain intellectual propositions. Faith is an earlier and, in many ways, a healthier act of the mind than reason, because faith leads to action, while reason makes us hesitate and put off a decision. The church has always had trouble with philosophers and physicians, with men who wanted to know the reason of things and trace the connection of cause and effect. There was little skepticism in Greece until after the sophists appeared, the critics, men of ideas, who directed a free play of thought upon all objects and subjects, a type of mind which beget the philosophers of Athens, but not the great poets and artists. They came earlier, when there was more faith and less reason in Greece.

In fact, the great days of Greece were not when its head was the clearest, but when its patriotism and religion were the most fervent. As the heart cools the head clears. Those great emotional uprisings, those religious enthusiasms, which come in time to all nations, are not days of right reason, nor of correct science, still

they are the periods of history we like best to dwell upon.

It is always easier to believe than to deny. Our minds are naturally affirmative; it is not till the second or third thought that doubt begins. Belief is so vital and necessary that one would say the tendency was made strong at the perpetual risk of extra belief and superstition; it were better to believe too much than not enough. Hence mankind have always believed too much, as if to make sure that the anchor hold. To believe just enough, to free his mind from all cant and from all illusion, and see things just as in themselves they are, is the aim of the philosopher or of the true skeptic.

Men's minds are nearly always under a spell of some kind. What a spell the mind of Europe was under during the Crusades! What a foolish and misdirected enthusiasm this uprising seems to us, whose minds are under some other spell, say the scientific spell. What a spell the same mind was under for centuries with reference to witchcraft, even such a man as Sir Matthew Hale believing in it and defending it. Here was an astute legal mind, and an incorruptible judge, a man who could sift evidence and detect fraud, and yet the spell of his times in regard to witchcraft was upon him, and he could not escape it. The mind reasons in such cases, but it reasons inside of a magical circle, the bounds of which it cannot pass, cannot see. Most of us reason inside of a circle, when we reason at all, with reference to our religion; we are under its spell, its illusion. What a spell the mind of Christendom has been under with reference to miracles—could not get or see beyond the magic circle. The Catholic mind is still under this spell. What a spell the mind of the world was under in the third and fourth centuries with reference to magic, and in later times with reference to astrology, and alchemy and demoniac possessions! The skeptic sees how faith or belief tends perpetually to fulfill itself. If I believed in ghosts I should doubtless see ghosts. People always have. Those who believe in spiritism have wonderful things to relate; but to a cool, unbiased person not one scrap of evidence is forthcoming. In a credulous age miracles happen, but never in a scientific one. The evidences of the popular religion are evidences only to those who are already convinced. The man who believes in prayer—his prayers are answered; the more sincere the belief the more sure the answer. Sincerity of belief is of itself a blessing and makes us stronger. Faith-cures, of which we are just now hearing, have their root in this principle, as do also the power of charms, amulets, symbols, etc. Curses, anathemas, tend to fulfill themselves when the imagination is impressed by them. Think what power for mischief must have resided in the curses of the church when men's minds were under the theological spell; excommunication made man an outcast in the universe. The things

we fear, no matter how imaginary, stamp our lives. Of the things we love the same is true. Plutarch tells of a certain bird which the ancients used to look upon to cure jaundice—this was an early form of faith-cure. The opposite effect, or *faith-kill*, is related with regard to a bird in Ceylon, called the devil-bird. This bird makes a doleful wailing by night, and as it is seldom seen, a dread superstition has gathered about it. The natives have a fixed belief that whoever sees the bird will surely die shortly after, and, as a matter of fact, this usually proves true. The native is so frightened and so overpowered by his faith in the evil omen that he refuses food, goes into a decline and soon dies. Thus faith kills and faith cures. Faith in your physician is often worth more to you than his medicines; a soldier's faith in his general doubles or trebles his force.

The skeptic sees the benefits of a strong, active faith, irrespective of the object toward which it is directed. Faith in one's self and in the justice of one's cause is always half the battle. Can there be any doubt in the mind of the disinterested observer that the influence of such a man, say, as Mr. Moody, is more beneficial than the influence of such an orator as Mr. Ingersoll? Mr. Ingersoll appeals to reason and to common sense, and the victory seems easily on his side. He espouses the cause of the world against the church and the priests; and while the church and the priests suffer, no man is benefited. It is all down-hill work with the witty orator; it is what we like to hear and we go with him naturally and easily. It is all up-hill work with Mr. Moody; he rebukes pride and sensuality; he calls the worldling to a higher life; he seeks to awaken aspirations toward a higher and nobler good, and in the growth of character, the man who leads us the difficult way, who persuades us to do what we don't want to do, what our pride and ease and self-indulgence stand in the way of our doing, is a better man than he who takes us with the current of our natural desires and tendencies. Greater things are possible, nobler and more disinterested lives, from Mr. Moody's point of view than from Mr. Ingersoll's. It is not for nothing that we have had so long thundered into our ears the benefits of belief and the dangers of skepticism and doubt. And it is not because the things we have been asked to believe are in themselves true, but because the very act of belief is in itself wholesome and sets the current going, while doubt paralyzes and leads to stagnation. But how shall we believe a thing unless we know it to be true? Ah, there is the rub! But man in all ages has been the victim of delusions, and the gain to him has been that they have kept him going; that they have kept him working and striving. The great periods in history have been periods of strong faith, of serious affirmation, not of denial, nor yet of reason. Yet I would not say that faith alone has ever made a people

or an individual great. Spain, as a nation, probably has as much faith as ever, and yet how is she fallen from the three hundred years ago. But faith is more frequently the parent of great deeds than reason or denial. From the point of view of the nation, faith is best. There can be no strong feeling of nationality without a certain narrowness and unreasonableness. The philosophy of Athens no doubt weakened the feeling of nationality. They weakened the faith in the nation's gods; they had reference to universal ends. A proud, intense, exclusive nation like the Hellenes, had a kind of faith in itself and in its privileges and destiny, which, however conducive to the growth and strength of the nation, could not stand the light of reason and universal knowledge.

PSYCHIATRY, OR PSYCHOLOGICAL MEDICINE.

BY S. V. CLEVENGER, M.D.

Part II.

In institutions where the care of patients is not the principal object or where the management has not profited by the experience of those who have scientifically studied how to obtain the best results, resort is still had to restraint apparatus and mistaken means of reducing refractory cases to obedience. Among these may be named the "crib," bedstrap, fingerless gloves, handless sleeves, muffs, belts, manacles, chains, sacks, camisoles, buckled straps, leathern masks, pear-shaped frames and gags, wicker baskets, suspended boxes, the restraint chair, the dark chamber, padded room, the rotary machine, the suspended seat, the hanging mat, the hollow wheel, the swing, the douche and the surprise bath.

Scientific inquiry has led to the abandonment of the majority of these, and the substitution for them of more intelligent attendance. Some asylums adopt the extreme of absolute non-restraint by appliances of any kind, and while this ultra-abandonment may not be judicious in all cases, it is better by far than to allow resort to be had to the mildest restraint instruments, except under the personal supervision of the *good* asylum physician.

It has, also, been proven that faithful medical attention to patients during the day time not only prevents the hideous disorder and noises associated with the name of Bedlam, but insures sleep to the turbulent, and otherwise sleepless, far better than routine drugging at night to quiet, for the nonce, the shrieking maniac.

It would require more time than we can spare to review the development of the modern scientific asylum in its working details, but we may sum up the results in the statement that the patient has therein the best chance for his restoration to reason, and under all circumstances is ensured kind treatment.

Avoiding the dry details of the evolution of scientific methods of research into nervous and mental diseases, a survey of what is being attempted in such fields might be interesting:

The study is divided into clinical and pathological, and requires the co-operation of trained minds. One set of observers records (roughly speaking) all that the insane person does, and the course of his malady. Another carefully examines the healthy and diseased structures of those who die insane; still others scrutinize the bodily condition of the living patient as to his eye sight, hearing and other senses; search is made for any impairment of motility, and through what can be gained from friends, and sometimes the patient himself, less obvious diseases. The ancestry of each case is carefully investigated, for heredity plays an active part in mental decrepitude.

Acting under the advice of these observers the attending physician prescribes, and adds his portion to the written statements. The completed histories are grouped and studied by all these physicians with especial reference to whatever revelations each student may obtain. The fact that by this inductive process numerous otherwise unattainable truths have been discovered in the domain of mental pathology, should arrest the attention of every psychological student whatever his bias might be. During the last fifty years it has been ascertained by simple inspection of recorded observations that certain delusions, illusions and hallucinations accompany certain well-defined diseases, but before describing a few of these it is best to define what these mental or sense aberrations are. Spitzka's terse phraseology is worth quoting:

An insane delusion is "a faulty idea growing out of a weakening or perversion of the logical apparatus." Delusions are divisible into systematized or specific and unsystematized or general.

"An hallucination is the perception of an object as a real presence without a real presence to justify the perception." In other words, the hallucinated person sees, feels, hears, tastes or smells unrealities.

"An illusion is the perception of an object actually present, but in characters which that object does not really possess." The difference between the hallucination and the illusion is that the former is wholly without apparent basis, and the illusion is perverted perception.

A side comment may account for much in scientific papers that dissatisfies the average reader. The real physiological psychologist has waded through so much and has acquired justifiably positive convictions upon many subjects through his untiring zeal, that he becomes incomprehensible in his ways of thinking to even those whom he would willingly instruct. Step by step he has reached what to him are aphorisms, and when he presents the bare results without the qualifications that would be taken for granted by a co-delver the sciolist dissents from his conclusions as mere *dicta*, or worse than that, readily assents with "any fool knows that."

Comically enough many of the most laborious scientific explorations have resulted in justifying some popular estimate of facts, though the thinker has painstakingly determined the truth, where the average individual has accepted it through tradition, or because consonant with his own limited experience.

It has been ascertained, by the means mentioned, that when an almost complete inversion of character takes place; for example, when the temperate, economical, moral, cautious business man becomes boisterous, convivial, immoral and a spendthrift, and claims to be practically worth millions, or when the theologically biased individual asserts himself as the Almighty, or the student arrogates to himself outrageous mental superiority—all of which the French alienists generically class as *délire des grandeurs*, the probability is in favor of a diagnosis of *parietic dementia*, which may be or may not be associated with a blunted touch sense and defective motility such as a staggering gait. It has startled physicians to be convinced that the physical conditions, the changes that occur in the brain in this disease are fully as well, if not better understood, by alienists than those that take place in pneumonia.

Even the politician doctor, at the head of the average American asylum, will glibly tell you that unequally dilated pupils, a peculiar drawling speech and delusions of grandeur evidence *parietic dementia*, and that the duration is usually three years before death, which usually occurs during one of the maniacal outbreaks or convulsions that interlude the disease.

But that same political doctor is ignorant of the fact that certain invariable mechanical causes precede such phenomena. He does not know, nor does he care to know, that the convulsions had been preceded by a plugging of the minute vessels of the brain, and that the maniacal outbreaks were accompanied with, if they did not depend upon, an arrest of the blood circulation.

Thus it has been determined that certain peculiar mental conditions point to gout, rheumatism or syphilis, as causes; and these are the most curable of all the psychoses.

When a patient has undertaken a peculiar self-mutilation, imagines that his friends desire to poison him, and has delusions of marital infidelity it is in the great majority of cases alcoholic insanity.

Religious ecstasy is usually associated with erotism, and when such a patient kneels pleadingly to the official, if he be well-informed, he will know that such lunatic is one of the most treacherous and murderous he may meet.

Insanity apparently depending upon lung consumption (known as phthisical insanity) is often diagnosed as such through the peculiar suspiciousness of the patient, who usually declares that his relatives are trying to steal from or to murder him. Similar delusions may follow neck wounds and sunstroke.

Melancholic conditions are most frequently associated with quantitative or qualitative blood deficiencies; maniacal states, *per contra*, with the other extreme of superabundance of blood in the head, and yet marked exceptions to these rules occur which the alienist looks to the chemical physiologist to explain. A peculiar mental deterioration is caused by a fatty degeneration of the brain arteries.

A sudden occurrence of idea confusion, or a similar invasion of excessive stupidity, known as confusional and as stuporous insanities can be predicted as recoverable in most cases.

When any patient recovers weight without mental improvement, the prognosis is unfavorable, but where the return of mentality is accompanied by increase in flesh it is favorable.

Senile dementia is characterized by penuriousness which may reach a degree that will cause millionaires to starve themselves. They are especially susceptible to undue influence in the matter of property disposition, though very suspicious of those who were the subjects of their affection in their healthy periods.

Memories (as Ch. Ribot prefers to designate what is usually called memory) fade away inversely as acquired; for example, in old age, and its insanity, olden events are recalled with readiness, while recent events are frequently obliterated from the mind.

In some head injuries and nervous derangements, particularly where there is an imperfect circulation in the brain, special memories may be lost, and most commonly for proper nouns, then common nouns, verbs, adjectives are next in order liable to be forgotten, while expletives are usually recalled and pronounced as readily and more frequently than before.

Certain definite parts of the brain are known to centralize certain functions, not in the phrenological sense, but in a way that enables the modern surgeon, under the direction of the physician versed in this localization, to cut down upon certain regions of the brain to remove organic troubles even where there were no external evidences of the difficulty.

Thus the speech faculty, visual memory, and auditory memory occupy defined portions of the brain, and when these places are diseased, the ability to speak, or to read, or to understand language may be separately or conjointly lost, while sight and hearing, as senses, are unimpaired.

These are but a very small portion of the results of the alienist's studies. Huxley illustrates the proper method of studying man objectively, as a vertebrate, by asking you to imagine the student as a superior sort of creature who has visited the earth from the moon, and who finds *homo* among other genera, dissects and experiments with him, as he does the other animals, and being free from bias arrives at certain conclusions regarding

his mechanism. The psychological physiologist with the aid of microscopy may be compared with the electrical engineer from some other planet who studies out the subterranean and aërial telegraph, telephone and lighting lines he finds in a mundane city, to determine their connections, centers and uses. The higher animals, including man, have an innumerable lot of nerve connections running just as definitely and symmetrically between bodily points, and subserving as diverse functions as the fingers or the facial features are definite and have uses.

Morel's dictum that "the brain is the seat of insanity, but not always the seat of its cause," is based upon the fact that while the brain is the organ of the mind, the end and aim of both brain and mind is to correlate bodily functions and serve the purposes of the body. The central telegraph office as the collecting and distributing point for messages need not be the location of a difficulty that may shut off its work. The branching lines may be destroyed by storms, or the chief industries of a metropolis having ceased, the main office for telegrams cannot receive or transmit what is not sent there.

The physiological psychologist latterly recognizes the co-dependence of bodily organs and that superiority of function is purely relative, just as in sociological matters the harmonious working of the whole depends upon each part doing its duty.

In the preceding, an attempt has been made to convey some idea of the enormous work that is being done toward the mitigation of insanity and to obtain knowledge of the mental processes in health and disease. Of course, in this paper but a feeble idea has been imparted of the actual operations of the well-equipped, thoroughly scientific insane asylum. Nothing short of a residence in both could acquaint one with the astounding differences that exist between the ordinary political asylum and the many well-managed European hospitals for the insane, such as the West Riding, England; Morning-side, Scotland; Dublin, Ireland; Charenton, France; Christiania, Norway; Roeskild, Denmark; Stockholm, Sweden; Gratz, Munich, and Wurzburg, Germany.

Illinoisians will learn with pride that the Eastern Illinois Hospital for the Insane at Kankakee, by alienists the world over, is deservedly classed with the institutions mentioned.

PRESENT AIMS.

BY ARTHUR R. KIMBALL.

Humanity has ever been burdened with cares and perplexed with doubts; but as constantly in mankind has resided a vague intuition, that, near at hand, lies the satisfaction of all its wants, could only the open sesame be pronounced. When man first discovers in himself the thirst of the soul and hunger of the intellect, nature

teaches him that spiritual and intellectual pabulum exists somewhere for the support of these higher cravings. He feels sure that the doors will be opened if he may only knock at the portals. But *how* heart and understanding are destined to be upbuilt—the long process of experience and gradual development—he does not comprehend. Nature teaches him that there is a proper and legitimate satisfaction for all his longings, and so he imagines if he could but dine at the table of the gods, perfection would burst upon him. Experience, alone, schools him in the long spiritual evolution of assimilation and application in uses.

When the nations knew but a small portion of the earth, they expected some undiscovered clime to solve this problem for them, therefore they wandered from place to place. Until after the discovery of the New World there was a broadspread expectation of finding in nature's material conditions the new paradise, endowed with fountains of perpetual youth. But through many different channels experience impressed the truth upon man that his *entire* nature cannot be put off with childish playthings. Indeed, experience has *always* been teaching this truth, in a greater or smaller way; but now it has been tested on a most gigantic scale, with all the resources of the world at hand, and failure has resulted—failure as swift and speedy as ever before. Therefore, because earth does not, *of itself and alone*, fulfil the higher needs of humanity, a conception has more or less prevailed that these wants cannot be satisfied *on* earth. Thus arise the two points between which man commonly chooses. He may deny the good in the sensible, and look to a transmundane existence alone to fulfill life, or he may turn to the actual, in a newer and higher sense, to find his heaven there. These are the debating grounds of to-day, and although comprehensive thought will unqualifiedly deny neither, yet it can but see that one is the land where pygmies struggle, the other the wrestling-place of the giants. Mature thought may not doubt post-mortem existence, but it cannot accept this for the great immortality—the goal of Christianity; it does not feel itself asked to believe that by any sudden magic, is ignorance to be turned into wisdom and folly into happiness; moreover, it holds that Christianity bids us live and work in the moment. Faith, to it, means no visionary forelooking, but an actual trust and belief in the all good of the present. Nevertheless, it looks to a broad future of progress and the onward march of humanity, and the individual, it conceives, must proceed by various states and conditions. And this is what characterizes our present age; this is the immortality as derived from *practice*, and separate from the current *theoretic* immortality; and to embody such immortal life, it is evident that every element of the broad universe must be preserved—both the sensible and spiritual, and that which shall bind them together.

On these principles does modern activity proceed. It has in view the temple of progress, approached not by one way alone, but by paths centering to it from every direction.

Science and poetry have found, at length, the beauty of the commonplace. Men have more than intellectually conceived this—they have begun to live it.

The universal is the aim of science, but science now believes that this can be found in the particulars alone. Bitter experience becomes robed in the garb of poetry when we recognize this truth; for things must first be learned in their special relation of contrast and relativity, in order to be known as general and absolute. So duty and pain must exist as the actuating causes of relative experience; love, of the absolute. And in our lives

both kinds of experience are parallel, and so duty and love run along together in heart and mind, and lend each other strength.

Thus in our own age is human force at work—working and waiting for the final movement of organization which shall conclude the struggle in the blind experience of attaining, and open to clear vision a life of experience in uses and resultant new developments. Then will dawn upon us a new life, as distinct and different from the old as starlight from the world of sunbeams. This for our future; but in our present, we still work on, and find a not unmixed happiness in discovering and striking each separate note and chord of experience, until the Grand Master comes to make harmony for us out of the works of our weary fingers.

EGOITY.

BY EMMA TUTTLE.

"The absolute loneliness of each human soul in its interior experiences is the most awful fact of this human life. Alone we enter the earth, and alone we depart from it. So much of our living as is known to eye and ear, our kin, our lovers, our fellow-men possess; but it is not much."

And it is well; our unsuspected sorrows,
Our wearing struggles and our sad defeats
Were none the lighter for us could we shadow
With dark admixture lives all blooms and sweets,
Frail finite love is varying and short-sighted,
And finite pity cannot comprehend
The depth and dimness of a soul's endeavors,
What matter if it censure or defend!

Friends we know best, alas, they fail to read us
Almost as those who know us not at all;
And yet we blame not knowing all too truly
Souls dwell in unapproachable enthrall.
Intangibly do human passions fret us;
Sometimes maliciously, but oftener far
In heedless vacant ignorance, not knowing
Where thorns are mangling, nor if thorns there are.

O, soldier soul! In life's unceasing battle
No rest from action, no discharge, no truce!
Winning or fainting, failing or exulting
Thy powers are thine alone for fullest use.
Love may essay to aid, Hate to destroy thee,
Still thou must fight in solitary strength
Each hour, each moment, even to that ending
Where days and hours grow infinite in length.

But in the lulls we dream of golden ages,
Holy transparencies of peace and rest,
When Time, which must eventually be tender
Shall take the ice-masks off from face and breast.
Unlanguage'd, unexplained but comprehended
Who, then, will care to utter plaint or moan,
Feeling the long deep loneliness is broken?
All this lies past the tabulated stone.

DOWN AND UP.

BY ANNA OLCOTT COMMELIN.

Low in the vale the mists hang cold and gray,
The sparkling, winding river lost to view,
The trees, the oaks and maples that I knew
Shrouded in film of darkness all the day:
Vapors and clouds alone before my eyes,
Where, at the mountain's base, the hamlet lies.

But up, far up, where rises peak on peak,
In solemn grandeur stretching to the sky,
Where tower Franconia's stately summits high,
A glow from Heaven shows to those who seek;
Transfiguring the rugged mountain's height,
Crowning its purpled shades with sunset light.

Down in the dusty street I hear the sound
Of discord, and the tread of tired feet,
Weary and fevered with the pavement's heat,
And all the restless toil that make's life's round:
Like monochrome the outlook, stone on stone,
Vista unvaried, greets the eye alone.

But up from window high, a world I know
Of budding elms and swaying branches green,
And myriad interlacing boughs between
Fair openings that the blue of Heaven show:
No sound save chirp and song of happy bird,
And wingéd fluttering aloft is heard.

Once, in a darkened room, in dusk of day,
From mullioned window came a beam of light
Falling alone on marble statue white,
Bathing its noble face in sunset ray.
In golden glory on the shaded room
Serene it shone above the twilight gloom,
Like soul that knows the troubled scenes below,
But dwells aloft in Heaven's celestial glow!

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixon Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of *THE OPEN COURT* is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to *THE OPEN COURT* should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, JUNE 9, 1887.

QUID PRO QUO.

The Inter-State Commerce Law is doubtless defective in some of its provisions, otherwise there would not be so many protests against it, but the second section of that law, which forbids the granting of free passes to favored individuals by railroad presidents or directors, strikes us as a just one, and one which is in a greater degree than dreamed of by its framers a progressive move in the direction of ethical reform.

One of the strongest objections made by those who have given the subject careful study, against the indiscriminate giving of charity, is that such gifts tend to encourage pauperism by discouraging self-respecting independence in individuals.

But if acceptance of needed aid for which no return can be reasonably expected by those who give it, insidiously lowers morally the struggling poverty stricken classes, how can the acceptance of gifts by those in no pecuniary need, where there are no special ties of love or friendship between the giver and receiver, be less

demoralizing in effect, even though the classes whose members are thus benefited may be the so-called "higher?"

Until the days when ethics and religion shall be established on a scientific basis, doubtless there will continue to be more or less of this degrading bribe taking and "tip" receiving, for such in truth is all acceptance of favors for which no honorable reason can be given.

Let us briefly consider some phases of this demoralizing habit that we may the more easily observe its morally hurtful tendency.

Taking the free pass system to begin with: To whom have free passes mainly been given? To the hard-working, low-waged employes of the roads? To the very poor whom necessity requires to make journeys in the interest of duty, affection or bread-winning? No, not to these, for often by the grim laws of railroad corporations have sick, sad, disheartened and penniless men and women been ruthlessly put off the train far from their destination at no matter what outcome of heart-break, of personal loss or despair, because they have not possessed the means to pay the full amount of fare. But the recipients of the railroad companies' bounty have usually been people abundantly able to pay, prominent politicians, persons of high social standing possessing in some way great public influence, or wealthy capitalists; none of them in need of charity, but amply able to supply every want and to pay their own traveling expenses—persons to whom the free pass is only a "courtesy." A "courtesy," however, which both parties vaguely understand is to be repaid by some favorable expression of opinion or complimentary vote in case a time comes when the company or one of its directors, whether in the right or wrong, needs the influence of such expressed opinion or helpful vote. The "courtesy" then, divested of sophistry, is really a bribe, a mortgage on the freedom of the acceptor's judgment in any case in which this road or its officers may in future be concerned.

Since railroad corporations, in order to reap profit in return for the benefit they confer upon the public, find it necessary to ask a certain rate of fare, that rate should be made the same for all, unless for some special good reason, as in the case of children, excursion parties, etc., where justice or interest renders it proper to make deductions from full rates. We have never overheard a clergyman ask for half-rates at the ticket office on account of his profession, without feeling a sympathetic shame-facedness for him, as though (especially if he chanced to be physically a fine-looking specimen of manhood) he had been somehow inadvertently insulted by being placed on a level with "children under twelve years of age," and half-expecting him to rebel as we once saw a well-grown Miss, really under the regulation age, who when the conductor demurred at her half-fare

ticket and her petite mother explained, grew red in the face with hurt pride and as the conductor passed on, exclaimed vehemently, "Mamma I *never* will ride on the cars again unless you buy me a whole ticket, for I'm as big as you are and I *ought* to pay full fare!"

Every day nearly the newspapers bear record of the mean avarice of men in high places, men chosen by their fellows as the representatives of the wisdom, dignity and conscientiousness of the people who thus honor them, but who for a contemptible addition to their already sufficient means, allow themselves to become engaged in questionable transactions and sell to the highest bidder their influence, integrity and self-respect. And so used have we become to this sort of thing that the public sense of right has become in a manner blunted, and even when outraged justice gets hold of some more daring offender, he is not looked upon with the horror he would be could the far-reaching extent and result of his wrong doing in its poisonous workings upon social morality be fully appreciated.

In our municipalities things are no better—often worse. Here is a specimen of editorial comment, which is by no means rare in the newspapers of Eastern as well as Western cities:

We presume that the festive alderman or the bibulous common councilman who orders a dinner for himself and friends, or takes a carriage for his own private business or pleasure, and has the expense charged to the city, would not agree that he thereby becomes guilty of petty larceny, but that is just the size of it. There is no law authorizing such expenditures. The custom has grown up from small beginnings, but the aldermen and common councilmen have no more right to regale themselves and their friends at the public expense than they have to steal the money of the taxpayers before or after it has been paid into the city treasury.

It is sometimes said in defense of the "junketings," private money-making out of public needs and the public purse, doubtful personal transactions on city authority and expensive underhandedness of city officials, that they are ill-paid and must reimburse themselves in some way for the loss of time and money in their private business. But a sense of honor equal to that we expect from the day laborer who undertakes to plant our garden or paint our house, would forbid these men to accept a position which they cannot afford to fill save by a sacrifice of their honor and by sinking to the level of bribe takers and petty plunderers.

The ideal state of society can never arrive until men and women learn to be high-minded and self-respectful enough to refuse to accept favors not due them, until legislators understand that they are the ministers of justice and not of favoritism and refuse to waste the people's money in bestowing annuities on the well-to-do relatives and "relicts" of deceased prominent men, unless they are prepared to do the same by the thousands of indigent wives and children

of men now dead who living performed well their duty to State and society; until rich men who have performed worthy and beneficent acts refuse to brush the bloom of generosity from those acts by accepting commemorative money gifts gathered alike from rich and poor, willing and unwilling sources; until men in high or low positions refuse to accept from underlings or employes "testimonials" which leave the public in doubt as to whether won by appreciated worth or by politic manœuvering; until lovers about to wed refuse to levy a tax upon the love, pride or generosity of friends and relatives by their virtual bid for wedding presents; until men who hire service from other men for their customers, pay for such service a fair wage in honest fashion and forbid the free-booting of "tipping;" until in short, labor is paid *wages* and not put to dishonest make-shifts to secure its equivalent, and labor's wage is not given to those who do not need and have not earned it. S. A. U.

SECOND ANNUAL MEETING OF THE AMERICAN ECONOMIC ASSOCIATION.

Although the American Economic Association has been organized but little over a year, it has gained considerable prominence in the public mind. Its president, General Francis A. Walker, is widely known as an educator and statistician, as well as an economist, and his name has given the association a certain prestige which it could not otherwise so early have attained. The second annual meeting held in Boston, May 21-25, at the same time as the meeting of the American Historical Association, was marked by a keen interest in questions of practical economics and showed careful preparation on the part of speakers. The session opened with an address from the president, the most marked feature of which was that the speaker dwelt upon the importance of some form of control over the number and character of foreign immigrants. The forenoon of Monday was devoted to a study of the railroad problem. The association has adopted the policy of appointing standing committees to which are referred various topics for detailed study and report. The chairman of the Committee of Transportation is Professor E. J. James, of the University of Pennsylvania, under whose direction the papers on this topic were presented. After an historical sketch by the chairman of the agitation leading to the enactment of Interstate Commerce Bill, Dr. E. R. A. Seligman, of Columbia College, read a paper on the "Long and Short Haul Clause." The comparison drawn between the principle of public taxation and the principle upon which railroad tariffs should be drawn was exceedingly suggestive. Mr. Simon Stern, of New York City, then reviewed the Italian Railway Commission,

as the result of which private companies gained control over the railroads in that country. He criticised the presentation of this subject as presented in Mr. Hadley's book on *Railroad Transportation* and, as Professor Hadley was present, this, of course, gave rise to a lively and interesting discussion.

The session of Tuesday morning was devoted to a consideration of the condition of gas works, water works, and street railways in the United States. It was the purpose of the Committee of Municipal Finance, of which Professor H. C. Adams was chairman, to discover what means had been adopted by municipal authorities to guard the interests of the public in case of these industries, which, from their very nature, are superior to the control of competition. Although the report was full of detail it was received with interest, and will form the subject of a monograph published by the association. Quite a number of other papers were read, the most important, perhaps, being an address before a joint session of the two associations, by Carroll D. Wright, on "The Study of Statistics in Colleges."

It will be seen from these brief mentions that the association deals with the practical questions of the day. Its influence is exerted fully as much by its publications as by its meetings. It has quite a strong membership in the East and hopes to extend its membership in the West during the coming year, and to this end has chosen Columbus, Ohio, as the place for its meeting in 1888.

GEORGE'S THEORY PROVED AND DISPROVED BY THEOLOGY.

The Nation rebukes Henry George for saying that "the Creator meant His bounties of nature equally for all men," and that "instead of this we have allowed them to become the property of a few individuals." *The Nation* wants to know how Mr. George came to find out the Creator's intentions in regard to the division of property, and, if what he says be true, how it happens "that the Creator has allowed His intentions to be frustrated by people like Jay Gould and Russell Sage?"

The Nation's criticism of Henry George's language is just and to the point; but this language is the language of the current theology, and is heard from almost every pulpit. And not only the clergy, but speakers and writers generally are accustomed to speak with confidence of the "intentions" of the Creator, with which *their* theories and objects are of course in harmony, and with which those of their opponents are always in conflict. Mr. George employs the same method, perhaps because he knows that the mass of people are, even in this age, more readily reached and more easily influenced by

bold declarations about the intentions of the Creator than by careful reasonings which involve no theological assumptions and no appeals to traditional religious beliefs and prejudices.

This method can be used and is used just as effectively against Mr. George's land theory as in its defense. Some months ago Archbishop Corrigan, replying to this theory, made "the primeval curse" the basis of land ownership. He said: "We take the air and the light as God gives them, and owe Him thanks for His bounty. It was only the earth which fell under the primeval curse; and only the earth, not the air or light, which man's industrious toil can coax back to something like its original fruitfulness. When he has done so, his great reward is to enjoy the results without hindrance from others."

Here we have a number of assumptions all contradicted by science: that the original condition of the earth was one of abounding fruitfulness; that the earth has been cursed, and that its condition is worse than when man first appeared; that the relation of earth and air,—to the ever-changing conditions of which the adjustments of organic life, of limb and lung, have been going on together through countless ages,—are such that one could be cursed and the other not. The one truth implied in the argument, but obscured by the Archbishop's mythological statements, is that the constitution and condition of the earth, and the nature and needs of man are such that labor is necessary to man's subsistence and comfort, and the only materials to which this labor can be applied are those of the earth. The question how land should be held cannot be decided by appeals to theology; it must be, in the opinion of most thinkers has already been, practically decided on grounds of public utility. But theological methods and mythological fancies employed in the discussion of economic problems and current practical issues will fare hardly between the disputants; and although they may for the moment impress unmodernized minds, their weakness is sure to be shown, and the superior value of the scientific method of treating such subjects must by contrast, be strikingly manifest.

The exodus of the Catholic children from the public schools promises to become complete. The late Council at Baltimore legislated to bring about this result, and the *Catholic Review*, commenting upon its action, says: "A thousand new Catholic schools will dot the American landscape before the close of 1887, and two hundred thousand children will make their abode in them." Catholics have for years protested against Protestant religious teaching in our public schools, and although the Catholics have all along really desired Catholic schools,

yet, if Protestants had not so generally disregarded the protests and petitions of their Catholic fellow citizens—protests and petitions based upon the rights of conscience—this general withdrawal of Catholic children from the public school would probably never have been urged by the ecclesiastical authorities. The demands of the Catholics have in the main been just, and they are evidently set in their main purpose, conscious of the wrongs which they have had to endure, because they have been in the minority. Of course they will soon ask that legislatures and senates consider their ideas of State education, and they will never be satisfied until they receive their proportionate amount from the public school fund for the support of their schools. Protestant Christians may yet feel constrained to join the movement for the complete secularization of public schools of this country and all other State institutions.

* * *

The *Freethinkers' Magazine* for June reprints "Labor Cranks," an article by James Parton, which appeared in a recent number of THE OPEN COURT. The associate editor, T. B. Wakeman, commenting upon it in the same number, thinks that it leads to some conclusions different from those intended by its author, namely: that questions that demand earnest attention from all men so affect certain minds that there is a consequent devotion, an intensity of application to them, that precludes the possibility of giving notice and due consideration to other things of equal importance. He suggests that the best way to head off cranks like Carlyle, John Brown, Fourier and Henry George, is to "gradually, justly and therefor safely" realize "their ideas as a part of the progress of the world." The world in general either pooh-poohs its "cranks" or silences them by law when they become too troublesome, but the ideas for which they stand cannot be crushed; it is but tying "the safety valve." Truth must ultimately prevail, and "ideas which become so dominant as to make noble natures cranks, should be used as wheels of progress and thus made a part of the rolling-stock of the world." Of this it may be said that a noble nature is not enough in itself to command us to accept theories and beliefs,—indeed there have been noble men whose thoughts on important subjects were untrue and would have led to disastrous results had they been accepted by the world. The question for us to ask upon the presentation of any scheme or system is, Is it right and just? If so found we are commanded to further it as much as possible.

* * *

Announcement reaches us of the proposed publication of a journal to be entitled the *American Journal of Psychology*, G. Stanley Hall, Ph. D., Professor of Psychology and Pedagogics in the Johns Hopkins University, will be its editor. While "the main object of the journal will be to record the progress of

scientific psychology," giving special prominence "to methods of research," articles "of unusual importance in the fields of logic, the history of philosophy, practical ethics and education will be welcomed." There will be in addition to this, digests and reviews and important papers from other journals, including translations from foreign languages, of articles of special interest. The journal will be issued quarterly at \$3.00 a year.

* * *

In one of Lilian Whittings recent Boston letters to the *Inter Ocean* of this city, speaking of the fact that Houghton, Mifflin & Co. had received from the Boston Browning Club a vote of thanks for the gift to the club of their new and exquisite edition of Browning which is printed with the greatest care from the poets own revisions of his text, says: "The errors in former publications have been numerous, and Professor Rolfe amused the society greatly yesterday by stating that he doubted not that many misprints were cherished by Browningites who mistook them for profundities or obscurities as might be."

* * *

The Society for Ethical Culture of Chicago, listened to the last of the course of weekly lectures for this season, by Mr. Salter, on Sunday, May 29. This last year has been an encouraging one for the Society, its labors having been fruitful in results. The task it has taken upon itself to perform is a noble one, and we wish it a hearty good-speed.

* * *

The American Association for the Advancement of Science will meet in New York City on August 10, and continue in session one week. This being the first meeting held in New York, a large attendance is expected. The meeting will be held in the buildings of Columbia College, and will be presided over by Professor S. P. Langley, the incoming president of the association.

* * *

We are glad to note that among the topics to be discussed at the eleventh annual meeting of the Church Congress next October, is "the higher education of women," a good sign of progress in the church, this.

* * *

THE OPEN COURT of June 9th will contain the concluding part of Dr. Montgomery's criticism of Prof. E. D. Cope's *Theology of Evolution*. In the number following Prof. Cope will reply to his critic.

* * *

The *Literary World* presents a new method of reviewing poetry:

The book has a cubic content of 117 inches; it contains 608 pages, comprises (we take the author's word for it) 300 poems, and it weighs 2 pounds 3 ounces—all for \$2, with the portrait of the author thrown in.

CORRESPONDENCE.

A LETTER FROM LONDON.

To the Editors:

Since I sent off my letter of April, Mr. Bradlaugh has tried several times to get his Oaths Bill read a second time, but new Conservative members have come forward to block the bill and join hands with the Roman Catholic, Mr. De Lisle, and the extreme Protestant, Mr. Johnston, against the Atheist.

Meanwhile, the question of oath or affirmation is constantly arising in one way or another, especially in connection with juries, where there is so much confusion of mind as to what is the law and what is not, that each magistrate decides the matter according to his own particular fancy. Some free-thinking jurors are allowed to affirm, a few take the oath, and others are not permitted to do either, but are compelled to lounge idly about the court. It is seldom that magistrates will release Freethinkers who have been summoned to serve on a jury from their service, because it is urged that then every juror would say he was a Freethinker in order to shirk a troublesome duty. Only a few days ago (on Saturday, April 23), at the Liverpool Sessions, presided over by Mr. C. H. Hopwood, Q. C., the Recorder, when the jurors were about to be sworn, one of them, Mr. W. A. Newcomb, asked to affirm instead of taking the oath, as he had been allowed to do in another court, by another magistrate, on the previous day. Questioned by the Recorder, Mr. Newcomb stated that he was a person of no religious belief, whereupon Mr. Hopwood told him that he could not accept him as a juror; someone else must be sworn in his stead. He (Mr. Hopwood) was sorry, but he could not help it; he had done his best to get the law altered. Mr. Newcomb, having said that he had no wish to shirk his responsibility as a citizen, then asked, "Am I discharged? can I leave the court?" The Recorder: "No." Mr. Newcomb: "I publicly protest against this injustice. I am here to do my duty, and cannot do it." The Recorder: "It is the law."

Some surprise has been expressed by Freethinkers here, that Mr. Hopwood, who worked so hard to get the Oaths Bill passed when he had charge of it in a previous Parliament, should not have done as many judges do, and allowed the free-thinking juror to affirm, or at least to have released him from attendance. To those, however, who know something of Mr. Hopwood, his action is perfectly explicable. The Recorder of Liverpool is a rigidly conscientious man; in his present position he is called upon to administer the law as he finds it, and whatever he conceives the law to be, that will he administer, whether he thinks the law be good or evil.

On Wednesdays, as the House of Commons rises at 6 P. M., blocking* amendments do not operate; so on the Wednesday following the incident just related, Mr. Bradlaugh tried to get his Oaths Bill through another stage. At a quarter to six the Clerk of the House called over the orders of the day, as usual. No objection was made to the Oaths Bill. The Speaker then actually put the question, "that this bill be read a second time," when some voice cried from a back bench on the government side of the House, "I object," and these two little words stopped any further progress with the bill that day.

The next day Mr. Bradlaugh asked the First Lord of the Treasury, "whether, at Liverpool City Sessions on Saturday last, the Recorder refused the oath and affirmation of W. A. Newcomb as a juror, Mr. Newcomb having applied to affirm on the ground that he was a person without religious belief; whether, on Monday, at an inquest at Wood Green, Mr. Wynne Baxter, the coroner, accepted the affirmation of Mr. Oates as a juror,

although Mr. Oates had stated that he was without religious belief; whether he is aware that similar instances of conflict, as to acceptance and rejection of affirmation by jurors without religious belief, are constantly occurring in the Queen's Bench Division of the High Court of Justice, and before coroners; and, whether, under these circumstances, the government can afford any facilities for taking the opinion of the House on the second reading of the Oaths Bill, which, during the whole of the present session, has been persistently blocked."

The First Lord of the Treasury, Mr. W. H. Smith, replied that he knew nothing of the particular cases referred to, and was not aware that instances of the same kind were constantly occurring. It was impossible, he said, for him to give consideration to any measure which was not a government measure. Mr. Bradlaugh then asked if the Right Honorable gentleman would influence the members of his party to withdraw their block from his bill, but Mr. Smith protested that he could not do this.

All, then, that is left for Mr. Bradlaugh, is to put the bill down for its second reading every time the "Orders of the Day" are a little lighter than usual, and to hope that it will be reached before half-past twelve, the hour that the block takes effect. This, of course, he will do persistently, and, if tenacity of purpose and patient perseverance count for anything, then before long we ought to see the bill through another stage.

Unlike members of Parliament, jurors and numbers of others, witnesses may affirm; the law expressly provides for this, but attaches a most obnoxious condition to the privilege. Before a witness is permitted to affirm, the magistrate is required to satisfy himself that the oath will have no binding effect on the witness's conscience. This is a very obnoxious—one might even say, insulting—condition, because an honest man will speak the truth whether "bound" by oath or by affirmation, and when the oath was the form the law required the free-thinking witness to take in order to render him legally liable for what he said, he was as much bound by it, morally, as he now is by his solemn declaration, and certainly we have no records of perjured free-thought witnesses. Christians, however, are very fond of saying that the formal acknowledgment which the law requires from every non-Christian witness, that the oath has no binding effect upon him, is an admission that when he has no choice but to take the oath, then he won't feel himself bound by it. The Christian majority first puts disabilities on the free-thinking minority, and then taunts it with them. And yet they preach, "Love one another!"

But although for a number of years, now, Freethinkers have been allowed by law to affirm in giving evidence, nevertheless there are so many cases in which their affirmation cannot be received that the judges seem in a state of great confusion on the subject. A little while ago, in the Divorce Court, a witness objected to being sworn because he was "an Agnostic." The judge, Sir James Harman, expressed himself as very doubtful as to any form under which he could take the evidence, but the clerk of the court came to the rescue, saying, "It is under Bradlaugh's Act, my lord." Whereupon Sir James Harman said, loftily, "If anyone knows how to swear this witness, let it be done." At the Middleton (Lancashire) Police Court, last week, the magistrate apparently knew nothing of the Evidence Amendment Acts or "Bradlaugh's Act," and no wiser clerk of the court coming to the rescue, illegally insisted on the administration of the oath.

A week ago died Sir John Mellor, the last of that patient triumvirate of judges who tried the Tichborne "claimant," Orton, in a case which lasted over 100 days. Sir John Mellor was a profoundly religious man, and in 1884, five years after his retirement from the bench, he published a pamphlet on the oath question, entitled, "Is the Oath of Allegiance a Profane Oath?" He began by contending that the frequent and profane use of oaths

* Last month I explained the nature of the Parliamentary "block."

is the main cause of the "existing want of reverence and awe rightfully attaching to the name of God," and regretted that—considering the excitement that prevailed, and the prejudice that had been created by the introduction of the Affirmation Bill into the House of Commons—none of the great religious bodies had troubled to discuss the oath question, and ascertain how far the fearful multiplicity of oaths was calculated to induce irreverence for the "Supreme unseen Cause." Sir John Mellor wrote: "Profoundly convinced, by a long judicial experience, of the general worthlessness of oaths, especially in cases where their falsity cannot be tested by cross-examination or be criminally punished, I have become an advocate for the abolition of oaths as the test of truth; but I would retain the punishment for false declarations wherever at present the law prescribes a penalty for a false oath. * * * An honest man's testimony will not be made more true under the sanction of an oath, and a dishonest man will only be affected by the dread of temporal punishment." The learned judge then dealt with the oath of allegiance required of every duly elected representative before he can sit and vote in Parliament. This, he said, is "an unnecessary, vain, and therefore profane oath," for since it cannot extend the duty or increase the obligation of allegiance it necessarily follows that it is a "taking of the name of God in vain." Mr. Justice Mellor wound up by saying that since in his opinion the oath of allegiance was unnecessary and profane, he would suggest that, instead of the oath, a Roll of Parliament should be made up and signed by every member upon taking his seat.

Last month lack of space prevented me from mentioning the wonderful will of the late Scotch judge, Lord Gifford, which had just then been published. I see that the will was noticed in *THE OPEN COURT* of March 31, but I must say a few words more about it here, it is of so much importance. Many and varied are the feelings and opinions to which it has given rise, but Freethinkers can have but one feeling—that of respect for and gratitude to Lord Gifford; and one opinion—that it ought to prove a most important aid to Freethought. Lord Gifford announced in his will that he was so convinced that "the true knowledge of God—that is, of the being, nature and attributes of the Infinite, of the All, of the First and the Only Cause"—is the means of "man's highest well-being," that he resolved upon founding lectureships or classes to aid in the teaching and diffusion of such true and sound knowledge. He therefore bequeathed £80,000 for the purpose of establishing a lectureship at each of the universities of Edinburgh, Glasgow, Aberdeen and St. Andrews, for "Promoting, Advancing, Teaching and Diffusing the Study of Natural Theology," in the widest sense of that term; in other words, "The Knowledge of God, the Infinite, the All, the First and Only Cause, the one and the Sole Substance, the Sole Being, the Sole Reality, and the Sole Existence, the Knowledge of his Nature and Attributes, the Knowledge of the Relations which men and the whole universe bear to Him, the Knowledge of the Nature and Foundation of Ethics or Morals, and of all Obligations and Duties thence arising."

The lectures are not to be perpetual, as they are so often in our universities, but are to be appointed for short terms, because the testator expressly desires that the thoughts of different minds should explain and illustrate the subject; the lecturers may be of any religion, or of no religion at all, provided only they be men, able and true, earnestly seeking to elucidate the truth.

Lord Gifford wished the lecturers to treat the subject as a strictly natural science, considered just as "astronomy or chemistry," nevertheless the lecturers are to be under no restraint whatever in their method of dealing with the theme, as he is 'persuaded that nothing but good can result from free discussion.' The testator desired the lectures to be public and popular, so that

not only the university students, but also the whole community, might profit by them.

Thoughtful men and women, sincere lovers of truth, can hardly do sufficient honor to the dead judge, who did not selfishly encumber posterity for all time with an endowment for the propagation of his own special views, as some men do, but who, after satisfying all private claims, leaves the remainder of his fortune to promote a free discussion on the subject nearest his heart.

The Freethinkers of the English colonies of South Africa are very desirous of forming themselves into associations and of having an experienced Freethought lecturer out there from England. They have applied to Mr. Bradlaugh to aid them to get a lecturer to go. There seems to be numbers of Freethinkers there, and they feel quite assured that there will be no difficulty in getting large audiences in such places as Port Elizabeth, Kimberley Diamond Fields, Graham's Town, Graaf-Reinet, King William's Town, Queenstown, etc. If any American lecturer would care to communicate with the secretary, the address is T. Broughton, 8 Upper Hill street, Port Elizabeth, South Africa.

It is interesting to note that at Monte Pincio, in Rome, a column to Galileo has been erected near the palace of the Medicis. It has upon it the following inscription: "The neighboring palace, once the property of the Medicis, was the prison of Galileo Galilei, guilty of having seen the earth revolve round the sun.—S. P. Q. R., LDCCLXXXVII."

May, 1887.

HYPATIA BRADLAUGH BONNER.

MIRACLES.

To the Editors:

I apply to you, or to any of your readers, for help. It is an old experience of investigators to find that somebody thought up their think long before they did. Such has more than once been my own case, and my request may probably lead me to it again. The thought this time is an argument on miracles which seems to me to be broader, deeper and more complete than Hume's, and to be conclusive, which I do not think Hume's is. And my request is that I may have pointed out to me any discussion of this argument; for I have not succeeded in finding one. This is my statement:

Hume's argument on miracles is in brief this: "Since it is always more probable that the witnesses to an alleged miracle are mistaken than that the miracle happened, the evidence for the miracle must always be weaker than that against it." This admits that there may be evidence for a miracle. My argument goes further, viz.: Evidence for a miracle not merely must be weaker than that against it, but *cannot exist at all*. This appears as follows: Evidence is matter offered by one person for the purpose of causing another person to believe. In order that this can happen, the two parties to the transaction must have had a previous common experience, for otherwise the listener has no principle or knowledge within himself for the offerer to appeal to,—nothing which can be convinced. In the case of anything capable of proof, the thing will be found to be a case falling within some previously known general rule, illustrated by some part of the past experience of life. But alleged evidence to prove a miracle not only does not fall within any such rule and experience of life, but it does not even contradict them. It is outside of them; has nothing to do with them at all; has no relation to them; in short, it is not evidence at all, because it does not appeal or apply to any common ground of experience or consciousness in the two parties to the offer, such as furnishes the only foundation or substratum of possibility for convincing and being convinced which can exist for two human minds. The offerer of such alleged evidence may believe in the genuineness of what he considers to have been an experience of his own. He may be believed by a listener who believes himself to have had a similar experience,—that is, who is

already convinced. A hearer under the influence of mere appetite for the marvelous may *believe* such a statement. But such belief is not being convinced by evidence.

Where is this point discussed? Is the argument less significant than I think it? I will add that my argument is not the same as Mill's about contradicting a complete induction. It does not require the pretty large assumption that an induction can be known to be complete; and it does not admit, as Mill's does, that the distinctive quality of evidence may exist in matter offered as proof of miracles. Both Hume and Mill admit, I believe, in terms, that miracles are not impossible, and that they may possibly be proved. I do not now deny that they are conceivable, but I do deny that, as the human mind is at present constituted, evidence to prove them can exist.

SMITH JOHN, D. D.

BOOK REVIEWS.

THE FOUNDATIONS OF ETHICS. By *Edwarde Maude, M. A.* Edited by William James, Professor of Philosophy in Harvard College. New York: Henry Holt & Co., 1887. pp. 220.

This little treatise, the work of a young man who died under thirty years of age, is introduced to the public, the editor says, not only in justice to the author's memory, "but in justice to philosophy." The aim of the work is to harmonize the various schools of ethics, which it regards as mainly right in their affirmations but wrong in most of their negations, and "fighting only because they see the shield from different sides." "Impartial minds find great difficulty in rating themselves with one or the other of the various schools, exclusively, and this because they cannot find it in their hearts to shut themselves out from the other schools for the slight causes that can be alleged." The difference between right and expediency is regarded as superficial. Duty and interest are identical. Our author does not treat ethics as the science of good and evil, or of the effects of actions, but as the science of that which merits praise or blame in character, or "the science which studies the responsibility of free beings for their actions with a view to determining for what, and how far these beings are worthy of praise or blame, reward or punishment for what they do or for what they fail to do." An act for which the actor deserves praise may produce evil effects, or one for which he deserves blame may result in good. The effects of an action in no way affect its ethical quality. Ethics cannot say "this act is good because it is useful, for that judgment must be made by some other science which has for its business the study of the effects of actions." Ethics can deal only with the subjective side of conduct. The ethical quality of an act is determined by the effort made by the actor to do that, rather than any other act. The so-called virtuous impulses, from the ethical point of view, "should be regarded exactly as the unreasoning impulses to immediate sensual pleasure are: both are unmoral; neither is *in se* vicious; neither is virtuous, so far as the actor is concerned, since he is entirely irresponsible for their existence. An act even done with good intent, but without effort of will, is not an ethical act. Neither intent nor good consequences of conduct make it virtuous. The only sin is failure to oppose obstacles by the virtuous exercise of our will. Virtue is possible only for imperfect beings. Professor C. C. Everett is quoted: "The moral law even in itself is only transitional. No action is complete so long as it is performed merely from a sense of duty." "So virtue is a mark of imperfection. The science of ethics must determine how far a man is praiseworthy or blameworthy for his acts, but this is what never can be determined and therefore a science of pure ethics is impossible. The world is or ought to be interested only in the objective effects of actions—the science of good and evil. While 'the

rightness of an act may be known innately' its goodness can be known only by experience." Such briefly is the view presented.

The novelty of the work consists chiefly in its *definitions* and *distinctions*, and here the author shows much acuteness. In making virtue to consist simply in effort of will, and an act virtuous only in proportion to the effort made to perform it, regardless of its effects, and excluding from virtue all good acts resulting from good impulses, from inherited tendencies, from a natural disposition to do right,—all acts which are performed with pleasure, however useful, the author divests virtue of about all the word connotes; and of course if ethics deals only with the energy of free volition, there can be no science of ethics. We think that most of the fallacies of this little work can be traced to the assumption of a metaphysical will, and volition that is exempt from law and causation. It seems not to have occurred to the author that volitional energy must depend upon inherited qualities, and can afford no sole ground for praise and blame.

ENTWICKELUNG UND GLÜCKSELIGKEIT. Ethische Essays von *B. Carneri*. Stuttgart, 1886. Schweizerbartsche Verlags-handlung.

This work of 470 pages is a collection of twenty-seven essays which were published before in the *Kosmos*, one of the most prominent German periodicals. All of the essays touch upon the ethical problem and such topics as are in close reference to ethics. Carneri's aim is to base ethics upon the evolution theory and Darwinism. He distinguishes ethics from morals. Morals are the historically developed ethological state of certain periods. They are different in different times, and as a rule can be formulated in a code of dictatory or imperative prescriptions. Ethics (*Sittlichkeit*) is to him morals in a wider sense. It is the abstract ideal of morals, which enables us to estimate and measure the different moral stages and views.

"Ethics," he says, "is the highest efflorescence of evolution to which humanity as it appears in the restriction of a community necessarily evolves. To ethics the pursuit of happiness naturally leads by a purification of the instinct of self-preservation."

Happiness is defined as "conscious, unchecked evolution," and "ethics is the reconciliation of individual evolution with universal evolution (*Versöhnung der individuellen Entwicklung mit der Entwicklung der Gesamtheit*). In this way the social restraint serves to enhance and purify happiness." Carneri objects to explain self-sacrifice from a happiness motive.

"Utilitarians," he says, "do violence to logic and the common usage of language; and here their whole system breaks down. Who for a noble purpose sacrifices his property and life, by no means pursues his own happiness or utility, which, indeed, he foregoes forever. Yet the pain which is caused in this way does not prevent that his sacrifice affords him a last happiness, the only one which remains possible."

"The happiness idea," Carneri says in another passage, "has its weak points, but it approaches most nearly the distinction of pleasure and displeasure, as it declares that emotion gives the first impulse. It is primarily emotion and only secondarily utility which prompts the *ego* to search for its complementary *tu*, and causes *egotism* to find full gratification in *altruism*." * * * "Emotion is the first impulse, but it is intelligence which gradually ennobles emotion." We may fairly regard Carneri's view as a reconciliation of utilitarianism with altruism. The work contains many interesting essays on different topics. He treats on Kant, Condillac, Leslie Stephen, Darwin, etc. He speaks of the "Position of Woman," "The Explanation of Consciousness," "Knowledge and Faith," "The Power of Mind," etc.

Let me conclude with the last passage of Carneri's book, where he contemplates the progress of humankind and human aspirations for the highest ideals, "The Good, the Beautiful and

the True." "There is much lacking in our civilization still," he says, "but when we review the whole past of human history without prejudice, we must confess that man has taken good care of the talent in his trust, and we may say with confidence, 'Man will never lose himself.'" P. C.

ZURY: THE MEANEST MAN IN SPRING COUNTY. A Novel of Western Life. By *Joseph Kirkland*. Boston: Houghton Mifflin & Co., 1887. pp. 538. Price \$1.50.

This is an interesting, though not an agreeable story. It is an apparently realistic description of pioneer life in the West with none of its more sordid phases glossed over, or its bitter experiences left out. The characteristics, and the successful career of Zury Prouter, the hero, are carefully drawn from the time when he first arrived in Spring County, a healthy, wide-awake, self-assertive lad, whose family and possessions journeyed thither in a "prairie schooner" and "settled" on a bit of mortgaged land, through his long life of contemptible and barely honest, niggardly meanness and bargain-making until he attains great wealth, legislative honors, and a third wife. To read this work is a much easier way to understand how some Western farmers have succeeded in amassing fortunes than to make personal experiments thereof. Fortunately the majority of our Western pioneers have never been reduced to such low moral levels as are here portrayed, but "Zury" is undeniably a strongly drawn type of a certain class, whose natural bents are warped and distorted by dire need, and degrading environments. There is a love story in this decidedly unique novel, which begins, proceeds and ends in a manner altogether original if not quite commendable. The dialogues and talk so freely scattered through the book are carried on in a strange so-called Western dialect which on the whole detracts from the interest of the story from the necessity on the part of the reader of partial translation. But whoever wishes a graphic picture of the superficial thoughts, aims and daily life as it is in small Western communities will find it in the story of "Zury," who gloried in his well-won distinction of being "the meanest man in Spring County."

AN ILLUSTRATED GRAMMAR OF SKAT, THE GERMAN GAME OF CARDS. By *Ernst Eduard Lemcke*. 2d edition, revised and greatly enlarged. New York, 1887: Westermann & Co.

Skat is considered the national German game of cards. It has been introduced into America, and it is spreading rapidly through the efforts of many enthusiastic players. No doubt the game possesses much fascination, and the author of this *Grammar of Skat* treats the subject so ingeniously that even non-players, as the writer knows from his own experience, must grow interested. To Mr. Lemcke, Skat is more than simply whiling away the idle hours of leisure. He looks upon it as an essential feature of German culture which he wants to see introduced into American social life as a cure of the Puritan ideas of Sabbath observance, etc. The origin of Skat, although it is not older than fifty or sixty years, is shrouded in myths. Its principles are quite democratic, as the knave (*der Bauer*) beats even the king. A remarkable feature of the game is that the trumping power of the cards is different from their counting value. P. C.

The Century for June presents as its frontispiece a strong portrait of Count Leo Tolstoi, and George Kennan gives an interesting sketch of a visit to that original thinker, of whom he remarks: "His theories of life and conduct seemed to me nobly generously and heroically wrong, but for the man himself I had, and could have, only the warmest respect and esteem." In the same number Julian Hawthorne writes of "College Boat Racing and the New London Regatta," which article is accompanied by spirited illustrations by W. A. Rogers. Mrs. Schuyler Van Rensselaer's description of "Peterborough Cathedral," in England, is also finely illustrated by Joseph Pennell. Some of

the portraits given this month are of Charles Sumner, Preston S. Brooks, Henry Wilson, Anson Burlingame, Dred Scott and wife, Chief Justice Taney, and Professors Moleschott, Voit and Pettenkofer.

The Unitarian Review for June opens with a paper on "The Revelations of God," as understood in the light of nineteenth century thought, by John W. Chadwick; the second article considers "A Flaw in our Town Democracies;" "St. Paul's Doctrine of the Risen Christ," by Conrad Mascol, was prepared, the editor states, by special request as a sequel to an article in the May number on "St. Paul's Doctrine of the Resurrection;" "Our Present Need," by E. F. Hayward, treats of the needs of Unitarian churches; "The Eastern Question" is interestingly explained by Prof. Boros, of the college at Koloysvár, Transylvania; "The Editor's Note-Book" in "One Phase of the Social Question" and "The Mission of Sovereigns" notices at considerable length two new books; "The Pauline Writings" are the subject considered in "Critical Theology," and George Meredith's novels in "Literary Criticism."

Wide-Awake for June is a particularly brilliant number, both in reading matter and illustration. Three chapters are given of what promises to be one of Charles Egbert Craddock's best stories, "The Story of Keodon Bluffs;" Mrs. Whitney translates some "bird talk" into verse; Harriet Prescott Spofford, in a poem, tells the sad story of "A Splendid Fire" made from the manuscripts of a disappointed poet; Louise Guiney writes of water sprites; Lizzie W. Champney begins a finely illustrated story of the Far West; Mrs. Sarah K. Bolton tells the experience of a successful woman florist, and Grace Denio Litchfield relates her thrilling experience during the earthquake at Mentone.

JAMES H. WEST, of Geneva, Ill., is about to publish *Uplifts of Heart and Will*, a book consisting of thirty-seven religious meditations or aspirations, the peculiarity of which, is that they are not addressed "to any ulterior deity," but are the expression of the emotion of the soul yearning for moral perfection.

INDIVIDUAL EXPRESSIONS.

The issues therein treated of are highly important and ably discussed.—PROF. RICHARD OWEN, New Harmony, Ind.

I think THE OPEN COURT the best publication of the kind that I have met with lately, North or South.—LEROY M. LEWIS, Monroe, La.

I am wonderfully pleased with THE OPEN COURT. It is so original and fresh that it rests one.—JOHN C. MITCHELL, Danversport, Mass.

I congratulate you upon producing a paper so excellent in every way. It will be as *The Index* was, the very Bread of Life to me.—P. B. SIBLEY, Spearfish, Dak.

If you can determine to issue THE COURT weekly, I will be glad to double my subscription. I congratulate you on its excellence.—G. P. DELAPLAINE, Madison, Wis.

When I first learned that *The Index* was about to be discontinued, I felt that I was to lose the companionship of an old friend, and was disposed to question the action of the trustees in their determination to close up the affairs of such a valuable paper. But I now feel reconciled to such action since THE OPEN COURT has come into existence, for it is a most noble inheritance that has come to continue the good work of *The Index*. I am glad to see the familiar writers once more contributing their highest and purest thought; Montgomery, Potter, Conway, Holland, Ball, Gunning. Surely these are welcome names, and beside this, you have already added other contributors who give promise of doing most excellent work. THE OPEN COURT is in every way attractive as it comes from the press, and presents a most inviting appearance even before the contents have been examined; its reconstructive work is admirable and cannot fail to command respect even from opponents, while those in sympathy with its aims and purposes look forward with increased interest to each successive issue freighted as it is with such valuable material.—C. C. STEARNS, Worcester, Mass.

The Open Court.

A FORTNIGHTLY JOURNAL,

DEVOTED TO THE WORK OF ESTABLISHING ETHICS AND RELIGION UPON A SCIENTIFIC BASIS.

VOL. I. No. 10.

CHICAGO, JUNE 23, 1887.

Three Dollars per Year.
Single Copies, 15 cts.

[The first of Prof. F. Max Müller's three lectures on the "Science of Thought," concluded in this issue, recently appeared in the *Fortnightly Review*, but not many of our readers can yet have read it in that periodical. The second, on "The Identity of Language and Thought" and the third, on the "Simplicity of Thought," not published nor to be published in England, have been secured exclusively for THE OPEN COURT, in which they will be printed from the author's manuscript. This distinguished philologist believes that language is the history of human thought, and no other man living probably is as competent as he to read this history understandingly, especially those pages which indicate how men reasoned and what they thought during the world's intellectual childhood.]

THE SIMPLICITY OF LANGUAGE.

ONE OF THREE LECTURES ON THE SCIENCE OF THOUGHT DELIVERED AT THE ROYAL INSTITUTION, LONDON, MARCH, 1878.*

BY PROF. F. MAX MÜLLER.

Part II.

No doubt English is one of the richest languages, and much of its wealth is kept only in reserve. A poet is very eloquent who uses more than ten thousand words. It is all the more amazing, therefore, to see the intellectual wealth of languages spoken by the lowest savages. Owing chiefly to Darwin's reports, it has been the fashion to represent the inhabitants of Tierra del Fuego as standing on the very lowest rung of the ladder which represents the ascent or descent of man. You remember what Darwin said of them. They seemed to him like the devils which come on the stage in such plays as the *Freischütz*. "Viewing such men," he says, "one can hardly believe that they are fellow creatures, and inhabitants of the same world. Their language, according to our notions," he adds, "scarcely deserves to be called articulate. Captain Cook has compared it to a man clearing his throat; but certainly no European ever cleared his throat with so many hoarse, guttural and clicking sounds!" These Fuegians, as they appeared to Darwin, may be responsible for much that is now called Darwinism. But even with regard to the physical features of these

Fuegians, Darwin must either have been very unlucky in the specimens he met, or he cannot have kept himself quite free from prejudice. Captain Parker Snow, in his *Two Years' Cruise off Tierra del Fuego*, speaks of the same race as without the least exaggeration really beautiful representatives of the human race. Professor Virchow, who exhibited a number of Fuegians at Berlin, strongly protested against the supposition that they were by nature an inferior race, or that they might be considered as a connecting link between ape and man. Captain Parker Snow sent me, in 1885, the following interesting letter: "I am now over sixty-seven years old"—that makes him now seventy—"but I would gladly voyage again among those so-called savages, and my wife—same age—coincides. Indeed, we have both lived among wild tribes in various parts of the globe, and never once received aught but kindness and love from them, whether in the Pacific, or Australia, or Tierra del Fuego. Nor from the days when, as a boy in 1834-5, I was much among them, and often since, have I once lifted a weapon to harm them. No occasion. I and mine found them honest, and *above* the ordinary 'civilized' lower strata of life, 'Cannibals' (when from necessity, or revenge, or policy—'to imbibe the white man's powers') though they were."

But what shall we say of their language? The same language which to Darwin's ears seemed hardly articulate is described by Giacomo Bovi, who learnt their language, as consisting of *parole dolci, piacevoli, piene di vocali*. The Yahgan dialect, which has lately been more carefully studied by missionaries, has a dictionary of 32,430 words. Now let us remember that Shakespeare, in the enormous variety of his plays, achieved all he wished to achieve, expressed all he wished to express, with 15,000 words, not quite half the wealth of the language spoken by those devils of the *Freischütz*, whom Darwin could hardly believe to be fellow creatures. Every one of these words represents an intellectual effort, and every one of them can be either declined, conjugated and compounded, according to the strict laws of a most complicated grammar.

I have always had the fullest belief in Darwin's devotion to truth, and I had expressed my conviction that, if the real facts about the language and the general character of the Fuegians were placed before him, he would withdraw the strong language which he had

* Copyright, 1887, by The Open Court Publishing Co.

used, after but a short stay among them. And so it was. In a letter, dated Down, Kent, November 22, 1881, Darwin wrote to Captain Parker Snow:

“DEAR SIR—I hope that you may succeed in publishing a new edition of your *Cruise to Tierra del Fuego*. You saw so much more of the natives than I did, that, wherever we differ, you probably are in the right. Indeed, the success of the missionary establishment there proves that I took a very erroneous view of the nature and capabilities of the Fuegians.”

That is what I call real Darwinism—love of truth, not of self or system. It is the heart that makes the true man of science, not the brain only.

What then has the science of language done for us in explaining that stupendous wealth of words and forms, whether in English, or in Sanskrit, or in Hebrew, or in Turkish, or even in the language of the so-called devils of Tierra del Fuego? It has completely changed the aspect of the miracle, and instead of exhibiting language as something incomprehensible, bewildering and supernatural, it has shown us, that the process by which this supposed miracle of language has been wrought is perfectly simple, natural and intelligible. We no longer stare at language in utter bewilderment, but we understand it. Give us the materials, and we can build up a language, perhaps more perfect, though, it may be, less beautiful, than English, Sanskrit or Fuegian.

But what are these materials?

Whatever language we take, we find that it can be analyzed, and as the result of our analysis, we find everywhere *material* and *formal* elements. In *give* and *gift*, for instance, the material element is *give*, the formal elements are *er* and *t*. In *to wit*, in *witness*, and in *wittingly*, we easily see the permanent material element, *wit*, used in the sense of knowing, and followed by such formal elements as *ness* and *ing*. These material elements are generally called roots, and it stands to reason that in modern languages it is often very difficult to discover the true roots. There have been so many phonetic changes that in order to discover the most primitive form of a root, we must always go back to the more primitive languages. The same root, *wit*, for instance, exists in English in such words also as *history*, but no one who did not know that this word came to us from Rome and Greece, would be able to discover the presence of the root *wit* in *history*. In Greek we know it, because we know that, according to fixed phonetic rules initial *v* is dropt, *d* before *t* is changed to *s*, thus giving us *istor* instead of *vid-tar*, the Sanskrit *vet-tar*.

Now this is one thing which the Science of Language has achieved. It has discovered the material elements or roots in all the Indo-European languages. But while this achievement belongs to the nineteenth century with us, it belonged to the fifth century B. C.

in India. In India the earliest grammarians asked the question, which we have asked but lately, namely, What is language made of? and they found, as we have found, that it consisted of those material elements or roots, and of a certain number of formal elements, called suffixes, prefixes and infixes. This was a wonderful achievement, particularly for men whom certain people even now would call savages or niggers. The result of this analysis or taking to pieces of the Sanskrit language is now before us, in a list of about two thousand roots, which is ascribed to the great grammarian Pāṇini, who lived about the same time as Æschylus. Given that number of roots and there is no word in Sanskrit which Hindu grammarians do not undertake to build up. That is to say, the whole flora of the Sanskrit dictionary has been traced back by them to about two thousand seeds. Wonderful as this achievement is, we must not exaggerate. Many of the etymologies of the native Indian scholars are fanciful. The idea that it should be impossible to trace any word back to a root, never entered their heads. If there is no root, a root is invented for any special word, for according to their views, the only object of a root is to account for the existence of a word. Hence many of these roots which we find collected by Pāṇini may be safely set aside. From our point of view we are quite prepared to admit that Sanskrit, like other languages, may possess words of which the roots can no longer be discovered. We could not discover, for instance, the root of such a word as *history*, if Latin and Greek had had been swept away out of existence; nor should we know that the root of *age* was *I*, to go, unless we could follow up historically the traces of that word from *age* to *eage*, *edage*, *etaticum*, *atas*, *avitas*, *avum*, and Sanskrit *eva*, which comes from the root *I*, to go.

If we sift the list of roots in Sanskrit, retaining such roots only as can be traced in the actual literature, the number of 2,000 dwindles down to about 800. That is to say, with about 800 material elements we can account for the whole verbal harvest of India. Now that harvest is as rich as that of any other of the Aryan languages, and what applies therefore to Sanskrit, applies, *mutatis mutandis*, to Greek, Latin and all the other Aryan languages. Their stock in trade is no more than about 800 roots. I should even say, it is considerably less, because as languages grow they drop a number of scarce and isolated words, and supply their wants by new derivatives, or by new metaphorical expressions. I see that Professor Skeat, in his list of the principal Aryan roots occurring in English, brings their number to no more than 461.

Imagine, then, what a difference this makes in our view of language. We may feel bewildered by a quarter of a million of descendants, but we can manage eight hundred ancestors; and if we can once manage

these eight hundred ancestors, their descendants, whatever their number, need no longer perplex and frighten us.

In this respect the Science of Language has brought daylight where all before seemed dark and confused. Whatever in language is not material is formal. These formal elements are in many cases material elements in a metamorphic state. Thus *hood* in *child-hood*, which is now a formal element, used to form collective and abstract nouns, was still not many centuries back, a living word, the Anglo-Saxon *hād*, meaning state or rank. This *hād* again is related to the Gothic *haidus*, meaning manner, way; and this *haidus* exists in Sanskrit as *ketú*, a sign. When we have come so far, we ask what is this *ketú*, and we find that its root is *kit*, to observe, to see, while *u* is a purely formal element, used to form nominal and verbal bases in Sanskrit.

Besides these metamorphic words—the soil, as it were, left by a former vegetation—the Aryan languages make use of a number of demonstrative elements, with which to form nouns, adjectives and verbs from roots. These were at first intended to point to whatever was meant to be the subject of a predicative root. If there was a root meaning to strike, then “*strike-here*” might be a striker, a fighter; “*strike-there*” might be “wound;” “*strike it*” might be “sword.” After a time these demonstrative elements became differentiated and specialized, and they stand now before us as suffixes, and terminations of nouns and verbs.

What has so far been established by the Science of Language is this, that, if we have, say, 500 material or predicative roots, and a small number of demonstrative elements given us, then, roughly speaking, the riddle of language is solved. We know what language is, what it is made of, and we are thus enabled to admire, not so much its complexity as its translucent simplicity.

There remains, however, the old question, “Whence these roots?” We have found them by careful digging, we have pulled them out of the ground, and there can be no doubt about their reality. There they are, but people want to know how they came to be there; nay, they seem more eager on that point than on the whole subsequent growth of language.

There was a time when the existence of roots was denied altogether, and words were derived straight, either from imitations of the sounds of nature, particularly the cries of birds and the shouts of animals, or from interjections, such as we utter ourselves, whether we like it or not, when under the sway of pleasure or pain, or any other powerful passion. Nothing could sound more plausible. Could the name of the *cuckoo* be anything but the imitation of the bird’s note? Could *tolderollol* be anything but a shout of joy? Do we not hear in to *chuckle* the sound of suppressed laughter, and in to *chuck* the clucking of the hen? Now to

chuckle means also to fondle, so that we can clearly see how so abstract an idea as to caress or to love may be expressed by a sound imitated straight from the cackling of a hen.

And why should not a complete language have been formed by the same process? If *bow-bow* was used for barking, why should it not be used also in the sense of persecuting? If *pooh-pooh* was an expression of disgust, why should it not be accepted as the name of a critical review? And if those who generally *bow-bow* and *pooh-pooh* moderate occasionally the breath of their indignation, or change it into a more or less loud breeze of mutual love and admiration, why should that not be called a *puff*, from which *puffer*, *puffery*, *puffiness*, and all the rest.

All this goes on swimmingly for a short time, but then comes a sudden precipice. There are onomatopœic elements in every language, but they end where real language begins. They are like volcanic rocks breaking here and there through the superincumbent stratified layers of speech. We know perfectly well what they are; they require no explanation whatever; but they are certainly not what we mean by speech, by discourse, or Logos. I had to fight these two theories when I delivered my lectures on language five-and-twenty years ago. In order to describe them by short and clear names I called them the *Bow-bow* and *Pooh-pooh* theories. Description was taken for irony; but whether these names contained truth or irony, certain it is that both these theories are now dead, never to rise again, I hope.

But though so much is gained, and we are not likely to be troubled again with derivations of words direct from the crude sounds of nature, there remains the question to be answered, namely: “What is the origin of those roots which stand like a rampart between the chaos of sounds expressive of mere feelings and the kosmos of words expressive of concepts?”

It is perfectly right to ask that question, but it is also right to see that such a question can admit of an hypothetical answer only. Think of what times we are speaking!—times when no Aryan language did exist, when no verb or noun had yet been formed, when man, in fact, was hardly yet man in the full sense of that word, but only the embryo of a man, without speech, and therefore without reason. We can enter into all the secret workings of the human mind, building up for itself the shell of language, after the materials were once given. But a state of mind without language and without reason is more than we can fully realize. All we can do is to guess, and to guess cautiously.

There are three things that have to be explained in roots, such as we find them:

(1) Their being intelligible not only to the speaker but to all who listen to him;

(2) Their having a definite body of consonants and vowels;

(3) Their expressing general concepts.

In my former lectures I called attention to the fact that everything in nature that is struck vibrates and rings. This is the widest generalisation under which the vocal utterances of man can be classed. Under the influence of certain emotions the human body finds relief in more or less musical sounds, produced by the breath passing either slowly or violently from the lungs to the larynx and from the larynx to the mouth.

This is perfectly true; but these sounds which naturally accompany our emotions, though they may supply the material, are very far as yet from being roots. It was Professor Noiré who first pointed out that roots, in order to be intelligible to others, must have been from the very first social sounds—sounds uttered by several people together. They must have been what he calls the *clamor concomitans*, uttered almost involuntarily by a whole gang engaged in a common work. Such sounds are uttered even at present by sailors rowing together, by peasants digging together, by women spinning or sewing together. They are uttered and they are understood. And not only would this *clamor concomitans* be understood by all the members of a community, but on account of its frequent repetition, it would soon assume a more definite form than belongs to the shouts of individuals, which constantly vary, according to circumstances and individual tendencies.

But the most difficult problem still remains. How did these sounds become the signs, not simply of emotions but of concepts? for we must not forget all roots are expressive of concepts. To us nothing seems more natural than a concept. We live in concepts. Everything we name, everything we reason about is conceptual. But how was the first concept formed? that is the question which the Science of Thought has to solve. At present we simply take a number of sensuous intuitions, and after describing something which they share in common, we assign a name to it, and thus get a concept. For instance, seeing the same colour in coal, ink and in a negro, we form the concept of black; or seeing white in milk, snow and chalk, we form the concept of white. In some cases a concept is a mere shadow of a number of percepts, as when we speak of oaks, beeches, and firs, as trees. But suppose we had no such names as black and white, and tree, where would our concept be?

We are speaking, however, of a period in the growth of the human mind when there existed as yet neither names nor concepts, and the question which we have to answer is, how the roots which we have discovered as the elements of language came to have a conceptual meaning. Now the fact is the majority of roots express acts, and mostly acts which men in a primitive

state of society are called upon to perform; I mean acts such as digging, plaiting, weaving, striking, throwing, binding, etc. All of these are acts of which those who perform them are *ipso facto* conscious; and as most of these acts were continuous or constantly repeated, we see in the consciousness of these repeated acts the first glimmer of conceptual thought, the first attempt to comprehend *many things as one*. Without any effort of their own the earliest framers of language found the consciousness of their own repeated acts raised into conceptual consciousness, while the sounds by which these acts were accompanied became spontaneously what we now call conceptual roots in every language.

In this manner all the requirements which roots have to fulfill are satisfied. They are necessarily intelligible to a whole community, because they refer to acts performed in common. They have a definite or articulate sound, because they have been repeated so often that all individual or dialectic variety has been eliminated; and they have become conceptual, because they express not a single accidental act, but repeated acts from which all that is purely accidental, temporal or local, has been slowly removed or abstracted.

Professor Noiré, who has most carefully analyzed this primitive process in the formation of conceptual thought, thinks that true conceptual consciousness begins only from the time when men became conscious of results, of facts and not only of acts. The mere consciousness of the acts of digging, striking, binding, does not satisfy him. Only when men perceive the results of their acts—for instance, in the hole dug, in the tree struck down, in the reeds tied together as a mat—did they, according to him, arrive at conceptual thought in language. I do not dispute this, but even if we admitted that the concepts embodied in our roots did not arrive at their full maturity till the acts which they expressed had become realized objectively by their results, we must not forget that every language retains the power of predicating these roots, and that only by that power is it able to produce its wealth of nouns and verbs.

In Sanskrit the number of these roots has been estimated at about eight hundred, and the great bulk of the Sanskrit dictionary has been traced back to these eight hundred living germs. But this is not all. If we examine these eight hundred roots more carefully, we find that they do not represent an equal number of concepts. There are, for instance, about seventeen roots, all meaning to plait, to weave, to sow, to bind, to unite; about thirty roots, all meaning to crush, to pound, to destroy, to waste, to rub, to smooth; about seventeen meaning to cut, to divide, and so on. I believe the original meaning of roots was always special, but became generalized by usage, though, on the other side, certain roots of a general meaning became specialized also.

But the important fact which has been established and can no longer be doubted is, that the eight hundred roots which supply our dictionary can be reduced to about one hundred and twenty concepts. These one hundred and twenty concepts are really the rivers that feed the whole ocean of thought and speech. There is no thought that passes through our mind, or that has passed through the minds of the greatest poets and prophets of old, that cannot directly or indirectly be derived from one of these fundamental concepts. This may seem to lower us very much. We thought ourselves so rich, and now we find that our intellectual capital is so small; not more than one hundred and twenty concepts. But does that prove that we are poor? I believe not. Nature has not become poor because we know that the infinite wealth which it displays before our eyes consists of no more than about seventy-two elements, nor is our mind poor because the elements of thought have been reduced to one hundred and twenty, and might, with some effort, be reduced to a smaller number still. What remains to us is the power of combination, of composition and decomposition; and if that power has enabled us to decipher Egyptian hieroglyphics, to determine the metals in the sun, to discover the seventy-two elements of nature, and to elicit the one hundred and twenty elements of thought, we need not be ashamed. Nature produces the greatest effects by the smallest means, and man ought to be proud to follow her example.

RELIGIOUS PROGRESS IN SCOTLAND.

BY REV. ROBERT B. DRUMMOND.

A friend sent me the other day, a copy of a sermon by Rev. Charles Voysey—the fifth of a series on Lord Gifford's Will—in which there occurs the following passage: "Edinburgh, queen of cities, is ten times more truculent [*sic*] to social opinion than London; with even more of secret unbelief and revolt from revelation, there is far more outward and insincere conformity than anywhere else that I know of. Moral courage is conspicuous by its absence. Mutual fear is the reigning spirit and the ruling motive. They do not deserve to have such a treasure, such a God-send as their *Scotsman*."

It may be necessary here to explain that Mr. Voysey has been rebuking *The Times* and commending *The Scotsman* for their respective articles on Lord Gifford's remarkable bequest of £80,000 to the Scottish universities for the establishment of free theological lectureships. *The Times* sneered at it. *The Scotsman* gave it warm welcome. Mr. Voysey continues: "It is the one gleam of intellectual and moral light in the midst of suppressed convictions and the deepest insincerity. *The Scotsman* speaks for the poor victims of social oppression and gives tongue to the thoughts of those who are afraid to speak out for themselves. Indeed, on any deep question

of religion or public morality, *The Scotsman* is at the head of all the British press, always faithful, always true, always brave; and with such a spokesman, such a leader, I am amazed at the moral cowardice which well-nigh smothered the Scottish people and stultified all their just boast of superior intelligence." This is high praise of *The Scotsman*, and it is not undeserved. But Mr. Voysey does not seem to have enough considered that even the most outspoken and independent of journals must largely reflect the public opinion which it aspires to guide, and if *The Scotsman* is one of the most powerful of newspapers it can only be because it is supported by a public which shares in its sentiments and is imbued with its spirit. But as to what Mr. Voysey says of Edinburgh society, it is very much what Mr. Buckle said, only he said it much better nearly thirty years ago. Mr. Buckle was thought at the time to have drawn an exaggerated picture, and indeed was taken to task by *The Scotsman* itself for the severity of his strictures. Undoubtedly, however, there was much justice in his remarks, and it may be that Scotland has profited by the lesson. They would be much less applicable now. Of course, there is a certain amount of truth in Mr. Voysey's censure, even still. There is, no doubt, a good deal of hypocritical conformity; a good deal of church-going for mere fashion's sake, or for the sake of relatives, sisters, wives, or maiden aunts, but there is much less of this than there was when Buckle wrote; and there is beside a geniality, a cheerfulness, a humanity in the tone of society which contrasts very pleasantly with the gloom which used to be thought essential to goodness. The old-fashioned Sabbath is now quite out of date. Perhaps the churches are still "as crowded as they were in the middle ages;" but if so, there are usually plenty of people in the parks and gardens enjoying themselves on a fine Sunday, nor is it thought any sin to scale Arthur's Seat or the glorious Blackford Hill. The very word "Sawbath," which used to be universal is now heard only from the lips of very old-fashioned people, and is generally replaced by "Sunday." Of course, there is still room for improvement, especially in the way of providing facilities for the multitude to exchange the dusty streets for the pure air of the hills or the sea-coast; but it will come. The truth is the Scotch, as a people, cling fast to their national Presbyterianism, in theory at least, the most democratic of all forms of ecclesiasticism; and they are by long custom and discipline good church-goers,—surely not a bad habit, if they find help from it, and if the help afforded is of a kind worth having. That a remarkable change, however, has taken place, of late years, in the whole tone of thought,—in the attitude of the public mind—toward the orthodox theology, and is still going on, is clear at any rate to every one living in Scotland, if not to those who only look at it from a distance.

Mr. Voysey has furnished me with a text. But I now pass from him to notice a few of the more recent evidences of the change to which I have referred. It is now a good many years since the Rev. George Gilfillan, of the United Presbyterian Church, recommended that the Westminster Confession of Faith should be laid on the historical shelf. Mr. Gilfillan was an eccentric man and a bold man, and no doubt he had no authority to speak for anyone but himself. But what would have been thought at that time if the Moderator of the Kirk of Scotland had been found claiming it as a merit, and as a proof of his conduct and forbearance, that he had never attacked the doctrine of the Confession. Yet these are the very words of Dr. Cunningham, in his address as Moderator a year ago, as reported by *The Scotsman* at the time. He says: "For myself I may say I have always asserted great liberty in my preaching, but I have never thought it right, I would have esteemed it wrong to assail or malign the doctrines of the Confession." Assail or malign it! Why, this is the Confession which every minister of the Scottish churches subscribes at his ordination, and which he is bound by the most solemn pledges to uphold and defend! Yet, here is the Moderator of the General Assembly, in the face of the whole church, boasting that he has never attacked it. A few further sentences from Dr. Cunningham's remarkable address may be quoted. "I have found," he says, "there is a vast field both outside and inside the Westminster Confession, some of it almost untrodden where the most saving truths may be gathered for the healing of a nation now so different from what it was two or three centuries ago. How different are the ideas of God and God's universe; of man, his origin, his history, and his destiny which have recently been revealed to us! These have not only modified our old theological conceptions; they may almost be said to have created a new theology." What effect these bold words may have produced in the country manses, it is of course impossible to say. Nothing could very decently be said against the Moderator, and it seems clear that he at any rate has laid the Confession of Faith on the historical shelf.

Take another point. This Gifford bequest, to which reference has already been made, is surely itself a notable sign of the times. It remains to be seen, indeed, whether the universities will accept the responsibilities proposed to be laid upon them; but there is, I think, every probability that they will. The notion of free theological teaching in the universities is not a new one. It was taken up and favorably considered, both by Professor Flint, of Edinburgh, and Professor Story, of Glasgow, at the opening of last winter session. Professor Flint had no objection to it on principle, but opposed it on the ground of expediency, remarking that as long as the churches required ministers educated in the

confessional theology, the free chairs would be starved. No one can deny that this objection has weight. It would be practically of little use to liberate the chairs of theology in the universities unless the churches were at the same time to liberate themselves. Meanwhile, even this does not look so impossible as it did only a short time back; and when we find Professor Candlish, a son of the late well-known Dr. Candlish, of the Free Church, submitting to the Glasgow Free Presbytery an overture having for its object the revision of the Confession, and carrying with him no less than thirty-seven members, against forty who voted on the other side; when we find another well-known Free Churchman, Dr. Marcus Dods, expressing doubts "whether creeds, used as terms of office, have not done more harm than good," and advocating freedom of thought as "more likely than the imposition of a creed to bring all Christendom to a common recognition of the truth," we begin to think that even in Scotland the days of the old theology may be numbered.

That perfervid Celt, as Emeritus Professor Blackie profanely called him, the Rev. Dr. MacGregor, of St. Cuthbert's church, Edinburgh, has lately been crowing over the growth of the Establishment. He says there is no doubt that the Church of Scotland is increasing year by year in numbers, and in its influence for good upon the country. This may be, but as it cannot be supposed that all the members and adherents of the Establishment are politically in favor of State-aided religion, it is only another evidence of the growth of moderate opinion. For of all the Presbyterian churches, there can be no doubt that the Established is by far the freest, the broadest, the most rational and the most progressive. The sermons preached in her pulpits may not be characterized by what can strictly be called advanced thought, though that is not altogether wanting, but it is believed there is a geniality, a breadth, a humanity about them which are not to be found, or found only in a much less degree, in those of the other Presbyterian communions. All the more, of course, is it to be regretted that she should still profess a creed which is so far from representing her real opinion and belief. Dr. MacGregor would, no doubt, be glad to see a great Presbyterian union, in which all the churches at present competing against one another should be banded together, to make one compact body strong enough to resist all the forces of unbelief, agnosticism, and whatever else is most hateful to the ecclesiastical bosom. He is not likely to see it. In the first place, whatever he may say, disestablishment will come, and, if the Irish question were disposed of, it would be even "within measurable distance." Then, if it were to come, union would be no nearer than before. There would simply be a new arrangement of elements. Affinities would be freer to act, and fresh combinations would take place. Possibly,

indeed almost certainly, the more evangelical section of the present Established Church would unite with the Free Church, and perhaps the United Presbyterians, to form a strong church on the old theological foundation. There might be a second church with a reformed confession—say the Confession of Westminster with the Calvinism left out. But almost certainly there would be a church really free—creedless, confessionless—standing on the broad ground of humanity, and wide enough to take into its motherly arms not only the Unitarian, but freethinkers of every shade, so far as they desired any union implying religion and worship. This, at least, seems to be, in the meantime, the best hope for Scotland and for the progress of free religion there.

OUR VIKING ANCESTORS, AND WHAT WE OWE TO THEM.

BY SAMUEL KNEELAND, M.D.

The popular opinion, founded on the chronicles and annals of English and French ecclesiastics, their enemies in race and religion, is that the Vikings were a set of blood-thirsty pirates and robbers, whose hands were against everybody worth plundering, and even against the successful of their own numbers—who spared neither age, sex, nor condition—who had no sense of justice, honor, or mercy—who were, in fact, to use the language of the French chroniclers, “men of hell, the spawn of the devil”—whose ravages were so constant and so terrible that this special clause was inserted in the prayer books of the ninth to the eleventh centuries, “from the rage of the Northmen, good Lord, deliver us.” Is this a just representation of them? I think not. Barbarous they were, fierce and lawless, but no more so than their opponents in that age, when might made right. One need only look over the venerable Bede, the old Saxon chronicles, and the English annals to see that the spirit of the times was inhuman, and that Saxon and Frank, Dane and Angle, were no better than the Vikings. Their work was not simply to kill and rob, but to explore, colonize, and trade; their influence is now felt in all English-speaking peoples, and the principles most dear to constitutional governments can be traced to these old Viking warriors.

Omitting the Finnish and Slavonic races (Vends), who preceded them in Scandinavia, let us begin with the historic Odin and his hordes from Scythia, who settled in Denmark and its islands, finally occupying the western shores of the Baltic—fierce pirates and robbers. The Saxons, a name given to all those roving tribes, had possession of Britain in 374, in Kent at the south, and the Orkneys and Shetlands at the north. Even in the fifth century, the Vends terrified Denmark by their extreme ferocity; but in the sixth, the Scandinavians became the stronger, and formed a kind of offensive and

defensive league against them; but they were by no means a happy and united family. According as fortune favored one party, his neighbors fell upon him for their share or the whole of his plunder; so that, while all united in ravaging Britain and the Vends, the Frisians and Jutes plundered the Saxons, the Danes the Swedes, and the Norwegians the Scanians—and all were enemies of the Finns, who were regarded as scorcerers and wizards.

On the sandy shores of Friesland and the lands bordering on the Baltic, their hordes became pirates from necessity, as the Arabs of the desert must be robbers; while the soil was unproductive, the sea was their harvest field and their camping ground; the many creeks (viks) served them for hiding places and harbors, and all their surroundings were favorable for plundering excursions, and even expeditions to distant fertile and richer shores. They were naturally seamen, from their great extent of coast line, which is the secret of their power as warriors, their wealth and intelligence as traders, and their success as bold discoverers. The Northern ocean on the west, the Baltic and the Gulf of Bothnia on the east, could not satisfy their energy and their longings; in their small but strong boats or galleys they braved the fury of the Atlantic, discovered and settled Iceland and Greenland, and planted a colony in Vinland, Mass., four centuries before Columbus saw the American shore—always, it will be noticed, maritime. As Northmen or Vikings, they controlled the northern seas from the eighth to the eleventh century, and these were principally Danes; first making voyages along the English coasts, they wintered on its southern border in the middle of the ninth century, and soon after established themselves in possession, ruling it under Sweyn, Canute and his sons, for nearly fifty years; at the same time they had their kings in Ireland, and early occupied the Orkneys, Shetlands, and Hebrides. The Danes went chiefly to England and France, the Norwegians to Scotland, Ireland, and the northern islands. The Varangians were Northmen, who with their fleets entered the Mediterranean, and ravaged in the neighborhood of Constantinople in the latter part of the ninth century, afterward forming the body guard of the Byzantine emperors. From the sixth to the ninth centuries they plundered on the coasts of France and Holland, boldly penetrating into the heart of the country, ascending the shallow rivers in their flat-bottomed boats, by day their means of conveyance, by night, drawn on shore and covered with a tent, serving as shelters. In like manner they entered Germany, Spain, Portugal, Italy, and Sicily, carrying destruction in their train. From the Norwegian Hrolf, or Rollo, the first earl of Normandy was descended, in the sixth generation, William the Conqueror, who with his Normans, French in language but Northmen in energy and bravery, found the

stoutest resistance on English soil from those of his own race.

These Vikings appeared on the coasts of Europe only for plunder, were greatly feared for their irresistible fleets, and consequently had the reputation of being the embodiment of every thing that was wicked, in the minds of their victims and enemies. Fortunately, from their Sagas this may be in a measure corrected, and we are forced, by the corroborating testimony of the finds, to admit that they were not without noble qualities, culture and refinement. They were brave, generous to a defeated enemy, eloquent speakers, wise politicians and able rulers. No doubt they committed many acts of wanton cruelty, but their robberies can be matched by the spoilers of the nineteenth century; if opposed, their raids frequently ended in foreign conquests, in which neither homes nor sacred buildings were spared. At home they passed the summer in fishing, hunting and stealing from their neighbors; the long winters they spent in carousing, listening to the songs of their bards, relating their exploits, praising real or legendary heroes, encouraging the young men to similar deeds of daring, and in planning expeditions for the coming spring.

Accustomed to the strife of the elements, and constantly warring with each other, of necessity depending on personal prowess, they became fearless, independent, self-reliant; their cardinal maxim was, "might makes right;" while rapacious, they were magnanimous; careless of the rights of others, yet fighting to the death for their own; eager to die in battle, which they regarded as a sure passport to the Valhalla, the hall of Odin's chosen warriors. Impelled by their strong will and fierce passions, energy and heroic endurance were their dominant characteristics. The young Viking was educated, like the Spartan youth, to the use of arms and a life of fighting; so great was their strength, skill and courage that at the age of twelve to fifteen years they were formidable foes. No family line was allowed, as in these days, to depend for its continuance on a sickly heir, unable to bear arms; only healthy children were, as a rule, allowed to live. The boy was of age when he could do man's work, and wield his father's sword, spear and shield. Revenge they considered a sacred duty; "blood for blood" was their law, but as they degenerated at the approach of the historic period, and became softened by Christian association, money was often accepted as the price of vengeance. They placed dependence on merit only; they knew no "blue blood," except that accident of high birth only made their responsibility the greater; they fully believed in *in blesse oblige*. They asked of their candidates for leadership, "what can you do?" or, "what have you done?"—not what did your father or grandfather do. They acknowledged nature's nobility, and not that purchasable by money, with a tainted name. Their aim was to do

something, and to do it well; it was their custom, as we know from their Sagas, at their feasts, funereal or joyful, for the warriors to make a solemn vow to perform some bold and hazardous deed, not always creditable, or die in the attempt; some of the most exciting and beautiful of these tales are the relations of these exploits—imagine a chief of Tammany, or any city hall, doing such a thing! With this barbarian character, they were fond of poetry, heroic, sentimental and historic, and it was the delight of all classes to listen to the recitals of their bards.

To sum up their characteristics—these were courage and faith to bear the hard decrees of fate, in which they firmly believed, and to fight against their enemies; independence in thought and action; regard for oaths and promises; faithfulness in friendship and love, but craft against craft; vengeance on their foes; respect for old age; hospitality, liberality and charity; temperance and cheerful content; modesty and politeness; desire for the good opinion of others, and careful treatment of the dead. All these are given in the Havamal and other Eddas, forming a code of morality which, considering the lawlessness of the times, must excite surprise and challenge admiration. Such were the characteristics of the Vikings, to whom English-speaking peoples owe many of their best traits and privileges; and yet they have been called savage barbarians, without regard to God or man, because their bravery sometimes degenerated into fierceness and cruelty, and their independence into obstinate self-will.

To these Vikings we owe public meetings for the general welfare, called "Things," invested with legislative, judicial, and executive powers, the first "Open Court," to which all freemen went as a great and sacred privilege; their sound political wisdom is shown in their laws and penalties. Public opinion was just, severe and more powerful than law in preserving the honor, integrity, and good name of these freemen. In short, we owe to these so-called northern barbarians most of what has been and is of value to man as a member of society, in Europe and America, viz.: representative government, public meetings, trial by jury (the twelve men often appealed to in the Sagas), security of property, freedom of speech and person, public opinion as a guide in politics, respect for woman, liberty of religious belief, etc. The republic of Iceland evolved the English Magna Charta, and from that the declaration of American independence, and will eventually produce universal constitutional freedom, or, to use President Lincoln's famous expression, "that government of the people, by the people, and for the people, which shall not perish from the earth."

The Norsemen raised woman to her true and equal position; she was not a slave without soul, as in the East; nor a toy, as in Greece; nor a mere housekeeper

with the keys, as in Rome; they believed that her sharper perceptive powers gave her a keener insight into divine things than the slower reasoning of man, that she was nearer to the gods and knew the future. Their ideas of her future state we know not; they had no paradise for females, pointing, as in Mohammedanism, to an Eastern origin; she would find no heaven in the Odinic Valhalla, and had to go to the lower world of Hela, with those who died of disease and in their beds—and that is about all we know.

Beside the memorials of the Vikings in the names of the first six days of the week, their fairy tales have come down to us, filled with elves, dwarfs, mermaids, nicks and nisses; many of our nursery rhymes, much of "Mother Goose," are well known to the Norse people, their originators.

They were consummate naval architects, as the finds prove; their descendants in America, mixed Danes, Anglo-Saxons and Norwegians, English-speaking all, have inherited their skill and improved upon their models. The "Puritan" and "Mayflower" are evolutions from the Norse galley, the former built for peaceful contests, the latter for war. King Olaf, Niels Juel and Tordenskjold find their modern counterparts in Nelson and Farragut; Erik the Red and Leif his son lived in spirit in Franklin, Kane, Livingstone and Stanley. The bold, free, adventurous spirit which animated the Vikings makes the English-speaking peoples the masters of the seas, whether for conquest or discovery, from the frozen ocean to the tropics, from Geenland to India and Africa.

LIVE AND NOT LET LIVE.

BY WHEELBARROW.

This is the motto of monopoly, the creed of selfishness, the religion of greed, and it makes no difference whether it is practiced by the man of millions, or by him who has no capital but his trade.

I sign my name "Wheelbarrow," because that is the implement of my handicraft, or was, when I was a strong man. I was by profession a "railroad man;" my part of the railroad business was making the roadbed, by the aid of a pick, a shovel and a wheelbarrow. I was a skilled workman, and had obtained the highest diploma that could be got in the profession. Jemmy Hill and myself worked on the same plank, and so buoyant and easy did we make the trip up and down, and dump the dirt into the exact spot, that we were worth twenty per cent. more than any other men on the job. There was a superannuated old Irishman in our "gang" who had helped in building every railroad from Montreal to Minneapolis; he had become too stiff for the wheelbarrow and the pick, and was reduced to the shovel alone, which he could still handle tolerably well; his duty was to stay on top of the pile and "level off" with the shovel. His

work was made hard or easy according to the skill of the rest. Awkward fellows would dump their loads in a dead heap, maybe a couple of feet from the place, leaving him to shovel it the rest of the way, while Jemmy and I would give the loads a flirt with the right wrist, or the left, as the case might be, and scatter the dirt on the precise location, leaving Tim nothing to do but give it a couple of taps for form's sake. One day he burst into admiration at our skill, and said, "Ye z could wheel on a horse's rib." I show this diploma, not from vanity, but as proof that I graduated with high honors in the railroad college.

You may sneer at classing dirt shoveling with "skilled labor." A hundred dollars to one that you can't wheel a 'barrow full of dirt up a plank, say at the easy incline of 30 degrees, without looking at your feet, and the same wager that you can't come down the plank, dragging the empty 'barrow behind you, without running the wheel off the track. You won't take the bet? Very well; then don't make fun of my diploma until you are able to "wheel on a horse's rib."

One day a greenhorn came along and got a job in our gang; he was awkward as a landlubber trying to climb the top-gallantmast. He would look at his feet as he went up the plank, and the wheel of the 'barrow would run off; he would look at the wheel, and his feet would step off; he asked advice, but we who had learned the trade had now become monopolists, and refused to give any instruction; all of us except Jemmy Hill; he took the fellow in hand, and showed him how to walk the plank, which he obviously had no right whatever to do. That night, up at the shanty where we lived, my tongue swaggered a good deal, to the admiration of everybody except Jemmy Hill. I gushed eloquently about the wrong done us in employing greenhorn wheelers and "plug" shovelers, and we proposed to form ourselves into a "brotherhood" to protect ourselves against monopoly, and especially making it a capital offense for one of the "brotherhood" to teach a fellow-creature how to wheel a 'barrow full of dirt up a plank.

The next day was Sunday, and Jemmy and I took a walk to a favorite spot where we used to smoke our pipes and gossip. The glorious St. Lawrence rolled at our feet, and the sun shone bright overhead. Jemmy was a young fellow from the North of Ireland, about five feet nine or ten, slim, all sinew and bone, blue eyes, light hair, and a fair, smooth face, beautiful as a girl's. He had a soft, musical voice, and there was nothing manly about him, except that he liked to smoke; but he was brave as Phil. Sheridan; he was a holy terror in a fight; I saw him scatter a dozen fellows once in a riot, like Samson used to clear out those Philistines. He is president of a railroad now, and rides in his own special car, in which there is always a welcome berth for me.

We talked about the necessity of protecting our

craft from "plug" workmen, or, rather, I did; Jemmy merely smoked his pipe and listened. At last he pulled out of his pocket a watch-charm, and handed it to me to examine. The crest on it was a couple of torches, one lighting the other, with this motto underneath: "My light is none the less for lighting my neighbor." He explained that this was the motto of some secret society that he belonged to in Belfast; I forget the name of it now, but no matter, that was the motto of it, "My light is none the less for lighting my neighbor." I accepted the rebuke, and acknowledged that the motto was a good one. That was many years ago, but the longer I live the more I am convinced that it is sound in political science and social economy. It is the very antithesis of the narrow principle, "Live and not let live."

I commend it to workmen the world over; the practice of it will make them better, happier and richer than the other principle, which cannot become general without reducing the world to barbarism. Had this been the motto of the telegraph brotherhood it might have saved them the humiliation of "signing the document," it might have spared them the necessity of the strike, and even in their failure it would have secured to them the sympathy of all men whose good opinion was worth having. How can we sympathize with men in a struggle with monopoly who themselves seek to become monopolists of the knowledge that earns bread, who in the very charter of their order pledge themselves to one another never to teach their trade, and who seek to control the free action of their brother craftsmen? Men who would enslave others easily become slaves, and the telegraphers who left their keys free men and proud returned to them in a month with their liberty signed away. George Stephenson, the greatest engineer of modern times, or perhaps of any time, was refused admission into the "order" of engineers because he was a "plug," who had never served an apprenticeship. The men who did that would have deprived him of his genius if they could, although that genius has multiplied the comforts of man a hundred or a thousand fold.

Men are interested not in the downfall, but in the upraising of one another; not in the poverty of any, but in the riches of all; not in the ignorance of a part, but in the intelligence and wisdom of the whole. The contrary principle impairs the symmetry of the moral universe, whose laws are perfect and harmonious as the laws which govern matter. Every man is interested in the welfare and prosperity of every other man; none can suffer loss without all sharing in it. I cannot show you where I lost a penny by the great Chicago fire, and yet I know that two or three hundred million dollars worth of property could not be blotted out of existence without my losing something somewhere. I cannot show you that I lost a dollar by the Franco-German war, and

yet I know that two great nations cannot destroy tens of thousands of each other's men, and tens of millions of each other's property without my losing something. This world of ours is a small world, and no part of it is so remote from me that people can suffer loss without my sharing in that loss; and conversely, mankind can not grow richer and leave me poorer, nor wiser and leave me ignorant, nor better and leave me worse. That is my religion, and, in the language of Ingersoll, "Upon that rock I stand."

THE CROSS OF THE NEW CRUSADE.

BY PROF. VAN BUREN DENSLOW.

The old crusades were a brutal outgrowth of superstitious ignorance and religiously insane stupidity. There was nothing respectable about them save the persistency with which the nature of things wrecked them. They were the greatest waste of motive, blood and effort ever made in history and the most effectual lesson going to prove that it is when men mean to be the establishers of righteousness and the special patrons and protectors of God that they most nearly lose their reason and commit their most hardened and atrocious crimes.

Men, therefore, are not to be either trusted or respected merely because they move in considerable masses toward the attainment of any result. On the contrary sanity and soberness, as often as the crowd are seized by some epidemic of unreason retire their possessors from influence, while a falling in with the craze of the hour, or becoming the craziest man in the craze, leads to fame and even to fortune.

The craze of the present hour is the attempted cross between political economy and religion, known as anti-povertyism, which like the cross between the white and black races, brings out into conspicuous relief the worst qualities of both parents and the good qualities of neither. Political economy has always consisted of sensations produced by assaults upon common sense, and religion has maintained its good name by making its promises redeemable in a future state from whence, if they are not redeemed, no notice of protest ever gets back to the endorser. The anti-poverty creed is economic in that it attacks common sense savagely. It is religious in that it makes no promises which can come back to torment those who issue them until, like the Yankee clock-seller in Georgia, they have had time to provide a new clock in place of the one that "wont go." Like religion it promises a heaven to its disciples, but differs from most religions in making heaven consist of real estate in this world instead of harps and timbrels in the next. Instead of telling its devotees they shall in another world "inherit the earth," it assures them the real estate is now theirs, but must be recovered by ejection of its present possessors. Instead of taking out a writ of ejection from the courts, however, they are to apply to the legislature

to take them out somewhat as woodchucks who can't be hounded out of their holes are smoked out. Anti-povertyism is a long name for what the early saints called the worship of Mammon, or the new golden calf on wheels. It resembles its father, political economy, in two things. It resists assault by creating a smudge of obscure smoke which makes the eyes sore to peer through, and which none but the very dull can see through at all. And it teaches that we are saved by wealth and not by faith. It resembles its mother, religion, in holding that wealth is given by the grace of God and that it ought to be so possessed by all, that it would cease to buy the services of any. The highest utility of wealth it thinks will be attained only when none will seek to possess it. True, it will then have lost all purchasing power, but it will be every man's comfort to know, as in the case of Confederate notes, it is easy to get hold of a large supply. No name could fit so well this hybrid between religion and the philosophy of pelf as that of "The Cross of the New Crusade."

The crusaders of the middle ages could see nothing obscure or doubtful in the platform that if the world was ever to be made happy it must be by rescuing the possession of a rock in Judea in which a Jewish prophet had been buried, out of the possession of certain gentlemen of the Unitarian persuasion and Saracen extraction who had failed to discover that this Jewish prophet was the creator of the universe. To them the proposition that taxing the Saracens out of existence would diffuse sweet peace in every pious breast was too plain to need argument. What good thing could men possibly lack when the sepulcher of Jesus was again possessed by Christians? So to George and McGlynn it is clearer than day that to prevent any man from acquiring a home, by precluding all private title to a home, will give homes to all the homeless, and make all persons the permanent and happy possessors of that which each person is precluded from permanently and happily possessing.

"Ah, but," say these real estate Christs, "you must state our gospel in our own language. We will not be responsible for any definition of our principles which we do not coin ourselves. We tell you that under the new socialistic state to be arrived at by taxing all ground rents until no man shall remain entitled to a ground rent, there will be the greatest possible disposition on the part of all owners of land to improve the land. Only by improving the land can they get a rent at all. Rent will accrue only on the improvements and not on the land."

The rental of improved lands is thus made to be brought into court, like the baby before Solomon, to be cut in two to determine how much of its life shall be bled away in behalf of the improver and how much of it shall be drank up by the sand to appease the demands of the State. It is forgotten that any such

metaphysical division of rents destroys rents. It is like cutting away in a man the portion derived from vegetable from the part derived from animal food. When the knife enters to make the dissection the soul goes out and there is no man. Land can not be improved, and rents can not exist, where the moment a value is created in land it is confiscated. For in principle the theory might as well be applied to all forms of personal property. We might as well divide the total value of the table or chair between the portion of value that inheres in the wood of which it is made and the part that is derived from labor. The wood before its severance from its trunk was part of the land; hence, according to George, it was created by God. Hence, it belongs to the State. Hence, it is only by an act of robbery and spoliation "exploited" into private ownership. Only the portion of value which is derived from labor may justly belong to its possessor. So we might divide the house, the watch or the piano, between God as the source of the raw materials or constituent properties, and man as the source of certain labor rendered thereon. Giving the former to the State, all private title to personal property of every kind, as well as real, would be resolved into spoliation and plunder. Thus may a fine theological subtlety be lugged into the real estate business, and the question whether land which I have paid for belongs to you or me can be determined by a series of casuistries concerning God, whom neither of us knows anything about or has any facilities whereby we can learn anything about him. Meanwhile property becomes blasphemy according to this fine phrenzy, and the man who saves is thrust behind bars as being the man who steals. The complainant in the case is God, and the fact that God enters the complaint is certified to by the strong assurance afforded by human cheek, gall, brass, presumption and impudence. It may be in vain to hope to dispel this idiocy, as all idiocy is without cure, but chiefly the idiocy that has the power to rant and breed ranters. Still the unstricken will see that ground rent means a payment for the use of desirable space. It is not a thing which can be either taxed out of existence or owned by the State, even in the most paralyzed and savage conditions of society.

When George and McGlynn themselves hold a meeting, they bring into existence the very element which they say they meet to tax out of existence, viz., ground rent. In the very Academy of Music, wherein they meet, at fifteen minutes before their time of meeting but in consequence of their anticipated meeting, every seat in the Academy becomes the subject of a ground rent. This gate fee is a money-value which purchasers will pay for a certain space in consequence of its contiguity to a part of the societary movement. The societary movement in this case is the attraction presented by the combined presence of a pretended

economist peddling a new kind of heaven, and a popular priest vouching for a new fiction in economic imposture. Both are promising certain social sugar-plums which they will never deliver. Notwithstanding the promise is a swindle it confers a money value on the seats. It creates an active competition for their possession. This economic value is rent. Let the government now exact that Henry George and Dr. McGlynn shall show how much of this ground rent is due to the labor which constructed the seats and how much is due to the societary movement that attracted the crowd. It would be like showing how much of the rose is due to the sun and how much to the soil. In default of their being able to make this impossible metaphysical division in relation to this physical fact let the government of course take the whole rent as a penalty for the imposture. On these terms George and McGlynn would not hold the meeting. Their ground rents, gate fees, contributions, or what you will, would be taxed out of existence, but pursuant to their own theory. They would be hoisted by their own petard.

Where two concurrent conditions must both cooperate before any fact can exist there can be no division between these conditions to ascertain the degree in which each contributes to the result. To do so would be to measure the immeasurable and to set prescribed bounds to the absolute. Each contributes *in whole*, not in part, to the result, and to borrow the form of a certain legal phrase, the effect is seized of each as its entire cause and not of either as a separate and distinct part of its cause.

The attempt to divide that portion of the values of land which accrue from the labor of its possessors from that portion which accrue from the societary movement is like an attempt to divide the body of a child between his two parents; the division destroys its subject. Tax George's meeting to the full value of the seats, whether in gate fees or contributions, and there will be no meetings of George's disciples. Apply his doctrine to himself and he would be instantly deprived of the power to advocate it.

I would suggest, therefore, to our legislatures and city councils to be passed and enforced either as a statute or a city ordinance the following concise law:

BE IT ENACTED, That

1. WHEREAS, a party favors the abolition of ground rents, and
2. WHEREAS, this party holds meetings, which are sustained by the ground rents of seats therein, collected either in the form of an admission fee at the door or of voluntary contributions; and
3. WHEREAS, this party believes the world will be made happy by confiscating all ground rents in whatever form to the State, and
4. WHEREAS, the State concurs in this opinion so far as respects the ground rents of all meetings held explicitly to abolish ground rents, and
5. WHEREAS, there can be no direction in which to begin to apply a new and benevolent principle which will be so just or appropriate as to apply it first to those who are the first to desire its application, therefore

IT IS ENACTED, That the admission fees and contributions taken in all meetings held by any party having in view the advocacy of the abolition of ground rents shall be collected by the police only, and shall be paid into the city and State treasuries exclusively for the maintenance of such of the insane as shall be deprived of their usefulness to society through their mental incapacity to withstand the seductive flattery with which Henry George seeks to persuade every

man who fails to acquire property that the reason he has not acquired it is because he has been robbed of it by the man who has.

This would prove the George-McGlynn medicine by observing its symptoms when applied to the doctors who prescribe it. It is well known that many physicians prove their medicines by first taking them themselves. It is not uncommon to meet doctors who have been so unfortunate in their sincerity as to follow this practice. But it is extremely uncommon to continue to meet them long. They follow so soon in the long procession of their patients.

If our legislatures and city councils will only commend Henry George's chalice to his own lips, and if he thrives on it I do not doubt that all other receivers of ground rents, whether for long or short terms, will stand ready to drink from the same cup.

Meanwhile, might it not be well for the new crusaders to inquire whether it was the sepulcher of buried superstitions at Jerusalem that emancipated the laborer from his lord, or whether it was not the iron and steel furnaces at Damascus. Was it the ignorant Christians who left their huts and caves in Europe to carry the sword into Judea that were truly noble in their work or was it the Turks who responded to slaughter with the gifts of tea, cotton, the loom, mathematics and science.

Doubtless under the iniquities of the crusades some stray flower of utility or beauty may have bloomed. But the crusades in bulk were a dead cataract of human hate—a prolonged Niagara of social insanity—equally fatal to the life that stood under and the life that came over. Ignorance only can inspire the furious zealots who suppose a revival of their spirit can do good.

TH. RIBOT ON MEMORY.*

BY DR. PAUL CARUS.

Memory, as generally understood, is the outcome of a long evolution; as such it is first a *biological* fact, and only secondarily a *psychological* fact. In other words, *consciousness is not an entity, but an incidental phenomenon*. Certain nervous processes are accompanied by consciousness.

Memory, in the usual sense, comprises three things:

1. The *conservation* of certain states—we would prefer to call it *forms*, which perhaps is a more precise expression than the French word *état*;—2. Their *reproduction*;
3. Their *localization* in the past. The last point makes memory perfect; at this stage it is commonly called *recollection*. The first two are indispensable and, as a rule, stable. The third element, which is purely psychological, is unstable; it appears and disappears; it represents the range of consciousness in the realm of memory, and nothing more.

*I present in the following sketches Th. Ribot's views of the most important psychological problems, and begin with *Memory*, where the famous French scientist follows the trail of his German contemporary, Professor Ewald Hering. Ribot's method, which is employed in many cases very successfully, is to get at a right understanding of evolution by studying the inverse process, viz., *dissolution* as it is exhibited in different morbid states. As I am anxious to present Ribot's views, and not my opinion on his views, I shall be careful to retain, wherever possible, Ribot's own expressions.

Reflex actions, if often repeated, grow automatic with all their associations. Without seeking for extraordinary illustrations, we find in every-day life long chains of organic, complex, and carefully determined acts, whose links, all differing from one another, follow in a constant order; for example, the ascent and descent of a staircase which we have often used. Our psychological or conscious memory is ignorant of the number of steps; but the organic, or unconscious, memory is familiar with them as well as the number of flights, the arrangement of the landings, and other details; it is not easily deceived.

The conservation and reproduction of such nervous actions are independent of consciousness. *Trousseau*, in his *Leçons Cliniques* (II, 41-2), reports the following case: "A musician who played the violin in an orchestra, was frequently seized with momentary loss of consciousness during a musical performance. But he continued to play, and kept time, although remaining in absolute ignorance of his surroundings. He neither saw nor heard those whom he accompanied." From such cases we learn that consciousness has its own peculiar sphere. We have to reduce the part it plays to proper proportions. The sudden absence of consciousness proves it to be nothing short of an additional element in the mechanism of memory.

The question as to the seat of memory can give no room for serious controversy. The law, as formulated by Bain, is that the renewed impression occupies exactly the same parts as the original impression. It is impossible to say in what the modification of the nervous substance consists. Neither the microscope, nor re-agents, nor histology, nor histo-chemistry can reveal it; but facts and reason indicate that a modification takes place, when sensations or movements are recorded in nervous tissue. A rich and well equipped memory is not a collection of imprints but an arrangement (*un ensemble*) of dynamical associations very stable and very ready for resuscitation.

Memory, accompanied by consciousness, is a more complex form than automatic memory, for every physical action presupposes a nervous action, but the reverse is by no means true. *If we consider consciousness as an essence, or a fundamental property of the mind, all is obscure; if we consider it as a phenomenon having its own conditions of existence, all becomes clear.* This understood, unconscious activity loses its mysterious character and is explained with the greatest ease.

One example may serve for many to show how noiselessly unconscious cerebration does its work. Carpenter in his *Mental Physiology* relates among other similar cases: "A mathematician was occupied with a geometrical problem the solution of which he failed to obtain after a number of trials. Several years later the correct solution flashed upon his mind so suddenly that

he trembled as if another person had communicated to him his own secret."

The nervous system is traversed by continuous discharges. Among these nervous actions some respond to the unceasing harmonious activity of the vital functions; others, fewer in number to the succession of states of consciousness; still others, by far the most numerous to unconscious cerebration. Six hundred million cells and four or five thousand million fibers, even deducting those in repose or which remain inactive during a lifetime, offer a sufficient contingent of active elements. The brain is like a laboratory full of movement, where thousands of occupations are going on at once. Unconscious cerebration may act in several directions at the same moment. *Consciousness is the narrow gate through which a very small part of all this work makes its appearance.*

The psycho-physiological residue of memory which is produced in our nerves by recording perceptions and sensations may be styled with Wundt a *disposition*. He says in his *Grundzüge der Philosophischen Psychologie*: "The eye, each day comparing and measuring distances and relations in space, gains more and more in precision. The consecutive image is an imprint; the accommodation of the eye, its faculty of measurement, is a functional *disposition*. It may be that, in the case of the unexercised eye, the retina and the muscles are constituted the same as in the exercised organ, but there is in the second a *disposition* much more marked than in the first."

Each of us has in his consciousness a certain number of recollections: images of men, animals, cities, countries, facts of history, or science or language. These recollections come back to us in the form of a more or less extended series of associations. Take as one of these terms the memory of an apple. According to the verdict of consciousness, this is a simple fact. Physiology shows that this verdict is an illusion. The memory of an apple is necessarily a weakened form of the perception of an apple. What does this perception suppose? A modification of the complex structure of the retina, transmission by the optic nerve through the corpora geniculata and the tubercula quadrigemina, then through the white substance to the cortex. This presupposes the activity of many widely separated elements. But this is by no means all. It is not a question of a simple sensation of color. We see, or imagine, the apple as a solid object having a spherical form. These conceptions result from the exquisite muscular sensibility of our visual apparatus and from its movements. Now, the movements of the eye are regulated by several nerves, viz., the sympathetic, the oculo-motor and its branches. Each of these nerves has its own termination, and is connected by a devious course with the outer cerebral layer, where the motor intuitions, according to Maudsley, are formed. We simply indicate outlines and give an idea

of the prodigious number of nervous filaments and distinct communities of cells scattered through the different parts of the cerebro-spinal axis, which serve as a basis for the psychical state known as the memory of an apple, and which the double illusion of consciousness and language leads us to consider as a simple fact. Visual perception is more complex still, and if we take a spoken word the complexity is equally great. Articulate language supposes the intervention of the larynx, the pharynx, the lips, the nasal fossa, and, consequently, of many nerves having centers in different parts of the brain, viz., the spinal, the facial, and the hypoglossal nerves. If we include auditory impressions in the memory of words, the complication is greater still. This shows the importance of the associations which Mr. Ribot calls the *dynamic* bases of memory, the modifications impressed upon the elements being *static* bases.

The static bases produce those untraceable changes of the nervous substance which are marked by the different dispositions. They modify the forms of the nervous cells in some way or other. The dynamic bases are the anatomical conditions of what is called in psychology association of ideas; they form combinations which connect certain parts of the brain; if one nervous cell is irritated, many others, being in communication with it are also called into action.

When we begin to talk, we use first simple words; later, isolated phrases. For a long time we do not realize that these words are made up of simple elements; many are always ignorant of the fact. Forbes Winslow (*On the Obscure Diseases of the Brain and Disorders of the Mind*. Fourth edition, p. 257.) cites the case of a soldier who was trepanned, losing in the operation some portion of the brain. He forgot the numbers five and seven, and was not able to recollect them for a considerable time. There is another more curious fact: "A man of scholastic attainments lost, after an attack of acute fever, all knowledge of the letter F."

The psychical memory constitutes the most complex, the highest and most unstable form of memory. This is generally called recollection. Ribot calls it *localization in time*. The explanation of localization in time starts with the law, that imaginary acts are always accompanied by the belief (at least for the moment) in the existence of the corresponding reality. This illusion, which exists in the highest degree in hallucination and dreams, also exists, although in a less degree, in all states of consciousness, which in reality are purely mental perceptions.

I shall not attempt to determine, says Ribot, whether memory is a postulate of the idea of time, or whether the idea of time is a postulate of memory; certainly time implies memory, and memory implies time.

We determine position in time as we determine position in space by reference to a fixed point, which,

in the case of time, is the present. It must be observed that the present is a real existence, which has a given duration. However brief it may be, it is not, as the language of metaphor would lead us to believe, a flash, a nothing, an abstraction analogous to a mathematical point. It has a beginning and an end. But its beginning does not appear to us as an absolute beginning. It touches upon something with which it forms a continuity. When we read or hear a sentence, for example, at the commencement of the fifth word something of the fourth still remains. Each state of consciousness is only progressively effaced; it leaves an evanescent trace, similar to that which, in the physiology of sight, is called after-sensation; hence the end of the fourth word impinges upon the beginning of the fifth. It is evident that the retrogressive transition exists as well between the fourth word and the third, and the sum of the duration of many will give the position of any state whatever with reference to the present or its distance in time.

Our way of localization is facilitated by the use of reference points. I understand by a reference point an event, a state of consciousness, whose position in time we know—that is to say, its distance from the present moment, and by which we can measure other distances. These reference points are states of consciousness which, through their intensity, are able to survive oblivion, or, through their complexity, are of a nature to sustain many relations and to augment the chances of resuscitation. They are not arbitrarily chosen; they obtrude upon us. Their value is entirely relative. They are for an hour, a day, a week, a month; then, no longer used, they are forgotten. They have, as a rule, a distinct individuality; some of them are common to a family, a society or a nation. These reference points are like mile-stones or guide-posts placed along the route. The intermediate terms disappear from our recollection because they are useless.

The process of remembering is abbreviated by elimination. If to reach a distant recollection it were necessary to traverse the entire series of intervening terms, memory would be impossible because of the length of time required for the operation. Abercrombie furnishes a proof: "The late Dr. Leyden was remarkable for his memory. I am informed, through a gentleman who was intimately acquainted with him, that he could repeat correctly a long act of parliament, or any similar document, after having once read it. When he was, on some occasion, congratulated by a friend for his remarkable power in this respect, he replied that, instead of an advantage, it was often a source of great inconvenience. This he explained by saying that, when he wished to recollect a particular point in anything which he had read, he could do it only by repeating to himself

the whole from the commencement till he reached the point which he wished to recall."

We learn from this that one condition of memory is forgetfulness, and we discover here a striking analogy between two essential vital processes. To live is to acquire and lose; life consists of dissolution as well as assimilation and forgetfulness is dissolution of memory.

Recollection is not possible if its localization is missing. Toward the close of his life Linnaeus took great pleasure in perusing his own books, and when reading would cry out, forgetting that he was the author, "How beautiful! What would I not give to have written that!" Walter Scott, as he grew old, was subject to similar forgetfulness. One day some one recited in his presence a poem which pleased him much; he asked the author's name; it was a canto from his *Pirate*. A much more instructive instance is recorded by Macaulay in his essay on *Wycherley*, whose memory in his declining years, he tells us, was "at once preternaturally strong and preternaturally weak." If anything was read to him at night, he awoke the next morning with a mind overflowing with the thoughts and expressions heard the night before, and he wrote them down with the best faith in the world, not doubting that they were his own. That in this instance the mechanism of memory was dis severed, pathology proves plainly by analysis. Interpreting the case according to principles already laid down, we should say: The modification impressed upon the cerebral cells was persistent; the dynamical associations of the nervous elements were stable; the state of consciousness connected with each was evolved; these states of consciousness were re-associated and constituted a series of ideas and phrases. Then the mental operation was suddenly arrested. The series aroused no secondary state; they remained isolated and were not connected with the present, so that they could not be located in time. They remained in the condition of illusions; they seemed to be new because no concomitant state impressed upon them the imprint of the past.

Cells have the power of self-nourishment and are endowed, at least during a portion of life, with the faculty of reproduction. Physiologists are agreed that this reproduction is only one form of nutrition; the basis of memory is, therefore, nutrition; that is to say, the vital process *par excellence*.

ALL LAWS IN HARMONY.

BY MRS. R. F. BAXTER.

Are there any laws governing this universe or its inhabitants that conflict with each other?

There are those which keep the stars and the comets in their orbits, and produce the inflowing and outflowing of the tides; others that cause the water from ocean, lake and river to rise, and fall again in rain and vapor. Each organism and each function has its laws by which

its actions are determined. Whether disobeyed knowingly or ignorantly the penalty is the same. Nature is inexorable and always declares, I will have my pay. And there are the laws of heredity; of the adaptation of certain kinds of food to the wants of the physical system to sustain its vitality; another that certain kinds of vegetable and animal productions are poisonous. To these we may add mental, moral and spiritual laws, which obeyed will insure development in every direction; if neglected or violated, will produce the opposite effect.

We must necessarily believe that all these laws and countless others, have the same basis and conduce to the highest good. But there is a rapidly increasing class who maintain that all laws governing the health and the disease of the body can be ignored entirely, and that these disorders of the physical system, caused by the violation of laws relating to them, do not exist; that if one only think they do not, he will be free from pain and the consequences of breaking the edicts of his physical nature.

Carry this belief to its extent, and it follows of course, if *true*, that if you put your hand into the fire it will not be burned, if you eat poison you will not suffer therefrom. Imagination, it is true, has a great effect. Every scientific person will admit this; but not that it will work miracles, will not set a broken bone or create a new heart or lungs. By its power in accordance *with its own laws* it will assist nature in the work of eradicating disease, particularly that of the nervous system. There is a magnetic power in the presence of a strong will or cheerful physician which will divert the mind of a sick person from dwelling constantly on his condition. Many doctors and nurses understanding this *law*, always have a mirthful story to tell their patients, and frequently keep a stock on hand for this purpose. I have often heard women say of such professors of the art of healing, "The sight of him, with his firm, strong step, and smiling face, makes me feel better immediately."

These men or women do not say to an invalid, "Nothing ails you, you are not sick, you only think you are." The salutary effect of their presence is in accordance with a well known law. There is a restoring influence emanating from the aura of a good, strong, healthy person—a magnetic current which one weaker physically and mentally receives.

But suppose a person attacked with some zymotic or filth disease, like typhoid fever, or diphtheria, should call in medical aid and it should be said to him, "Nothing is the matter with you, you only imagine you are sick," what would be the result? The intelligent physician, while relying often upon other aids beside medicine in many cases, in such an instance while administering remedies which his experience has found efficacious, and insisting on proper diet, pure air and entire separation

from others, immediately proceeds to investigate the premises and to search for the origin of the malady, which is often found in defective drainage, plumbing or other conditions favorable to the production of this form of disease.

That there are sometimes cures *apparently* affected by "Christian Scientists," as they term themselves, I do not deny. We hear of them, but not of the many failures. If there are real cures they must be in accordance with laws these professors do not understand. All the capabilities of humanity are not yet discovered. When that time comes we may be assured that there will be no conflict between any laws created by unerring wisdom. In the future when the progress of the knowledge of sanitary measures and other right conditions of living shall have become universal, a time may arrive when such observance of these laws will have entirely obliterated epidemics, and all contagious diseases from the earth, as is confidently predicted by our most eminent scientists.

In the meantime we ought to have our feet firmly planted on the truths of science already discovered, and wait patiently for those yet to be made known, for every step forward is one upward, and we may look to the future assured that all laws are divine and that, as expressed by that true poet of nature, Walt Whitman: "The indirect is as much as the direct. The spirit receives from the body as much as it gives to the body, if not more." "There is but one form, one spirit in the universe, but its different manifestations or channels of operating are countless."

In this age when immense fortunes are acquired by the manufacture of patent medicines that pretend to cure every ill which "flesh is heir to;" when quackery with unblushing effrontery advertises its nostrums in every daily paper; when medical colleges, so-styled, are sending out their hundreds of graduates armed with their diplomas, to deceive the ignorant and credulous and to encourage impurity and vice, it is incumbent on all interested in the elevation of humanity to investigate every theory and method which claims to cure disease by simply ignoring its existence, and the conditions which have caused and serve to perpetuate it.

The chain of cause and effect runs through all the phenomena of nature, visible or invisible, from the stars too far distant to be detected by any telescope yet invented, down to organisms too minute to be seen by the most powerful microscope. To investigate the operations of this universal law and place ourselves in harmonious relations with it, is the one and only way to insure the highest health and success of which humanity is capable. Upon it depends the destiny of nations as well as of individuals. Until this truth is recognized and all reforms for the renovation of the world based upon it, entirely fruitless will be the attempts, although they

may be honestly and sincerely made, to produce the desired result. Too late it will be discovered that their fancied panaceas are founded, not on the immovable rock of knowledge of the laws of harmony to whose music every movement in the universe keeps time, but on the sifting sands of visionary sentimentalism or vague speculation.

The majority of people when they name the so-called properties of matter never doubt that they are describing an external substance as it exists *per se*, instead of the different ways in which they are affected by a reality of whose ultimate nature they know nothing. Tell them that weight, resistance, extension, etc., describe the *effects* on us of an external reality rather than the reality itself, and they are utterly unable to comprehend what you mean. It is none the less true that mind and matter form a synthesis. The hardness and softness (resistance), for example, which we ascribed to matter are sensations. Every perception, every sensation, implies a sensitive organism and an external reality acting upon it. This is evidently what Aristotle meant when he described sensation as the "common act of the feeling and the felt." Without the living organism what are sound, color, fragrance, hardness, softness, light, and darkness, or any of the so-called secondary, not to speak here of the so-called primary qualities of matter. Can there be sound without an ear to collect and transmit the aerial vibrations to the acoustic nerve, where (to use a materialistic terminology) they can be transformed by some mysterious process into sensation? Without an eye there can be no luminous effect. There must be both vibrations of the air and an acoustic nerve to have sound, undulations of ether and retinal sensibility to have light, emanations of particles and an olfactory nerve to have fragrance, and external objects and nervous sensibility to have hardness or softness. Vibrations of the air, undulations of ether, emanation of particles and external objects may all exist in the absence of an organism; but what are sound and luminousness, fragrance and hardness, but sensations? And of the external factors mentioned what do we know, except in connection with the subjective factors? By psychological analysis our conceptions of matter are reducible to sensation, "the common act of the feeling and the felt," and this is what Fénelon meant when he said of matter, "It is a *je ne sais quoi* which melts within my hand as soon as I press it."

Says the Indianapolis *Iron Clad Age*:

Science is a fabric evolved from a series of ascertained facts, which facts may be logically used as mirrors to reflect the images of inferential facts whose reality is beyond the ken of our senses. But theology can have no scientific basis, for its retrospect is a rayless wilderness where all is hushed save the faint echoes of dreams and fables and its perspective an imaginary region where faith is the only occupant, and where logical fact labors in vain for a foothold.

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixon Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of THE OPEN COURT is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption or any limitations of possible knowledge, except such as the conduct of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to THE OPEN COURT should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, JUNE 23, 1887.

THE MENTAL HEALING CRAZE.

Boston papers state that the "mental healing" craze which has prevailed in that city the past two or three years under the name of "mind cure," "faith cure," "Christian science," "metaphysical healing," etc., has run its course there. It seems to have reached Chicago later, and judging from what we have seen and heard, the craze is about at its height in this city.

The fact of the influence of the mind over bodily conditions is unquestionable, and the adherents of these new (or old) methods of treating disease have considerable latitude in which to indulge in general statements on this subject. Every intelligent person knows that there is an intimate relationship between mental and physical conditions, that a mental shock may produce physical paralysis and that contusion of the brain may cause unconsciousness or insanity.

This undeniable fact of the influence of mental conditions of the organism over those conditions distinguished as physical, serves as the basis of the dozen or

more metaphysical and theological theories of the mental healers, some of which are wild and crude and belong to primitive rather than to modern thought, and none of which admit of scientific verification. In connection with each of them, are put forth claims as to extraordinary cures which have been or may be affected by the method of that particular "school" or system. So contradictory, and so superficial and undigested are the speculations advanced by the teachers of mental healing, that they at once give rise to the presumption that between them and the essential principle observed in producing the practical results, there is only an assumed and imaginary connection.

But what are the results. If the practitioners of these different schools of mental healing are to be believed, there are few if any diseases which they are not by their methods able to overcome; and they can all cite the testimony of persons who have been treated by them in support of all the claims they make. But anybody who has ever taken the pains to investigate these claims as the writer has, knows that when the exact truth is learned, the wonderful cures are at once divested of all that made them appear miraculous.

One of these practitioners in Boston, one whose rooms were thronged with patients, represented that he had by his method been able to effect cures in several cases of cancer, cataract, etc. A committee was appointed by the society before which his statements were made, to investigate a few of his cases. The committee took from this "healer" the names and addresses of half a dozen persons whom he claimed to have treated successfully for these diseases, and by careful examination of the facts, found that among them all there was not one case of cancer, and that his representations generally were false. Some women and even men had been wholly or partly relieved of nervous affections; and this fact, in no way remarkable, was sufficient to satisfy hundreds of people of the truth of his pretensions and of the truth, too, of the ridiculous notions which he presented as science, in explanation of his method of practice, and in all seriousness, as a final solution of those problems with which other thinkers, because lacking "the understanding of God," had grappled in vain.

Yet after making allowance for exaggeration and misrepresentation, willful or unintentional, there remains a residuum of truth sufficient to indicate that, underlying all the methods which give prominence to the power of the mind in the alleviation and cure of disease, is an important principle, a better understanding of which may yet lead to most beneficent results.

The various systems of mental healing have a modicum of truth for a basis, and in spite of the credulity, superstition and charlatany which have marked the craze, it may do something to make the people see what

"Hail to thy face and odors glorious sea!
 'Twere thanklessness in me to bless thee not
 Great beauteous Being! in whose breath and smile
 My heart beats calmer and my very mind
 Inhales salubrious thoughts."

Sidney Lanier in his *Hymns of the Marshes* pays sweet tribute to the "green colonnades, of the dim sweet woods, of the dear dark woods," which he calls

"Beautiful glooms, soft dusk in the noonday fire—
 Wildwood privacies, closets of lone desire,

Chamber from chamber parted with wavering arras of leaves,—
 Cells for the passionate pleasure of prayer to the soul that grieves."

In the hot summer days now upon us who does not with Alexander Smith, "pant for woodlands dim," and long

"To lose the sense of whirling streets 'mong breezy crests of hills,
 Skies of larks and hazy landscapes with fine threads of silver rills;"

or wish with Whittier,

"To feel, from burdening cares and ills
 The strong uplifting of the hills."

and at last decide with Bryant to

"Away! I will not be to-day,
 The only slave of toil and care.
 Away from desk and dust! Away!
 I'll be as idle as the air.

"Beneath the open sky abroad
 Among the plants and breathing things
 The sinless, peaceful works of God,
 I'll share the calm the season brings."

But there are toiling over-worked thousands yet to whom vacation time is only a meaningless phrase or exasperating suggestion, and others to whom it means only added labor. Every year thoughtful philanthropy is widening the area of its blessed privileges, and may not the release from their regular routine of thought which it brings to earnest men and women, give them the needed time in which to plan for others more needful even than themselves of rest—the poor, the sick and the miserable—some methods of securing it for such!

S. A. U.

COMPETITION A CONDITION OF PROGRESS.

With advancing civilization competition changes its forms, its methods, but never disappears. Reformers who would eliminate it from the active life of man, disregard the fact that under its influence man has always acted, and that it has been and is now as essential to progress as are association and co-operation. Competition between nations even now is, to a considerable extent, competition in military strength, in ability to arm and equip large armies for the destruction of life and property. As the sympathies of men broaden and the interests of nations become more inter-dependent, war must cease, when the vast energies which war now absorbs, will be given to the pursuits of peace. In all

the peaceable arts and industries, upon which a non-military community must depend for rank and influence, competition, under a different form of course, is just as necessary to success as it is in a community which relies upon its preparation and genius for war. And competition in the industrial world, as in the lower forms of the struggle of life means the success of some and the failure of others, prosperity here, hardship and suffering there, injury to one class or community by reason of circumstances which prove advantageous to others. Thus Mr. John Fretwell writes to *Unity*, "that since the heaviest blow inflicted upon Hungarian prosperity in the last few years has come from the competition of your western prairies with the plains of Hungary, formerly the granary of western Europe, I venture to ask you to draw the attention of American Unitarians also to this terrible misfortune that has befallen our poor brethren in Hungary."

The fertility of our western prairies, and the enterprise of our western farmers and of our grain merchants have contributed to the prosperity of this country; but it seems that they have brought "terrible misfortunes" upon Hungarians—a fact not pleasant to contemplate. Perhaps the Hungarian farmers who are suffering from inability to compete successfully with our western farmers, will be forced into raising other products or be compelled to turn their attention to other industries, in which they may in time become so prosperous as to be the cause of a misfortune elsewhere as great as that which has befallen them. It is this very necessity of putting forth new energies, of forming new plans, and trying new experiments that spurs men onward, forces them out of old ruts, and urges them to make the changes and the adjustments without which progress is impossible. The most that philanthropy can do is to secure as far as possible equality of opportunity for all, and to afford to the incapable and the weak such encouragement and direction and help as will make them fit to survive.

Professor Egbert C. Smyth, of the Andover Theological Seminary, charged with denial of the plenary inspiration of the Bible and with teaching the doctrine of "probation after death," contrary to the creed and purpose of the institution, has been pronounced guilty by the Board of Visitors. But the Board of Trustees are in sympathy with Prof. Smyth, and he cannot be deposed except by a decision of the Supreme Court of the State, to which appeal will probably be, if it has not already been made.

* * *

In an article entitled "the American State and the American Man" in the current issue of the *Contemporary Review*, Dr. Albert Shaw dwells upon State interference in personal affairs which he declares prevails to a far greater extent than the majority of intelligent Americans imagine. He admits that *laissez-faire*

doctrines are taught in the schools and colleges, but places over against that the statement that the American does not act in accordance with them, that in fact he keeps "his economics and his practical politics as separate as some men do their religion and their business, and he is just as naively unconscious of it." He offers the legislation of the Minnesota legislature during the sixty-day session of 1885 as evidence in support of his statement, and cites numerous laws that may be classed as instances of State interference. He emphasizes the fact that these laws were passed by men who profess *laissez-faire* principles, no connection existing between their political philosophy and their votes. He advocates unlimited State interference as a cure for this anomaly, and says: "Let it be understood that it is within the legitimate province of the State to do anything and everything," and he believes that the result would be scientific, and consequently better legislation.

* * *

In the lately published *Life of Longfellow*, by his brother Rev. Samuel Longfellow, extracts are given from his journal which afford the uninitiated an idea of some of the amusing as well as annoying penalties of fame, of which the following is cited as a sample:

Two women in black called to-day. One of them said she was a descendant of the English philosopher, John Locke, and that she was going to establish a society for the suppression of cruelty to letter-carriers. A lady in Ohio sends me one hundred blank cards, with the request that I will write my name on each, as she wishes to distribute them among her guests at a party she is to give on my birthday.

A gentleman writes me for "your autograph in your own handwriting."

Am receiving from ten to twenty letters daily, with all kinds of questions and requests.

Letters, letters, letters. Some I answer, but many and most I cannot.

Think of the sublime impertinence of requesting a busy man to write his signature one hundred times for a stranger's pleasure. One naturally wonders if she would not have charged to his account any that might be spoiled in writing!

* * *

The Seybert Spiritual Commission of Philadelphia, have in a volume of 150 pages, about to be issued by the Lippincott Company, made a report of their three years' investigation of mediumship. Slade, Mrs. Margaretta Fox Kane, Mrs. Best, Mrs. Maud Lord, Mansfield and several other mediums were tested, all of whom the report says used fraud, while none of them performed any extraordinary feats. The commission says that "without imputing untrustworthiness to the testimony of others, we can only vouch for facts we have ourselves observed."

* * *

Hon. Geo. S. Hale in a recent address to a Unitarian Association mentioned that when Victoria was born no person could hold any office of trust or honor in the

Kingdom of Great Britain without participating in the sacrament according to the usages of the English Church, and that when James Martineau was born it was a "crime to express the sentiments which we commemorate and proclaim." These facts suggested to Mr. Hale, "the space over which society has passed and how it pitches its moving tents each night, each day, each year, each century, nearer to the Mecca of a happy union of all religions."

* * *

The Transylvanian Saxons have many peculiar customs, some of which are revealed in an article reprinted from *Blackwoods Magazine* in the *Popular Science Monthly* for June. We note one of these customs in the following, of which the Saxon mother finds consolation for whatever natural deformity her children may be afflicted with: Whenever a child grows up clumsy, with a crooked nose, a large head, or with any disability of mind or body it is claimed that an evil spirit has stolen the original child from the cradle and substituted an elf; once satisfied of this, very cruel remedies are sometimes used in order to force the evil spirit to restore the child, for instance the unfortunate creature suspected of being an elf is placed astride of a hedge and beaten with a thorn branch until it is quite bloody, when it is supposed that the evil spirit has brought back the child again.

* * *

The Victorian era has been one of great progress in science, in the arts of industrialism and in political, social and religions reform. In these movements the queen has had but little active participation, but her character as a wife and a mother, her good influence on the side of marriage and home, and her pure tastes and sympathies which have raised her life far above the standard of her ancestors, have secured her the respect of millions who know that as a sovereign she is but little more than a political figure-head. The jubilee observances in England as well as in this and other countries, are in the nature of a personal tribute to a woman who is honored for her simple virtues, and for the good influence which she, in her high position, thereby exerts on all classes, rather than for any remarkable gifts she possesses, or great achievements on her part.

* * *

Says the Chicago *Times* in vein of irony:

There should be a specific tax on each and every minister imported from a foreign country, and another one on their appraised value. If the people living on Back Bay, Broadway, or Prairie avenue want to indulge in the luxury of an imported minister, they should be made to pay roundly for it. The money raised in this way could be used in helping to support poor churches in the country that are not above hearing the gospel preached by ministers produced on our soil. Of course we cannot compete in the production of ministers with a country possessing as many advantages as England has. Manufacturing ministers in this country is an infant industry that deserves to be protected and fostered by the general government.

We find the following in the Boston *Transcript*:

Two small children, one of them four and the other three years old, were taken to see the stuffed animals that Barnum has given to Tufts College—Stuffed College these children now call it, quite naturally—and saw the elephants and giraffes and other beautiful animals, and had an idea given them of the difference between these figures and the real creatures. On the Sunday after this visit the children were favored with a little lecture on the future life and the spiritual body, and a very intelligent attempt was made to convey to them an understanding of the idea.

"Yes, I know how it is," said the elder of the two, eagerly; "they just take us after we're dead, and take our skins off, and stuff'em with sawdust 'n' things, 'n' then we're spirits!"

This is a conception of the future existence which is recommended to the Psychological Society as possibly containing the germ of a great discovery.

* * *

Rukmabia, the Hindu lady from whose pen there have proceeded a series of striking letters signed "By a Hindu Lady," in which the evils of the Hindu marriage system have been most clearly shown, has recently been condemned by the Bombay High Court to take up her residence with a husband to whom she was betrothed at the age of eleven. Her long continued resistance has raised the question whether British law shall not be brought to bear upon the Hindu marriage custom with the purpose of reforming it.

* * *

The length of Dr. Montgomery's essay, Part III, compels us to divide it; but there will be no delay in publishing Professor Cope's reply, which is to begin in the next issue of THE OPEN COURT, in which Dr. Montgomery's paper will be concluded.

* * *

In the death of Mark Hopkins the country has lost one of its most eminent educators and one of its most useful and honored men. He was for nearly half a century president of William's College.

SOCRATES.

BY W. F. BARNARD.

Great sage, philosopher, high-minded man,
Lover of truth, scorning to lie and live;
No praise too great for thee can man ere give,
No nobler life hath been since life began.

We yield the highest honor to thy name
For thy great duty done. What glory now
Is 'round about thee. Ne'er upon thy brow
There lay a laurel wreath to crown thy fame.

Nay, thou had'st never need of this, there pleads
Thy high unselfishness, thy hate of fears,
Thy teaching of the higher human needs,

Thy faithfulness through all thy stormy years,
And thy triumphant death; these noblest deeds
Are everlasting voices in our ears.

"I DO NOT KNOW."

BY SARA A. UNDERWOOD.

You sorrow, friend, that your faith is not mine;
You vainly grieve because when Death shall call
I own I know not where I go, or if at all
I go, or stay, cease being, or enter some new life divine.

I grieve but for your grieving! Once in youth
Your faith *was* mine; and when Death came too near
I faced him terror-stricken: believing fear,
Possessed my soul when I thought creed was truth.

Some truth since then I've learned, and by its test
Have found the creeds to totter, crumble, fail,
Their seeming strength built on foundations frail,
On crude imaginings, man's hope and fear at best.

Once, in my ignorance, I glibly prated
Of devils, pains, and penalties; of God and bliss,
Reward and punishment. But now I know but this:—
I do not know to what humanity is fated

Save that which men name *death*—the sure estate
Which comes to all alike—the sphinx-like unrevealer
Of Life's enigma,—the dumb tantalizing sealer
Of the unanswered questions put by man to Fate.

But we know not—though much we long to know—
What Death may be: beginning, mean, or end,
Or whether it comes as teacher, foe, or friend—
Our eager questioning wins not "Aye" or "No."

To all alike it comes; the great, the wise, the good,
The sinful, sad, the strong, the weak, the gay,
The saint, the hypocrite, the prophet, each one day
Receives the summons—no matter in what mood.

Yet death I fear not—souls as weak and blind
As mine its dark ordeal have passed serene,—
Why should I falter at some change of scene,
Which I but share with all my human kind?

But should immortal life, my friend, be ours,
I shall be glad as you—and try to scale
With you its further heights, if strivings then avail—
With joy accepting all my new-born powers.

Mayhap then, by some alchemy here unknown,
Our baser natures may toward their likings stray
And hateful qualities drop from us quite away,
While what is best within us seeks its own.

And if—as may be—for I do not, cannot, know,
To unsufficing life, death brings sure end
I need not murmur—nor need you, my friend,
Whose creed, *believed*, means far less joy than woe.

I say "I do not know"—most surely do not,
Yet have I caught faint gleams of what seemed light—
In hours, in ways, too sacred here to cite,
Like gleaming from a distant star we view not.

COPE'S THEOLOGY OF EVOLUTION.

BY DR. EDMUND MONTGOMERY.

Part III.

Our understanding revolts against the supposition that organization with all its marvellous adaptations can be due to a mere fortunate confluence of chance occurrences. It is, indeed, quite inconceivable that the fortuitous arising of variations wholly unrelated to the propensities and needs of life, should by the negative process of successive weeding, ever be competent to construct out of shapeless material those most specific organs with which we find ourselves endowed; and still more inconceivable that organs thus formed should display those wondrously purposive activities which we call their functions. Surely, we are not shaped from without merely to fit conditions of the medium. It seems far more credible that we are shaped from within that conditions of the medium may fit us. Evidently there is here some definitely formative, nay, some positively creative power at work in the living substance. Where can it come from? Of what nature can it be? These are the decisive questions.

Now, if you are a mechanical biologist, believing fully with Professor DuBois-Reymond and our present physical science in the doctrine of the Conservation of Energy, you have here no particular problem at all before you. For, from this point of view, the first cast of the dice, the first launching of the world-forming atoms, had already decided, unchangeably—with absolute fatality—all that has followed since, or will ever follow hereafter. The arising and preserving of such and such variations is, then, an occurrence as rigorously predetermined as anything else in nature—everything that ever happens happening of necessity, through undeviating predisposition, exactly as it does. There is, indeed, no escape whatever from this conclusion, *unless the mechanical conception itself is fallacious*. Every biologist who introduces into this unbending mechanical nexus any kind of deviating or directing influence ought clearly to know that he is opposing the doctrine of the Conservation of Energy; wittingly or unwittingly he is professing himself an unbeliever in this supreme generalization of modern science. To consistent physicists as to consistent theists, the first kinetic cast of the world-material must be the all-important, all-involving event in creation. It is strange that theistic predestinarians have not seized more eagerly upon this argument. They should welcome the mechanical materialists as their most potent auxiliaries. There is, in truth, no better theistic stronghold of the natural sort anywhere to be found. Only, then, we mechanically constructed puppets would be automata sure enough; and in spite of theology and logic, human self-humiliation—so ready to indulge its mood up to a certain point—refuses to degrade itself that far.

The perplexity regarding the evolutionary drift of the physical nexus is nothing new. Since Democritus it has been the standing difficulty of the mechanical conception to derive complexity of form and aimed activity from material particles and their motion. Democritus, in order to account for the deviation of atoms from the straight path during their primordial fall through space, fancied that larger atoms had overtaken smaller ones, which—thereby diverted from their course—came to form more and more intricately entangled arrangements. Epicurus, however, was aware that in empty space material particles, whether large or small, must fall with equal velocity. He assumed without explanation, that a spontaneous deviation from the straight path had gradually given rise to complexity of form and motion. His disciple Lucretius, very much in the manner of Professor Cope, sought to furnish an explanation for this deviation by violently breaking through the physical order on the strength of our experience of voluntary movements. Modern cosmogony with the aid of the law of gravitation—a law itself mechanically unexplained—got over one great difficulty involved in the ancient view, namely the inevitable falling of all atoms to the bottom of the world. And it acquired, moreover, a principle by which material particles are made to form aggregates on their way to common centers, deviating at the same time from the straight path through collisions.

To account for the second great fact, that of teleological disposition in nature, the mechanical views of antiquity took their cue from Empedocles; conceiving that in endless time all possible material configurations must necessarily occur, and that those most advantageously constituted would naturally tend to maintain themselves. This may be called the Darwinism of the ancient philosophy.

Historical connection with these ancient views has been made here because our mechanical world-conception was formed in direct continuity with them. Soon after Gassendi had revived the Atomism of Epicurus, it was adopted in its main features by Descartes, Boyle and Newton, and has been used ever since with signal success—leaving unsolved, however, the problems of material integration and teleological direction.

It is the scientific installation of matter and motion, not only as the building material, but also as the building efficiency of our world, that has thrown into prominence the psycho-physical dilemma, which we have called the central problem of modern philosophy, or "the puzzle of puzzles." Now, if we ever desire to extricate our understanding from the philosophical and scientific deadlock, produced by the artificial opposition of a material substance to a mental substance, each of which has to follow its own course without possible interaction; if we desire to attain a unitary view of

nature we have, first of all, to be strictly consistent, not allowing any makeshift compromise to establish spurious openings for an apparent blending of the two postulated spheres of reality.

The principle of the Conservation of Energy—as already stated—presupposes, without escape, that from the very beginning the original material particles were started with definite velocities in definite directions. And this primordial disposition involved, then and there, with absolute necessity the entire ensuing world-evolution in all its minutest details. No philosophical scientist who uses this leading principle of modern physics, not merely as a working hypothesis in the investigation of special problems, but as a torch to illuminate our world-conception, can deny the validity of this its final implication. And who can fail to see that this view is really the special creation-hypothesis brought to a focus, concentrating into one sole omnipotent act of premeditated design the rigorously fore-ordained production of all that was ever to take place in the physical universe?

In a mechanical scheme of this kind mental states can come in only as passive accompaniments, and conscious realization can only witness as an unrelated outsider the physical spectacle, being utterly impotent to affect its course in the least degree. We are forced by such a doctrine to conceive our mental nature as having an origin, a history and a destiny totally independent of the physical world. This, however, is altogether contrary to experience; and it is, moreover, an evident fact that we actually realize whatever is perceptible of the physical world in our own individual consciousness. Our perception of it is undeniably a mental occurrence within our own being. Now, the impossibility of conceiving mind as consciously reproducing, indeed as identically duplicating—within its own sphere of existence by means of its own affections—the physical universe, to which, according to the mechanical view, it is wholly unrelated and incommensurable;—this impossibility of imagining the universe realized in consciousness as in any way connected with the universe assumed in physical science, has led many philosophers to trust exclusively their immediate consciousness and deny altogether the existence of the physical universe. The untenability of this very prevalent idealistic escape from the psycho-physical dilemma the present writer has endeavored to expose on various occasions, and has pointed out what seemed to him the only possible solution of the puzzle.

But the principle of the Conservation of Energy is still governing physical science, and biologists are as perplexed as ever how to derive organic teleology in accordance with it.

The ways and means by which organic forms are naturally built up have remained all the more obscure on account of our being able to study exhaustively by

direct observation only *re*-productive organization, while productive organization, which has taken ages to get accomplished, is left a matter of inference chiefly. Ontogenetic or individual evolution may rapidly epitomize phylogenetic or race evolution; yet, most assuredly the reproductive germ, which contains potentially in its own intrinsic constitution, all phylogenetic results, cannot possibly undergo a process of development which can be at all causatively compared with that of a primitive protoplasmic form, competent at first to reproduce merely its own duplicate, and which only increment upon increment, through ceaseless interaction with the medium, during countless generations, has at last come to be the complex being we now find. Productive evolution, differing thus radically from re-productive evolution, demands a radically different explanation. This is not sufficiently born in mind. Evolutional science has to put two totally distinct questions: How are developmental traits individually acquired? And how are they then generically transmitted?

Since the discovery of reproductive germs in all organic propagation, it has become plain to everybody that through these minute material vehicles, organization, with all its peculiarities, is somehow transmitted from parents to their offspring. A reproductive germ is a very tiny and inconspicuous sort of a thing, but the downright fact is, that without it, we and the rest of the organic world would be non-existent; with it we become everything we are. Metaphysically unbiased scientists could not fail to perceive that mental endowments form likewise part of this organic heritage. Now, if it is difficult to make out exactly how parental organization can be reproduced in all its complexity from a uniform and microscopic germ, it is still more difficult to understand how specific mental faculties are reproduced along with the specific material structures.

In this connection the phenomena of instinct, which constitute a kind of link between reproduction of mental and reproduction of purely organic traits, became a subject of particular interest. Instincts, at all events, appear to be closely connected with organization. Indeed, Lamarck already regarded them as acquired mental habitudes, which had become organically fixed. He says: "This inclination on the part of animals to persist in their habits, and to renew the actions subservient thereto when once acquired, is propagated thenceforth in all individuals through reproduction or generation, by which the organization and disposition of the parts are conserved in the acquired state, so that the same inclination exists already in the new individuals, even before they have exercised it." (*Phil. Zoologique*, 1809, p. 325.) Blainville (1832) calls instincts "fixed reason," and reason "mobile instinct." Comte (1838) makes use of the same considerations as Lamarck to account for the transmission of any kind of acquired aptitude ("*une*

pratique quelconque”) in man or beast. (*Cours de Phil. Pos.*, Vol. III, p. 787.) And seventeen years later we find Mr. Herbert Spencer, in his *Principles of Psychology*, expressing the same opinion: “Instinct may be regarded as a kind of organized memory.” (p. 555.) “Conscious memory passes into unconscious or organic memory.” (p. 563.)

The materialistic philosophy of the eighteenth century had made this kind of interpretation current among physiologists. Vital activities of every description, mental or non-mental, were held to be functions of the organism. Acquired habits were said to have become organized by means of definite modifications in the structure of the functioning organ, conscious memory being no less regarded as the outcome of such organic modification. It was to the persistence of the *molecular* modification evinced in the revivability of the experimentally modified function, that the term “unconscious memory” was applied, and not to any latent efficiency possessing the nature of mind. Professor Hering’s very lucid rendering of the genuine doctrine, the doctrine that memory is a “function of *organized matter*,” has, strange to say, become the nucleus of various fantastic speculations even among biologists. The equivocal term “unconscious memory” was seized upon and pressed into service as a *mental* agency that coerces the material of which the organism consists.

The essential and revolutionary import of the eighteenth century interpretation lies in the implied assertion that there exist in the living individual mental acquirements which are functions of his organic structure. And it is evident that, if some mental states are allowed to be thus functions of organic structure, then all mental states must be allowed to be functions of organic structure; for consciousness, meaning the manifestation of mental states of every kind, is a unitary phenomenon, all constituents of which are essentially of one and the same nature. Our mental presence, or moment of actual conscious realization, contains all sorts of mental states inextricably blended, pointing to one common source of emanation.

It is of the utmost importance to be perfectly straightforward, discarding every kind of vagueness and ambiguity, in declaring organization to be the veritable matrix of mind. For the proof of this assertion, if it can be given, decides for good, among the sundry claims for philosophical insight, in favor of objective or realistic monism. It would follow therefrom, inevitably, that—consciousness being a function of organic structure—organic structure cannot possibly be in its turn a product of any kind of mental operation. Nor could consciousness be anything in itself independent of organic structure; no affection of a mental substance; no efflux from a universal consciousness; no mode of an unknowable first cause. The essential, all-important question, then, is: Does

organic structure determine mind, or does mind determine organic structure?

Many reasoners and investigators, before our present animists, such as Haeckel, Murphy, Butler, etc., have maintained that a mental activity of an unconscious kind is shaping the organism. And if we ask why they have come to evoke mental aid to effect this peculiar kind of material grouping, we find that it is simply because they were aware that our conception of physical efficiency is incompetent to account for the reproduction of the complex organism from a uniform germ. Thoughtful biologists—however mechanically inclined otherwise—have very generally felt obliged, no less than Plato and Aristotle, to assume some hyper-physical principle coercing vital building-material into organic shape. Claude Bernard believed that “in all living germs there resides a creative idea,” and Professor Virchow admits that the unity of the future organism must be somehow potentially contained in the germ-cell. Considering only morphological results, regardless of vital activities, it remains, indeed, even then, utterly unintelligible on mechanical principles how, through agitation by heat-vibrations, the germ-molecules should be rendered competent to transform adjacent pabulum into vital building-material, causing it to aggregate in the minutely predetermined and wondrously intricate form of a living chick or other complex organism. What, in all reality, can it be that induces the material of the germ-cell to accomplish such marvelous reproductive evolution? It is this crux of biological science that has proved sufficiently distracting to drive even cool investigators to desperate means of explanation. Our so-called memory being a faculty of *mental reproduction*, it has seemed plausible to some perplexed mechanical biologists that something of the same nature as this ideal remembrance of former existence must be likewise at the bottom of *organic reproduction*.

Now, as hinted before, it is quite obvious that, if memory or mental reproduction depends on specifically organized structure—a state of things generally accepted as a fact by evolutionists,—then specifically organized structure cannot reciprocally depend on memory or mental reproduction. This would be out of the question even if mental states were capable of influencing the physical nexus. A certain something cannot possibly be at one time the produced effect of something else and at another time its producing cause. The relation cannot be reversed. If B is an outcome of A, then A can by no manner of means become an outcome of B, for B merges into existence only through A. But waiving these impossibilities, and allowing, beside, that mental reproduction may be itself a formative or organizing power; admitting, furthermore, that no contradiction is involved in assuming that something mental can exist in an unconscious state; granting all these

absurdities, it remains still wholly incomprehensible how the unconscious memory of a number of germ-molecules can transform an immensely larger mass of pabulum into living substance, and finally succeed in constructing the complex organism,—an achievement which from the beginning must have been the aim of the unconscious memory residing in the germ-molecules.*

Professor Cope, who also believes in the organizing power of mentality, is at least aware of the fraudulent pretensions of so self-contradictory a thing as "unconscious memory." He does not operate with this self-stultifying and nullifying agent. He says: "No sensibility" (or other mental condition) "is meant, which implies that the person who is supposed to be sensible is unconscious,—this is a contradiction in terms, or self-contradictory language." (*T. of E.*, pp. 9-10.) We entirely agree. Let us not delude ourselves with words. It is quite certain that memory as a mental fact is conscious, and that organic predisposition to action or function is not a mental fact.

How does Professor Cope then account for the organic predisposition inherent in the germ-cell, which causes it to construct the complex organism? He assumes, to begin with, a peculiar force, to which he gives the name of "bathmism" or "growth-force." This force, he maintains, increases organic bulk by "repetitive additions," *i. e.* cell-division. It "simply adds tissue either in enlarging size or in repairing waste." (*O. of F.*, p. 203.) This explanatory assumption amounts, evidently, to no more than giving a new name to the biologically unexplained fact of cell-division and consequent increase of bulk. Let us see whether we become in any way enlightened by its application to the old fact. He says: "The spermatozoid is highly endowed with static bathmism, and communicates it to the female ovum. The mingling of the two elements in the presence of nutritious material presents an excess, and form-building results. Its activity will regulate subsequent new growth by giving the motion of nutritive material its proper direction." (*O. of F.*, p. 191, note, 1886.) Here growth-force accomplishes really vastly more than "simply adding tissue in enlarging size." It uses the added tissue as "form-building" material; this being, indeed, the most enigmatical part of the whole performance. But let that pass for the present. The plain and observable fact here is, and has long been, that "form-building results" from "the mingling of the two elements," and that "the motion of nutritive material" receives "its proper direction." The great puzzle is to find a scientific explanation for this marvelous occurrence. Has Professor Cope made any advance in this direction by

calling in an entirely unknown and unverifiable agent, and assuring us, that it is this most efficient *fac totum*, named bathmism, who is the veritable performer of the stupendous organizing task in question? We all know well enough that organisms grow; but are we any the wiser for being told that they grow by means of growth-force?

But, even thus largely endowed, the constructive ability of the new *fac totum* fails, when called upon to build up heterogencous textures; for instance, to build up, not merely a mass of epithelial tissue, but also muscular and nerve-tissue. Here new help has to be evoked. The task is to evolve a succession of graded tissues. To accomplish this, Professor Cope infuses a "grade-influence" into the growth-force, and is then in a position to operate with "grade growth-force," simply by assuming that "grade-influence directs growth-force." (*O. of F.*, p. 203.) But whence does "grade-influence" derive its directing power? Professor Cope tells us: "grade-force is not regarded here or elsewhere as a simple form of energy, but as a class of energies, which are the resultants of the interference of mind (*i. e.* consciousness) with simple growth-force." (*O. of F.*, p. 208, note, 1886.) So we have come round again to the Anaxagorean device of shifting on the *nous* the hyper-mechanical work manifest in the material process, trusting that this *deus ex machina* may somehow acquit himself of the imposed duty.

(TO BE CONCLUDED IN THE NEXT ISSUE.)

CORRESPONDENCE.

A LETTER FROM PHILADELPHIA.

To the Editors:

PHILADELPHIA, June 6, 1887.

It is an old story, but a good one, that of Emerson in Egypt. It is a kind of intellectual tickle, touching humorously on the great characteristics of the Concord seer, and a spontaneous ripple of amusement broke over his audience, yesterday, as Mr. Sidney H. Morse, after reading with enthusiasm that noble poem, *The Sphinx*, continued: "You know the story is told, that when Emerson went to Egypt and stood there in the desert by the old Sphinx, she opened her lips and said to him, 'You're another!'"

This was at a meeting of the Sections of the Philadelphia Society for Ethical Culture, held at the school building. The regular course of lectures of the society, in the regular place of meeting, has closed for the summer; but it has been thought advisable to keep up some continuity of the corporate life of the society in spite of the torrid season, and so it has been determined to hold meetings of the sections on the first Sunday of each month until the regular lectures begin again. Mr. Morse, of Boston, the sculptor, and former editor of *The Radical*, well-known to the Liberals of New England, being in town at work on a bust of our Camden poet, Walt Whitman, was persuaded to talk to the sections on "Emerson." Mr. Morse said, aptly enough, that the ethical movement seemed to be the heir of Emerson's teachings.

The leader of the Philadelphia society, Mr. Weston, at the end of Mr. Morse's talk, took occasion to acknowledge that no other writer had been to him so helpful and suggestive as Emerson. Other members of the society must have felt a like due

*The fallacy of Professor Haeckel's special view of this kind of mentally originated organization, called by him the "Perigenesis der Plastidule," the present writer has exposed in *Mind*, No. XIX, 1880.

impulse of spiritual gratitude as they sat there hearing one who had known the man read and speak of his great message, while from the chimney-piece shone down upon them the white light of the benign wise face of the Emerson bust, delicately modeled in the clay by Mr. Morse, and full of the gracious characteristics of a loving likeness.

At the next meeting of the sections, on July 3, an unpublished lecture of Professor Adler's on "The Influence of Mind on Morality" will be read.

Walt Whitman lives, as is well known, in great seclusion. He is visited, but rarely visits, and his early hours and simple habits keep him as aloof from the world as his heart will let him. The lecture in New York this spring, which everyone has heard about lately, on the anniversary of the Lincoln Assassination, was a repetition of a similar friendly ovation in Whitman's honor a year ago, in the Chestnut Street Opera House here. From then until last winter, the 22d of February, when he consented to meet with his fellow-members of a new club recently organized in Philadelphia, and read them some of his poems, I suppose he has not once met, in town, with anything like so large a social assemblage. The rooms were crowded, the low platform was invaded; faces and figures, brighter and more conventional, were close on every side, but none were so marked as his. In the midst of the group about and on the platform he was still aloof. He sat there in loose gray clothes, in a big rocking-chair, his neck free in a wide, white turned-over collar, the long gray hair and beard falling full upon it, his blue eyes looking a little dazed, though masterly and unabashed, when he lifted them from his glasses and his book or MS. to gaze out over the listening faces in front of him. Poor poet! he looked more perplexed and troubled afterward, when he had done reading and two or three people undertook to talk over theories of poetic art in general, and his own peculiar methods in particular. He had invited and allowed it, of course, and, of course, it was not the personal element in it that bothered him. Perhaps it was a natural perplexity (I will hazard the guess) in seeing that these men evidently had some established code of poetic methods in mind which they called "art," of which he, a poet, never thought of as a settled thing cut out in a finished block with rigid edges and angles square, but rather as something everlastingly mouldable, as his baggy clothes were by the more important body that wore them, and asserted "*Le style c'est l'homme!*"

The formation of this club, of which he is a member, was quite an event in Philadelphia life last winter, and it promises to be of progressive interest for many seasons to come. It was formed upon the model of the Nineteenth Century Club, of New York, and with much the same liberal aim in view; that is, to gather together from the various prominent elements of literary, artistic, scientific, journalistic, political and social life of the city, a representative association which would be interested in the discussion and consideration of all manner of current subjects, competent to follow and further the latest development of thought or experiment and to debate thereupon, yet under such pleasant social conditions as would not only enlarge thought but stimulate its best social influences. The first general meeting was called early in January, and regulations and a name were then discussed, but not until a later meeting, on the 31st of January, was the Contemporary Club duly christened and fully launched. But at the first earlier meeting, one of its members, who has since removed to New York, and whose hand and mind may now be perceived in the editorial management of that capable new paper, *The Epoch*, Mr. Nathan Haskell Dole, the translator of *Anna Karenina* and other Russian novels, addressed the club on "The Russian Language and Literature," and some discussion then followed upon Realism in Fiction. It was at the second

regular meeting of this new club that Walt Whitman appeared. Since then, "Vagabond Life in Eastern Europe" has been described by Mr. George F. Kennan; "Some Recent Phases of Psycho-Physics" have been reviewed by Professor Stanley Hall, and the question, "Who Pays Wages; Capital or Labor?" has been considered by Mr. Joseph D. Weeks.

Mr. Kennan's current magazine articles on Russian matters, and his recent papers on Tolstoi, in *The Century*, are familiar. And his vivid narrative of travel and personal adventure was the main feature of the evening when he spoke before the club, it may be understood; but not the least interesting were the details concerning the political and intellectual slavery of the Russians, and the family, property, and theories of Count Tolstoi, details which were elicited from Mr. Kennan's special experience by questions put by Mr. Talcott Williams, of *The Press*; Mr. Tatui Baba, the distinguished Japanese Radical, and by others. In fact, the interchange of question and answer, and the action and reaction of different views and opinions, which is arranged to take place upon the given subject of the evening after the stated address is finished, is a most valuable feature of the plan of the Contemporary Club. The fact that these after-clap discussions—to say nothing of the smaller discussions thereupon agitated in social groups—seemed to increase in interest at each successive meeting, points encouragingly to the future success and influence of the Philadelphia Club. Other signs of its success are not wanting, for its membership is limited to a hundred, and its limits are virtually full, while the list of applicants for admission is patiently lengthening and awaiting possible vacancies. Why should not such liberal clubs be organized from the representative elements of every large city? And why would it not be desirable for such clubs to form with each other some social affiliation?

Mr. Weeks, the Pittsburgh iron-king, who addressed the club at its final meeting for the season, seems to have that union of practical and speculative ability peculiar, I often think, to the New Englander. I was not surprised, on asking him, to find that he hailed from Connecticut. It is the Emersonian temper to hitch your wagon to a star; and to make reforms practicable in the business world there is needed all the shrewd energy of the Yankee-ized American, for there are difficulties enough in the way of the co-operation of capital and labor, and these were brought out obstinately enough in the discussion that followed Mr. Weeks' statement of the theory that the capitalist advances the money which pays the wages labor earns, in the expectation that the business undertaken will pay.

Professor Hall's review of "Recent Phases of Psycho-Physics" was cautious, but earnest and far-seeing, as becomes a Professor of Psychology in the Johns Hopkins University. The speakers afterward—Mr. Hodgson, a member of the English Society for Psychical Research, and Professors Fullerton and Jastrow, of the University of Pennsylvania—were evidently, on various grounds, not fully in accord with his temper of approach. Mr. Hodgson, of course, considered that Professor Hall did not allow due weight to the evidence of the English society's experiments. And some of this evidence is curious enough, no doubt, as set forth in the society's reports; but after all, it can not be a mistake, on the other hand, to allow amply for the subtle, unconscious love of deception and deceiving which must at present underlie such recondite research; and the most thoughtful persons present that night must have felt that Professor Hall said much when he said, according to my understanding of his words, that, making all allowance for misconception and deception, there was still evidence remaining of a trend of things which might lead us to perceive that we were on the eve of the discovery of some law in psychology as powerful to alter our knowledge and progress in its domain, as the discovery of the law of evolution was powerful in biology; that the conditions were similar in

psychology now, as in biology then, just before that universal principle was apprehended.

The readers of THE OPEN COURT will be interested to hear of the earnest, almost spiritually scientific, work that Professor Hall's psychology class is now doing in Baltimore. They are visiting hospitals and asylums for the insane, collecting evidence from close experience of all sorts and conditions of men, and gathering knowledge of their brothers, which, subjected to scientific scrutiny, sifting and arrangement, may do much to prepare a wider moral knowledge. If they were to do nothing directly available to knowledge, yet, to put us on the way to find methods of approach in this great field of apprehension, would be to give progress a leading question. We may take the hint that the moral outlook at the Johns Hopkins is deep, earnest and stirring.

C. P.

LETTER FROM NEW YORK.

To the Editors:

JUNE, 1887.

Summer is upon us, full-fledged, and those who can do so are leaving the city. Fashionable churches will soon be closed, and they who most need access to these cool and beautifully sequestered places which are open only three or four hours in the week, at most, are deprived of shade and comfort during the heat of summer. I say nothing of spiritual refreshment, which is supposed to be their *raison d'être*, though that ought to be a higher motive than the other for keeping them open. How many millions of dollars are thus locked up in the heart of this city at a period when every nerve of the worker cries out for space and shade, only the expert statistician can approximate.

Bishop Potter has set on foot a scheme to build a grand cathedral, to cost, with the land upon which it is to be built, not less than \$6,000,000. Miss Wolfe's bequest to the Bishop affords a nucleus, and subscriptions are rapidly coming in. The Episcopal church in New York is very rich and generous—as far, at least, as the good of the church is concerned.

One of the ostensible objects in building the cathedral is to impress the public with the grandeur and dignity of the Episcopal form of worship; another and better is to furnish to that public a place of rest which shall always be open to the weary and heavy-laden. Daily service will afford a sinecure to a large number of resident priests. With so many churches already closed thirty-nine fortieths of the time, it seems pitiful that these should not be made oases along our hot thoroughfares, and the six millions be saved for industrial schools or other practical enterprises. If is probably too much to expect that, however.

Meantime, the crusade against land monopoly and priestly oppression, headed by Father McGlynn, assumes gigantic proportions. No one who has not carefully followed its course can rightfully conceive what may be its scope and extent. The daily papers report Father McGlynn's meetings as they would report Barnum's circus; to them they afford sensational news of the day. In reality, there is a widespread and spontaneous movement for which society has long been in process of evolution, which has its center in this city. The scouts upon its flank, composed of foreign emissaries, may be anarchists; but there is nothing more grand and pathetic than the patient self-possession and repression of those who compose the rank and file of the main body of agitators.

Of this semi-religious movement, undertaken in a great measure by Catholics, Father McGlynn is the real exponent and leader. Forced into the van by temperament and religious conviction, he is not the man to yield craven submission to the Pope or to take any retrograde step.

When he is about to speak four or five thousands vainly seek admission after the largest hall in the city is filled. The audience is made up of workingmen with their wives and daughters, at the

weekly meetings of the Anti-Poverty Society, and not a policeman is to be seen.

When Father McGlynn comes to the front he is greeted with an enthusiasm that finds vent alike in cheers and tears, and it is long before the tumult ceases. Those who give this ovation are mostly Catholics who have been helplessly bound to the Juggernaut of a foreign Pope, and here is one of themselves who is gradually loosening their chains while breaking his own thrall-dom. As he stands before them, big-bodied, big-brained and big-souled, with a noble, overhanging brow, massive chin and determined mouth, one moment stern as fate, again quivering with Irish wit or drooping with sympathy, meanwhile pouring out his fervid soul in natural oratory, the spectator realizes something of his peculiar influence.

The workingman to whom he speaks is fairly intelligent and altogether self-respecting; he is in earnest, and he is multiplying in power and numbers. And Father McGlynn is his prophet. No man was ever more loved than he, and no man, since Luther, has had the opportunity and provocation to become the leader in a church reform which, very likely, may yet be felt from Rome to its farthest circumference.

Concerning the peculiar land theories held by Father McGlynn and his friend Henry George, it is not necessary to speak. We are only considering his influence upon religious thought.

The Protestant clergy, as a whole, are afraid of Father McGlynn, yet there is a distinct growth in liberal thought among them from year to year. From Beecher's popularity and power they have learned to let creeds alone or handle them with gloved fingers. They choose more practical topics and give illustrations from real life more freely than they did five years ago, and they are eager for accessions to their ranks. For instance, a lady belonging to the liberal school of thought, living in a small suburb of New York, lately joined the Dutch Reformed church in order to secure social advantages otherwise wanting. "Do you love Christ?" was the only question asked by the pastor and brethren in examining the candidate. "What do you mean by that phrase?" she returned. "Well, do you love the principles of fraternal love and righteousness which he taught?" "Most certainly I do," she replied, and that was all they required. There was no suggestion of the atonement or other mysterious articles of orthodox faith to which she could not have subscribed. And this case is a type of many more. Comment upon the honesty of all concerned is unnecessary.

Is it not a part of the great liberal religious movement that the degree of Bachelor of Letters has just been conferred on Columbia College's first woman graduate? Miss Hankey, of Staten Island, passed the Harvard examination, four years ago, on twenty branches of study. She has taken the full course at Columbia and passed all its examinations with a remarkably high standing. Four prizes were awarded her for excellence in chemistry. Miss Hankey was not permitted to attend lectures or recite, and all her study was done without the stimulus of teachers or fellow-students. Her graduating thesis on "The Literature of Greece" won high encomiums, and President Barnard has watched her course with surprise and delight.

HESTER M. POOLE.

D. A. WASSON'S POEMS.

To the Editors:

JAMAICA PLAINS, MASS.

According to the wish of the late Mr. D. A. Wasson, I propose to arrange and publish a collection of his poems. Many of these have become very dear and precious to those who have known them in MSS., or in various collections, or in magazines. It is desirable to make the collection of his best productions as complete as possible, and I have already received copies of poems

from private sources, which were unpublished and unknown to me. I shall be very grateful to any one possessing such poems who will send them to me or give me information in regard to them.

EDNAH D. CHENEY.

BOOK REVIEWS.

GEDENKRUCH. Erinnerung an *Karl Heinzen*. Milwaukee: Freidenker Publishing Co., 1887.

This pamphlet of 107 pages shows how well Heinzen deserved the monument dedicated to him at Forest Hill, near Boston, a year ago, with the inscription "His life work the elevation of mankind." He was driven, on account of his share in the revolution of 1848, from Germany, and became in 1853 the editor of an anti-slavery journal at Louisville, Kentucky, where his press was destroyed by a mob. Among seventy-seven other publications are several in English, for instance, those entitled *Mankind the Criminal*, *Six Letters to a Pious Man*, *The True Character of Humboldt*, and *What is Humanity?* The last was published in 1877. The speeches at his funeral, in 1880, and at the dedication of the monument, by Messrs. S. R. Köhler, R. Lieber and C. H. Boppe, editor of the *Freidenker*, are in perfect harmony with the brief biographical sketches, and with the extracts from his writings. The spirit of these last may be judged from the words: "I could be perfectly contented at seeing the world go to ruin if a lie was needed to save it." "It is a law of history, as it is a law of botany, that no fruit can come forth and ripen unless the ideal blossoms first drop off and are forgotten." "Never have I covered up truth as contraband. I have always lighted the torch of thought completely, and announced my entire purpose."

F. M. H.

TRY-SQUARE, OR THE CHURCH OF PRACTICAL RELIGION. By *Reporter*. New York Truth Seeker Co.; pp. 312.

This purports to give the history of an independent society started by a plain, blunt, yet thoughtful and practical man named Job Sawyer, in a place called Pinville. The author professes only to give notes of the movement as a reporter. The organization was called "The Church of Practical Religion," and "Try-Square" was the rule by which the organizer tested his own and the society's work. This rule was "every act or word that will result in injury to anybody is wrong and is prohibited. No other act or word is prohibited." Uncle Job Sawyer explains that "after using this rule constantly for some time I began to call it my Try-Square from the similarity in the manner of its use to the little implement called by that name used by carpenters and some other mechanics to determine whether their work is square and correct." Many questions of importance are discussed in the plain talks reported as given by "Uncle Job" in a sensible, earnest way. Law, property, temperance, infidelity, conscience, death, etc., are among these questions. The book is radical in tone, but temperate in spirit and utterance.

THE ART AMATEUR for June, which is numbered 1 of Vol. XVII, appears in its new cover. This is neat and unobjectionable. But our designers must either be very fully employed, or very unskillful, if a hundred-dollar prize could bring out nothing more original or beautiful than a medallion with a head of Minerva and a ribbon string. However, the contents are good, if the outside be plain, as is often the case with many things in this world. The most valuable paper of this number is a sketch of the "Life and Works of Sir Frederick Leighton," the President of the Royal Academy, illustrated by *fac similes* of some of his drawings. The most interesting of these is a study for his painting of Cymon Iphigenia, a very beautiful female head, reclining, with the arms raised over it. There is also a study of drapery and heads from the studies for the ceiling of Mr. Maynard's

home in New York. The portrait of the artist himself gives the impression of a handsome Englishman, strong, intelligent, brave and frank, and there are woodcuts of other pleasant subjects. Beside the usual notices of saloons and art gossip, we were specially interested in an instructive note on "Composite Photography," pointing out the fallacy to which this method is liable, especially from what is called atomic inertia. A good illustration of this art is given in a composite photograph of a literary club of nine young ladies. The result is very pleasing, and tends to show that literature is favorable both to health and beauty. We might quote many bright things from this excellent number, but as we could not copy the many fine designs our readers had better get it for themselves.

A VERY lovely frontispiece illustrates Professor H. H. Boyesen's Norwegian story "Fiddle John's Family," begun in the July number of *St. Nicholas*. Other delightful illustrations of English scenery accompany Frank Stockton's "In English Country." Palmer Cox, Isabel Frances Bellows, Charles G. Leland, Mary E. Wilkins and Anna M. Pratt are among this month's contributors. The National Holiday is paid due respect to, in prose and verse.

TREASURE TROVE is one of the best as well as cheapest of the young people's magazines. In the June number, the Queen's Jubilee is commemorated by a pictorial and prose sketch of Victoria and a chapter descriptive of "Parliament and the Tower," and Fourth of July by an article on "Bunker Hill." Instruction as well as amusement is the aim of this publication. 151 Wabash avenue, Chicago. \$1.00 per year.

The *West American Scientist* says:

Germanium is an addition to the list of known elementary substances, discovered by Dr. Clemens Winkler, a German chemist. It exists in combination with silver and sulphur in agyrodite, a new mineral.

PRESS NOTICES.

Its matter is wholly original, and it is ably edited.—*Fairhaven* (Mass.) *Star*.

Some of the most able and influential thinkers of the age contribute to its pages.—*Syracuse* (Neh.) *Journal*.

It is a very interesting and instructive publication, and its articles are contributed by a bevy of writers of well-deserved celebrity. Published at Chicago, \$3 a year, 15 cents a number.—*Malden* (Mass.) *Mirror*.

THE OPEN COURT, a fortnightly journal, now established in Chicago, reaches its eighth number this week. Its elegantly printed pages are crowded with the choicest epigrammatic literature of the best thinkers and philosophical writers of the age.—*The Graphic News*.

THE OPEN COURT is the title of a new publication that reaches us from Chicago—a fortnightly review, which numbers among its contributors such writers as James Parton, M. D. Conway, John Burroughs, Felix Oswald, etc. The price is three dollars a year, and it is richly worth it.—*New England Observer*, Keene, N. H.

The current number of THE OPEN COURT, published at Chicago, contains a large array of special contributions on various subjects, able editorials on timely topics, correspondence, poetry, and book reviews. THE OPEN COURT is destined to take rank as one of the foremost of American periodicals.—*Lebanon* (Ind.) *Pioneer*.

THE OPEN COURT, a fortnightly journal, issued from Chicago, is before us. This new publication is devoted to the work of establishing ethics and religion upon a scientific basis. Those who enjoy solid reading matter, furnishing food for earnest thought, will be greatly interested in THE OPEN COURT.—*National City Record*, San Diego, Cal.

The current number of THE OPEN COURT, a fortnightly journal published in Chicago and devoted to the work of establishing ethics and religion upon a scientific basis, is full of interesting and instructive matter. Prof. Max Muller contributes an article on the "Simplicity of Language." "The Relation of the Doctrine of Population to Social Reform" is an article filled with brain food for the reformer, while the ultra-scientist would find much in Richard A. Proctor's "Common Consent and the Future Life." "Present Aims," by Arthur R. Kimball, is another splendid essay.—*Peoria* (Ill.) *National Democrat*.

The Open Court.

A FORTNIGHTLY JOURNAL,

DEVOTED TO THE WORK OF ESTABLISHING ETHICS AND RELIGION UPON A SCIENTIFIC BASIS.

VOL. I. No. 11.

CHICAGO, JULY 7, 1887.

Three Dollars per Year.
Single Copies, 15 cts.

[The second of Prof. F. Max Müller's three lectures on the "Science of Thought" is commenced in this issue. This lecture on "The Identity of Language and Thought," and the third, on the "Simplicity of Thought," not published nor to be published in England, have been secured exclusively for THE OPEN COURT, in which both will be printed from the author's manuscript. This distinguished philologist believes that language is the history of human thought, and no other man living probably is as competent as he to read this history understandingly, especially those pages which indicate how men reasoned and what they thought during the world's intellectual childhood.]

THE IDENTITY OF LANGUAGE AND THOUGHT.*

BY PROF. F. MAX MÜLLER.

ONE OF THREE LECTURES ON THE SCIENCE OF THOUGHT DELIVERED AT THE ROYAL INSTITUTION, LONDON, MARCH, 1878.

Part I.

Language, under the microscope of the comparative philologist, has turned out to be a very simple thing. With about one hundred and twenty radical concepts and twenty demonstrative elements we could build up a dictionary and a grammar rich enough to supply all the demands of Shakespeare; and surely more than that, no language can fairly be called upon to supply. I stated in my last lecture that I had succeeded in reducing all actual roots of Sanskrit, about eight hundred in number, to one hundred and twenty-one concepts, but I added that the number of concepts might easily have been reduced still further. The fecundity of these roots and the pliancy of our fundamental concepts are perfectly astounding. If you take the concept of uniting, or putting two and two together, you find it expressed by seventeen different roots. No doubt, every one of these roots had originally a more special meaning. Some meant to plait, others to sow, to weave, to bunch, to roll, to tie. But every one of them might have been generalized and afterward again specialized to such an extent that it could have supplied every verb, noun, adjective or adverb expressive of some kind of union; that is to say, one root might, if necessary, have done the work of seventeen.

Now, if I took only one of these seventeen roots, all meaning to unite, I am afraid I should spend the whole of my lecture, if I attempted to give you all its derivations in Sanskrit, Greek, Latin and English. What I wish to make quite clear to you is, how words and concepts, which seem to us quite modern, belong nevertheless to what we should call the very granite of our thoughts. The growth of our thoughts has been historical and continuous. Many of the intermediate links may have been forgotten or lost, but they were there, and it is the object of the Science of Language to restore them, and thus to furnish a safe foundation for the Science of Thought.

We shall probably consider *fashionable* a very modern word, and so it is; still it is closely connected with Latin *factio*; *c* meant originally the make or cut of a garment, whether of a raw skin, as worn by a primitive hunter, or of the most stylish sealskin dolmanette of the present season. We do not imagine that anything will have seemed what we call *queer* to the primitive and sober ancestors of our race. Still, *queer* is only the German *quer*, what runs across and out of this a name for every kind of oddity or extravagance has been formed. What we call *righteous* was originally conceived as right and straight, straightforward; and the root of right is ARG, which means to lead, to steer, from which also *rex*, a ruler, a king, *royal* and all the rest. *Gay* is the German *gähe*, literally going, or, as we now say, going it. *Vapil* is "like smoke"; *rapturous*, from *rapio*, what carries us away. *Noble*, Latin *nobilis*, from the root GNĀ, to know, meant originally "worth knowing," which gives us a high idea of the Roman nobility, at least in its first beginnings. In Kingley's expression, "one of nature's own noblemen," the original meaning is still faintly perceptible.

What I wish you to see is, that there never was any break in language, that all that is new in it is old, and all that is old is new, and that if we take any of the eight hundred primitive roots, or any of the one hundred and twenty simple concepts, we can derive from it any quantity of words to satisfy every fancy of our mind. Take, for instance, the root PAS, which in a primitive state of society expressed the act of tethering or snaring.

In Sanskrit this root helps us to express cattle; *pasu*, which is the Latin *pecus*, Gothic *faihu*, German *vieh*, cattle; also *pecunia* and *pecus*, our lawyer's *fee*. It

* Copyright, 1887, by The Open Court Publishing Co.

supplies, besides, *pâsa*, fetter, and similar words. Now, when we have a word for animal, such as *pecus*, we have also the material for expressing such concepts as *peculiar*, the transition of meaning being clear enough from *peculium*, one's private property, to *peculiaris*, anything that is one's own,—anything that is proper, singular, individual, and, it may be, odd. It is difficult to resist the siren songs of language, and not to follow her into all her flights of imagination. Every word, as soon as we hear it, carries us off to near and distant memories. They float about us like thin gossamer filaments in autumn. But we must for the present resist the temptation of catching at them, and confine our attention to a few only of the principal concepts, expressed by means of our root PAS. In Greek, then, this root does not only supply the concept of fastening, but also that of standing fast. Πέπηγα means "I stand fast," and this is a great step beyond "I make fast." We have here the constantly-recurring process of a root expressive of an act becoming a root expressive of a state. Again, what is "made fast" means not only what is compact and solid, but also what is curdled and frozen. Rime, frost, hoar-frost, all are expressed by this root; besides this, the ice, or the scum on the surface of milk,—any raised surface, in fact,—comes to be called *πίλος*, a mound, a hill, as, for instance, *Arcopagus*, the hill of Ares at Athens, and the great council held there. What is thick is called from the same root, *παχύς*, from which *pachy-dermatous*, or thick-skinned. Lastly, as we say twofold, from folding, the Greeks said *ἄπαξ*, once, literally "one stick;" German *Ein-fach*.

If we look to Latin we find an equally large harvest. Here such concepts as settling, agreeing, making peace, are expressed by the root PAS, in *paciscor*, *factus sum*, in *pax*, peace, *pacare* to pacify, and this *pacare* helps us to express the idea of *payment*, for to *pay* was originally conceived as to pacify, just as a *quittance* was a quieting. It is so difficult, as I said just now, to resist the temptation of following language through all her vagaries. But when one speaks of *quietus* and giving the *quietus*, and all that, one cannot help thinking of the different shades of meaning which so simple and harmless a word as *quietus* is able to reflect. *Quietus* in English is not only *quiet*, but also *quite*, entirely, as in *quyte* and *clene*, i. e., quietly and cleanly, that is, altogether; while the same word, after passing through French, appears once more as *coy* and *coyish*, a word of a very peculiar flavor, which can only be approximately rendered by quiet, modest, bashful or retired.

But to return to *pax* and *peace*. We find in Latin still a large number of words and derivatives all springing from the same root. There is *pignus*, a pledge, there is *página*, a page, there is *propágo*, a layer, then offspring in general; there is also *págus*, a settlement, a village, and from it *paganus*, a pagan, a heathen.

In German this root is bifurcated, being either *fah* or *fang*. Thus *fahen* in modern German is to catch, but also *fangen*, from which *gefangen*, captured, *Gefängniss*, prison. *Fähig* means able to clutch, but afterward *capable*, clever; and *Fähigkeit* is the name for talent. *Fair* has also been traced to Anglo Saxon *facger*, Gothic *fagr-s*, literally fit, then beautiful, then kind. On the other hand, *finger* seems originally to have meant taker, just as *fang* in English is a tusk or a claw. All these words are only like peaks standing out by themselves, but if we had time we should find every one of them surrounded by greater or smaller heights all leading up to the same summit. The one verb *fangen* enables us to express an infinity of thoughts in German. *Anfangen* means to begin, *Umfangen* means to embrace, *verfangen* means to catch, from which *verfänglich*, literally perplexing, as *eine verfängliche Frage*, an awkward question. *Empfangen* means to receive, *empfänglich* may express receptive, but also sympathetic, sentimental, and all that. *Unterfangen* is to undertake, but it has the by-sense of a bold undertaking.

All this is only meant to give you an idea of the enormous variety of thought that can be traced back, and, as a matter of fact, took its rise from one single root such as PAS, to tether. Whether we speak of *peculiar* people or of *peace* of mind, of *pagans* or of the *propagation* of the gospel, of a *page* of writing or of the *Arcopagus*, of *Gefängniss*, prison, or of *ein empfängliches Herz*, a susceptible heart, we do it all by means of one and the same primary concept,—PAS, to tether.

Multiply that power eight hundred times,—that is to say, take any one of the eight hundred roots and draw from them as Sanskrit, Greek, Latin and German have drawn from that one root PAS,—and you will see that a language with such a capital might be as rich as Cræsus.

We have now learned what language is, what it is made of, and we are, I think, justified in saying that it represents the simplest miracle in the world.

Let us now turn our eyes on thought. Is thought a very perplexing thing? Is it very complicated, wayward like the wind, tortuous like the convolutions of the brain, inscrutable like the sidereal nebulae? It seems so. If anything is mysterious, it has often been said it is our mind; if anything is wonderful it is our understanding; if anything lifts us above the whole of creation it is our reason. Even those who use sober and subdued language about everything else, break out into rapturous strains when they speak about the intellect and all that has been achieved by that old wizard.

I shall try to show you that nothing is so easy to be understood as our understanding, nothing so perfectly reasonable as our reason, and that the whole of our intellect, all the tricks of the wizard in our brain, consist in nothing but—addition and subtraction.

This is no new discovery, but it is a discovery that is very apt to be forgotten! One of the cleverest and most consecutive thinkers whom this country or the world has produced—I quote the words of Stuart Mill—declared, more than two hundred years ago, that thinking consisted simply in addition and subtraction.

This sounds very discouraging; but you have only to try and you will find that Hobbes was perfectly right. And not only Hobbes, but much more ancient philosophers too. Whoever it was that invented the word *cogito*, knew that to think was to combine, for *cogito* stands for *co-agito* and means to co-agitate, to bring together, to combine; and it is clear that we cannot combine two or many things without at the same time separating them from all the rest.

Whoever found out the word *intellect*, had learnt the same lesson. *Intellect* stand for *inter-lect*, and *inter-lego*, meant originally to interlace, to bind together, to combine, and that is all that the intellect is meant and is able to achieve.

Any book on logic will teach you the same lesson, namely that all our propositions are either *affirmative* or *negative*, that we can do no more than to say A is B, or that A is not B. Now in saying A is B, we simply add A to the sum already comprehended under B, while in saying A is not B, we subtract A from the sum that can be comprehended under B.

But why should it be considered as lowering our high status, if what we call thinking turns out to be no more than adding and subtracting? Mathematics in the end consists of nothing but addition and subtraction, and think of the wonderful achievements of a Newton or a Gauss, achievements before which ordinary mortals like myself stand simply aghast. To my mind nothing is greater than to see the greatest results achieved by the smallest means, and if our race has completed the work which we most admire, the temple of our intellect, by such natural processes as combining and separating, surely we may be as proud to belong to it as if we belonged to a race of giants or angels.

There is nothing new in all this, it is one of those open secrets which are not often mentioned, but which everybody knows, as soon as they are mentioned, though it may be that some people do not like to be reminded of them.

But though the process of thinking, that is of adding and subtracting, is so simple, much depends of course on what we combine or separate. Now what is it that we combine and separate? Most people would answer, we combine and separate what is given us by our senses, and they might say again, that nothing can be simpler than what we see or hear, or smell or touch. Whole systems of philosophy have been built upon what is called experience, and this so-called experience is supposed to be so obvious, so natural, so intelligible,

that nothing need be said about it. True philosophy, on the contrary, knows of nothing more difficult, more perplexing, more beyond the reach of all our reasoning powers than what is called experience. Kant's whole philosophy may be said to be founded on the question: "How is experience possible?" Here, too, the stone which other builders refused, is become the head-stone of the corner.

It is curious to see how the senses and what they give us are treated with undisguised contempt by many so-called philosophers. Do we not share our senses with the animals—they seem to say, and is it not, therefore, the lowest kind of knowledge which man possesses? Why trouble about what we can handle and see and hear? Any one can understand that, and there is much higher game for real philosophers. To me it seems, on the contrary, that there is nothing more mysterious than what the senses give us. We can understand our understanding, we can reason out our reason, but we can as little understand what we see and hear, as we can see and hear what we understand. Our sensuous knowledge, so far as its material is concerned, will always remain the standing miracle of our life on earth. So far from despising it as obvious, palpable and plain, we should rather fall down on our knees before it as the unknown, the unknowable, the beyond.

But though this beyond—what Kant calls *das Ding an sich*, must forever remain unknown, we know at least what we have made of it—that is, we know what it has become when we know it. I need not dwell in this place on the well-worn argument that we never can know a thing as it is by itself. To know a thing by itself would mean to know it, not as we know it, but as we *do not* know it, and that is clearly self-contradictory. Then what do we know? We never know things, but we are conscious of our sensations only. We first of all feel pain and pleasure, hot and cold, sweet and bitter, but that is feeling and not yet knowing. In order to change feeling into knowledge, we must first of all look upon our feelings as caused by something. There is no reason why we should do so, except what we choose to call reason, or what Schopenhauer calls the category of causality. A *tabula rasa*, a wax tablet, simply receives an impression, it does not change it into something that caused the impression. The best proof that we are not a *tabula rasa*, as Loeke and all sensualistic philosophers imagine, is that we, as soon as we receive an impression, are driven to say, "Something has impressed us." That something, however, is *our* postulate, it is *our* doing; it is simply what *we* create out of the sensations of which alone we are conscious.

But not only do we create this objective world of ours, the things, but we place them, not within us, where the sensations are, but without us, that is, in space. And secondly, we place them without us, not in a lump, but

one after another, in succession, or, as we call it, in time. Space and time are necessities of that objective world which we have created, and Kant calls them, therefore, rightly the necessary forms of sensuous intuition.

This may sound very learned, but it is really as simple as child's play. What can we be conscious of? Not anything outside us—for how should we get outside ourselves? but something within us, something that we feel, our sensations. And if we transform what is within us, into something without us, of course it must be *somewhere*—and that is what we call space, and it must be *somewhen*, if we may say so, that is it must be in time. What is nowhere and nowhen, is, as far as we are concerned, as if it were not. But when we have got so far, when we have changed our sensations into things that are supposed to cause our sensations, and when we have placed them one by the side of another, and one after another, that is in space and time, can we say then that we know them? Let us try the experiment.

I say once more, how sensations arise, how æthereal vibrations produce in us consciousness of something, how neurosis becomes æsthesis, we do not know and never shall know. But having the sensations of light or darkness within us, what do we know of any cause of darkness or any cause of light? Nothing. We simply suffer darkness, or enjoy light, but what makes us suffer and what makes us rejoice, we do not know—till we can express it.

And how do we express it? We may try what we like, we can express it in language only. We may feel dark, but till we have a name for dark and are able to distinguish darkness as what is not light, or light as what is not darkness, we are not in a state of knowledge, we are only in a state of passive stupor.

We often imagine that we can possess and retain, even without language, certain pictures or phantasmata; that, for instance, when lightning has passed before our eyes, the impression remains for some time actually visible, then vanishes more and more when we shut our eyes, but can be called back by the memory whenever we please. Yes, we can call it back, but not till we can *call*, that is, till we can name it. In all our mental acts, even in that of mere memory, we must be able to give an account to ourselves of what we do, and how can we do that except in language? Even in a dream we do not know what we see, except we name it, that is, make it knowable to ourselves. Everything else passes by and vanishes unheeded. We either are simply suffering, and in that case we require no language, or we act and react, and in that case we can react on what is given us, by language only. This is really a matter of fact and not of argument. Let any one try the experiment and he will see that we can as little think without words as we can breathe without lungs.

We may say, for instance, that we know the blue

sky, or we know that the sky is blue. But how do we know it? Nothing can be blue without us. Outside there may be millions of vibrations of luminous ether, but what we call blue is ours, just as what we call sweet is ours. Sugar is not sweet, *we* are sweet; the sky is not blue, *we* are blue. And who tells us anything about the sky? How do we know that there is a sky and that it is blue. Should we know of a sky, if we had no name for it? We have only to try to think of sky without naming it, and we shall find that sky and all that it conveys to us is gone. And so with everything else. If a language has no name for father-in-law, the people who speak it do not know what father-in-law is. They know a person who is the father of their wife, supposing they have names for wife and father, but they do not know any father-in-law. Try to teach a savage what a circle is;—you can only do it by giving him a name. You may point to a wheel;—that will give him the percept or presentation of a wheel. You may give him a rope, fastened to a pole, and making him go round, that will give him the percept of running round. But the concept of a circle, and more particularly of a perfect circle, cannot be produced or fixed in the mind, except through a name and its definition. It may be said that a geometrician can define a circle without a name, but how does he define it? Again, by means of names. If he calls a circle a figure, he uses a name; if he calls it plane figure, comprehended by a single curve line, he is dealing in names; and even if he called it a mere something, he would still be within the spell of names. We may try what we like, if we want to think, if we want to add and to subtract, we can do it in one way only, namely by names.

How is it, I have been asked, that people go through the most complicated combinations while playing chess and all this without uttering a single word? Does not that show that thought is possible without words, and, as it were, by mere intuition? It may seem so, if we imagine that speech must always be audible, but we have only to watch ourselves while writing a letter, that is, while speaking to a friend, in order to see that a loud voice is not essential to speech. Besides, by long usage speech has become so abbreviated that, as with mathematical formulas, one sign or letter may comprehend long trains of reasoning. And how can we imagine that we could play chess without language, however silent, however abbreviated, however algebraic? What are king, queen, bishops, knights, castles and pawns, if not names? What are the squares on the chessboard to us, unless they had been conceived and named as being square and neither round nor oblong?

I do not say, however, that king and queen and bishops are *mere names*.

Is there such a thing as a mere name? A name is nothing if it is not a *nomen*, that is, what is known, or

that by which we know. *Nomen* was originally *gnomen*, from *gnosco* to know, and was almost the same word as *notio*, a notion. A mere name is therefore self-contradictory. It means a name which is not a name; but something quite different, namely a sound, a *flatus vocis*. We do not call an empty egg-shell a mere egg, nor a corpse a mere man; then why should we call a name without its true meaning, a mere name?

But if there is no such thing as a mere name, neither is there such a thing as a mere thought or a mere concept. The two are one and inseparable. We may distinguish them as we distinguish the obverse from the reverse of a coin; but to try to separate them would be like trying to separate a convex from the concave surface of a lens. We think in names and in names only.

MONTGOMERY ON THE THEOLOGY OF EVOLUTION.*

BY PROFESSOR E. D. COPE.

Part I.

A disputant can have no greater good fortune than to have an antagonist who correctly understands his position, and who represents it fairly in discussion. I experienced this pleasure in reading Dr. Montgomery's review of my opinions. But this is not my only satisfaction. If I am wrong I wish to know it, and I know of no one whom I think better able to show me my error, if any there be, than a man who is at the same time scientist and metaphysician. I have been desirous of understanding the metaphysical objections to my views, and now I have them so clearly expressed that he who runs may read. And I propose to examine these objections, and, in the language of Professor Tait,† to use my "reason as best I can for the separation of the truth from the metaphysics" which they contain.

In beginning, I must make an appeal on behalf of the *a posteriori* method and against the *a priori* method of investigation; for the scientific against the philosophical and theological methods. I do this not as against Dr. Montgomery's method, which is generally, though not always, *a posteriori*, but for the purpose of explaining distinctly my own. The *a posteriori* method only can lead to a knowledge of the universe as it is; the *a priori* method leads either to credulity or skepticism; in either case to uncertainty. It is true that a system which rests on observation and inference must be, in the present state of human knowledge, incomplete. It will display unfinished designs, foundations without superstructures, and many defects incident to insufficient materials; but it will be permanent and trustworthy as far as it goes. This is all that I claim for the hypotheses of the *Theology of Evolution*, most of which have been more fully elaborated in other publications both prior and

subsequent. In these I have endeavored to confine myself to observed phenomena as foundation materials. I have not troubled myself to investigate extensively the problem of cognition, since most of the prevalent metaphysical idealism (in the modern sense) is mere verbal quibbling. Moreover, in our modern observations of natural phenomena we have not only the mutual aid rendered by one sense to another, but the corroborative evidence of numerous capable and intelligent co-workers in the field. If the observations thus accumulated are untrustworthy, as the idealistic school would have us believe, it must be admitted that there is a remarkable method in all these errors. And one of the most important results of these so-called errors is the doctrine of mental evolution as a corollary of biologic evolution, which I think gives to idealism in the Berkeleyan sense its final *quietus*.

The facts on which the theistic hypothesis rests are briefly as follows: Mind is a primitive and controlling property of matter, because,

1. Consciousness in the form of will directs, in the beginning, the designed movements of living beings, thus giving rise to habits and automatic and reflex movements of all kinds.

2. The evolution of the organs, and therefore of the entirety of the species of living things, has been primarily due to movements inaugurated in consciousness in the form of will within themselves, or to movements which are the reflex products of consciousness, all under the restrictions presented by the environment.

Both of the above propositions are amply sustained by the facts of physiology, embryology and paleontology. Two other propositions are included in my thesis. The first of these is a more remote inference from the facts than either of the preceding, and is an interpretation of them, which is indicated by the conclusions of the latter. They are:

3. The integrity of the physical basis of consciousness is, in this planet, within certain ranges of temperature, maintained by a form of energy which is not chemical, but which resists the action of true chemism. It follows that the origin of protoplasm cannot be traced to chemical energy alone, but to some energy of the vital type which must have been a property of a physical basis, not protoplasm. Hence consciousness may be a property of non-protoplasmic physical bases.

4. The hypothesis that there is no physical basis of consciousness outside of the earth, is, from the above point of view, and from a consideration of the rules of probability, so improbable as to border on the absurd.

Dr. Montgomery does not consider propositions 3 and 4, but he emphatically denies the truth of propositions 1 and 2. According to him mind in

* A Lecture by E. D. Cope. Arnold & Co.: Philadelphia. 1887.

† *Properties of Matter*, p. 47.

its various aspects is dynamically quite distinct from the material world, the two being parallel, but without mutual interaction. He finds a logical absurdity in the supposition that mind (will) controls the direction of energy, and hence of matter. For this and for other reasons he sees my system "vanish into thin air," or to lie wrecked on the rocks where so many other craft have perished. I observe just here that Dr. Montgomery runs no such risk, for he seems to have no boat of his own. Indeed, I should say, he was safely ashore, stranded among the sands of self-contradictory opinions, in which the feet sink at every step, leaving the traveler toward the truth in about the position from which he attempts to start. Thus, as a substitute for the proposition that will controls the direction of energy, he "fully admits as a leading proposition to be scientifically proved against mechanical biology, that *spontaneous* activities have played the greatest part in evolution, and that those special spontaneous activities called volitional and emanating from nerve-centers have conduced more than any other influence to realize the organic development of higher animals," etc. (Criticism, Part III.) In this passage we find Dr. Montgomery to be distinctly affirming our propositions 1 and 2, which he has previously (Part I) as distinctly denied. The two propositions are again clearly adopted (Part III, end) in the following language: "The aid which sense-perception affords to organic development cannot be overestimated; but the progressive organization to which it ministers, takes place just as unconsciously as all other organizations. * * * Only our vital spontaneity enables us to place ourselves in such relations to our medium as will best conduce to our welfare. *And we know by means of pleasurable or painful feelings which of the manifold influences of the medium are affecting us beneficially and which harmfully.*" (The italics are mine.) In the last sentence consciousness takes the lead, but in the first, progressive organization takes place unconsciously. Both statements are correct, but *appear* to be self-contradictory, and Dr. Montgomery does not furnish the explanation of the contradiction. It is furnished by the well-known fact of cryptopnoÿ, in the organization of unconscious habits out of conscious beginnings. These and other expressions show that the facts are well-known to Dr. Montgomery, but that in this instance he failed to connect them. And I interject here the observation that I find a similar failure "to connect" in several places in his Part III. I refer to assertions of the unconscious nature of various acts which he believes, with myself, to affect organism. This correct statement of oft observed facts does not, in the least, invalidate my position that the movements in question were inaugurated in consciousness. They have passed through the usual "catagenesis" by cryptopnoÿ.

I find Dr. Montgomery's position in the monistico-dualistic controversy to be somewhat difficult to define. He is neither a realistic or an idealistic monist. His philosophy appears to be of the most pronounced dualistic character, but I cannot find that he distinctly admits holding that form of doctrine. On the contrary he is at one time (Part I, p. 163) an idealistic monist opposing my "tridimensional realism," saying that the idealist can "find matter only a superfluous impediment easily argued away." In the Part III, the physical basis is treated as existent and independent. In most of his views the present writer fully agrees with Dr. Montgomery, but one difference is so radical as to throw our philosophies into fundamentally different schools. I refer to the question of the control of will over energy (and therefore matter), which the doctor denies, and which I affirm. I can also only look upon his hypothesis of the "substratum" of personality as a pure speculation in the present state of knowledge.

Having shown that my critic generously gives me a good deal of aid and comfort, I will consider his objections in greater detail. From many interesting excursions and discussions I select the following leading points of difference. Dr. Montgomery denies (1) that mind (consciousness) can direct the movements of matter. He denies (2), therefore, that consciousness is at the foundation of the direction of evolution of living beings. (3.) The "doctrine of the unspecialized" is erroneous because development of mind is dependent on organization, and because (a) the lowest animals are not conscious, and (b) protoplasm itself is not a generalized substance. That (4) a deity cannot be inferred from my premises, but mind so conceived must be inferior in attributes to that of the lowest animal.

1. *Objection to Control of Mind over Matter.*

Does mind control matter at any time and place, or does it not? Dr. Montgomery says that it does not because it cannot; and he undertakes to demonstrate that he is correct by reference to the law of physics, as follows: "In this world of ours, only matter is movable and possesses momentum. Only something which is itself movable and in possession of momentum can possibly impart motion to matter. Mind as such is not movable, and does not possess momentum; therefore it cannot move matter (*q. e. d.*)." This is a logical statement, and as such is unobjectionable. But it does not meet, much less controvert, my proposition, which I must now repeat, quoting from the *Origin of the Fittest*, p. 427-8. "The explanation" [of the control of mind over matter] "can only be found in a simple acceptance of the fact as it is, in the thesis that *energy can be conscious*. If true, this is an ultimate fact, neither more nor less difficult to comprehend than the nature of energy or matter in their ultimate analysis." In this thesis is involved the realistic doctrine that mind is a

property of some kind of matter, as odor and color are properties of the rose. It asserts also that mind is a property of matter in energetic action, or in other words that mind is a property of some kind of energy. I await with interest a disproof of these positions. If admitted, mind is a property of something which possesses momentum, and is also a property of some kind of motion. As these are the conditions essential to the communication of motion to other matter, mind can control matter (*q. e. d.*).

Of course the question that lies below my thesis may now be raised by Dr. Montgomery, so I will raise it for him. Is it "the fact as it is," that "energy can be conscious?" Since consciousness is a property, and not a substance, there is no logical impossibility in the statement. But is it the fact? for to fact we must appeal, and on fact we stand. That energy is necessary to consciousness no physiologist can deny. Stop the material basis of energy and consciousness is lost. But my critic and myself are agreed that consciousness is not *per se* a form of energy. There is then no alternative, since consciousness exists, but to regard it as a property of some kind of energy. To the kind of realist who does not regard consciousness as a form of energy identical in qualities with other forms of energy, the language I have used is the only available expression of what he believes to be the fact. It is not a mere question of words. It is self-evident that mind is not matter—or "substance") since it has no extension. It is also self-evident that beside matter and its properties nothing exists. Therefore mind is a property of matter, as color and sound (forms of energy) are properties of matter, although it forms (using it as synonymous with consciousness in the physiological sense) a distinct class or type of property. It is more exact to speak of it as a property of energy, that is, a property of a property of some matter. It seems to me that a person who cannot admit that mind, like energy, is a property of matter does not exercise what Newton called "a competent faculty of thinking."

In accordance with Dr. Montgomery's argument it is easy to prove that energy does not move matter. From a metaphysical standpoint energy is a concept as distinct from matter as is consciousness. Assume that energy is not a property of matter, and apply the formula above quoted, substituting the word energy for mind. "In this world of ours only matter is movable and possesses momentum. Only something which is itself movable and in possession of momentum can possibly impart motion to matter. Energy, as such, * * * does not possess momentum; therefore it cannot move matter."

The supposed logical difficulty of the doctrine of the control of matter by mind is further expressed as follows (Criticism, Part III): "Every biologist who introduces

into this unbending mechanical nexus any kind of deviating or directing influence ought clearly to know that he is opposing the doctrine of the conservation of energy. Wittingly or unwittingly he is professing himself an unbeliever in this supreme generalization of modern science." We reach here the point of simple assertion or denial of matter of fact. Logical as the above proposition appears to be, it is equally applicable as a negation of the most undeniable facts. Why is not any and every effect of matter on mind an equally impossible violation of the principle of the conservation of energy? If energy derived from material bases perturbs the current of mental phenomena, that energy must be, according to Dr. Montgomery's view, irrecoverably lost; it passes out of the domain of physical basis, to which it cannot ever return. Therefore matter and its energy can no more control mind than mind can control matter. Does my critic insist on the former proposition as he does on the latter? Consistency requires him to believe that matter (energy) cannot control mind, and therefore this is what I infer his belief to be. The only way out of the dilemma is to recognize that mind is a property of some matter; that it gives character to that matter, and that the energy of matter reciprocally gives character to it. This granted, energy need not be supposed to be either created or lost. *Five pounds is five pounds, whether raised by the right hand or by the left, and the will expends no more energy in doing the one than in doing the other.*

One more logical difficulty is raised by my critic, and it is a very natural one. We read, "Now, as hinted before, it is quite obvious that if memory or mental reproduction depends on specifically organized structure,—a state of things generally accepted as a fact by evolutionists,—then specifically organized structure cannot reciprocally depend on memory or mental reproduction. This would be out of the question, even if mental states were capable of influencing the physical nexus. A certain something cannot possibly be at one time the produced effect of something else and at another time its producing cause. The relation cannot be reversed." Inasmuch as the process of education of men and animals is, by implication, denied in this paragraph, let us see whether there is not something wrong about it. The difficulty with it is that the fact of mental digestion, or organization of the sense-perceptions, is omitted. Experience accumulates sense-perceptions which are arranged in revived consciousness in various orders of likeness and unlikeness. It is a fundamental quality of memory to be "aware" of like things at the same time, and of unlike things at different times. Out of these classifications come the appreciation of cause and effect, and out of this appreciation come designed or appropriate acts. Out of acts (motions) come structure; and structure comes out of every stage of the activity from its beginning,

as well as from its ending. Up to the moment that the motion enters the control of will, matter and non-living energy are in command; so soon as it reaches, and after it leaves the dwelling-place of will, mind is in command. And the ultimate result is new motions, which bring us new sensations, new classifications, new will-directions, and new motions again. So mind and matter pursue their eternal interaction. Simple matter produces simple consciousness. Consciousness complicates itself by means of memory, and in the act turns on its physical basis and complicates it. I take it that these are the facts, and logic must use them, since they are incontestible.

I add, in conclusion of this part of the discussion, that I do not adopt the opinion that mind can control matter *a priori*, but *a posteriori*, as an inference from the observation of innumerable facts. In our daily experience we observe that it is mind that adapts matter to itself and itself to matter, and not matter that adapts itself to mind. Mind is the more variable element of the two, and the modifications it produces are intelligent, which is not the property of non-living matter.

2. *Objection to Direction of Evolution by Mind.*

The position that consciousness and will are properties of matter is reinforced from all departments of psycho-physiology. What can be more convincing in this direction than the phenomena of memory? But equally satisfactory evidence is seen in the formation of habits, or modes of animal motion. These betray a mechanical structure of the physical basis, which could only originate under conscious conditions. Such an arranging of matter is an exhibition of energy; and that energy that wrought such special structure from pre-existent structure, or no structure, *did so for reasons*. It exhibited that admirable property which Dr. Montgomery well defines as an "inner-awareness of what takes place independently of it." But his views do not permit him "to insinuate mental effectuation into the physical nexus (p. 163). He tells us that "mind as such" * * * "cannot alter a jot the path of material particles * * * This means *according to our present scientific conception*, that it (the path of particles) is absolutely predetermined by the previous physical disposition of the molecules and their motion." This is a denial of the fundamental law of evolution, that structure is modified or produced by use. That evolution builds on foundations already laid is, of course, true, but that "the motion of particles is *absolutely* predetermined by the previous physical disposition of the molecules and their motion" is in contradiction of the logic of progressive evolution. There can be now no kind of doubt that use has produced structure in animals by additions to and changes in "the previous physical disposition of the molecules and their motion," during the ages of geological time. Use is a form of motion, and

motion is directed by consciousness in the form called will. Therefore, "mind as such" has "altered the path of material particles," and has produced new organic structures out of them, however incredible it may appear to my amiable reviewer. This is a statement of an apparent fact of the history of life and mind on the earth, and it will require some further evidence to convince me that the appearance is deceptive than the statement that it is impossible. The advancing development of brain throughout the ages, is not the least important part of the evidence that the mind, conscious and unconscious, has been concerned in this evolution. I believe that in past ages as now, use developed the mechanism and size of the brain, and that it followed inevitably, then as now, that the most intelligent animals provided better against the vicissitudes of life than the less intelligent, and that they thus survived. That this is true is indicated by the history of the ancestors of man. Without the weapons of offense or defense, or the mechanism for speed or concealment possessed by the animals of other lines, they survived, and lo! they now inherit the earth!

(TO BE CONCLUDED.)

A NOTABLE PICTURE.

BY RAYMOND S. PERRIN.

Any one who has been in the National Gallery in London, will doubtless recollect the painting of "The Trinity," by Pesello, 1422. If the person who sees this painting for the first time has thought much about God, it will make a very deep impression on him—an impression which will be pleasant or unpleasant, according to the conception of deity the beholder has formed. God, in this picture, is presented in a sitting posture holding in his extended hands the bar of the cross upon which Jesus is nailed. Four centuries have not dimmed the crimson of the blood that trickles from the wounds, nor the deathly pallor of the skin, nor the wonderful life in death of the sufferer's face. The Holy Ghost, in the form of a dove, rests upon the bosom of the father and watches the son without any sign of consciousness of the terrible tragedy. A crimson devil and many angels, in the form of birds with human faces, hover about the cross. God wears a hat resembling somewhat that of the Pope of Rome. His face bespeaks a man simply intent on his purpose. It betrays no pity or other emotion. The artist seems to have been content with the single trait of firmness in repose. Not even thoughtfulness or intelligence is attempted. The garb and attitude are those of a ruler. All the attributes of despotism are suggested. Jesus wears his customary expression of resignation to torture. He looks neither suppliant nor reproachful, nor even tender. The artist attempts nothing but patience and pain. The Holy Ghost, as above intimated, is disappointing, that is to one reared in the reverence of Christian spirituality. We generally think of ghost as

meaning spirit, and of spirit as meaning mind; whereas, this dove does not suggest any inspiration whatever. It is a strain upon the imagination to look upon it. It is entirely out of place, for there is nothing in dove-like feelings known to us which can be woven into the relationship here depicted between father and son.

The devil and the angels are zoölogical inceptions of great originality. But has not the independence of morphological sequence displayed in these singularly constructed beings a manifest connection with the disregard of moral sequence displayed in the whole picture? Surely the scheme of human salvation as here portrayed is not a moral one. There are many things which can be said in favor of the love of God for humanity—a love equal to the sacrifice of his son—but it seems evident that the son is not duly considered. In all moral relations, as far as we know, human beings constitute the terms. It may be perfectly moral for Gods to sacrifice one another, but humans are only able, in justice, to sacrifice themselves. Our sacrifices must be personal to have any merit. We may advise one another to be self-sacrificing, but the moment we employ force in the matter the relation becomes one of injury and must be judged accordingly. If God only advised Jesus to sacrifice himself, the artist has been singularly unfortunate in presenting the relations of his subjects; for force, unrelenting force, is the one motive which the attitude of God in this picture expresses. Of course Christianity cannot be held responsible for the artist's conception.

In this figure of theological belief there are, no doubt, possibilities which it would be rash even to consider. The persons presented are Gods, not men, and how are we to judge the conduct of Gods? All we can do is to determine whether it would be right for a human father to force his son to sacrifice himself for others? We think the proposition is a contradiction in terms. It is impossible to force any one, perhaps even a God, to sacrifice himself. We must change the wording in order to make the question rational. Is it right for one of us to injure another in behalf of some one else? Here is a very simple problem in conduct. The laws of every civilized people are entirely made up of provisions against such a contingency—such an infringement of personal liberty. None of us have a right to determine to what extent we may injure another, no matter what our ultimate aim may be. We have no right, as individuals, to injure any one under any circumstances. Speaking for men, this is the old basis of law and morality. As to Gods, that is another thing. Injuries among Gods is a question fraught with insuperable difficulties, for the relations of divine beings, as far as they have been disclosed to us, seem to involve more or less injury to one another. All that we can safely say concerning the conduct of God is,

that divine sacrifice is always self-sacrifice. When it is transferred from one divine being to another, it becomes of necessity injury, pure and simple.

If we could only discover to what extent Gods may injure one another, without infringing upon justice, we would indeed be wise. Such wisdom might remove a great deal of unhappiness, not to say misery, from the world.

But we must not be too sanguine. The relations of Gods among themselves will ever be a mystery to us, for we have no knowledge of the terms of the relationship, and there is no hope of obtaining such a knowledge. All we can hope for is to distinguish between divine self-sacrifice and divine beings sacrificing one another, or more correctly speaking injuring one another. This distinction, I think, we can clearly make out even with human eyes. Of course, from our standpoint, there is much to be said in favor of that delicacy which discourages investigation into the subject. To measure the injuries which divine beings may inflict upon one another for our exclusive benefit does seem somewhat obtrusive on our part. The injury, in the opinion of many, is not only useless but would be ungracious and profane.

What a power is art to produce so many impressions and reflections as this picture of the Trinity must, in those who pass before it. Coming down from a distant age it portrays the beliefs of the past. How thankful we may be that we have at last risen above the level of thought and feeling which the artist and his contemporaries occupied. Who, in our age, would think of preaching the religion, or of teaching the morality set forth in this picture? Who would think it possible, now that our emotions are classified and measured and their sources understood, to hesitate before such a simple moral question as whether it is right to injure another in order to carry out our ideas of good?

In thus felicitating ourselves, however, it would be well to remember that though the barbarous notions of conduct which this picture presents are safely buried in the past, we are not, as yet, entirely exempt, as a nation, from the tendency to materialize or limit our notions of deity. God to us, it is true, is no longer a person, for the sciences have taught us that personality means limitation, and that, therefore, God must be the universal principle or fact, not an individual. But we are continually neglecting this generalization, placing in its stead images of conduct. Is it not humiliating to us, that these images are not as we supposed symbols of virtue, but types of error, immoral examples?

God is the motive of the universe, and knowledge of God consists in our appreciation of divine or general motives in their true proportions. This is simply to raise the mind above the limits of human character, of

which theology is merely a reproduction in grotesque form, to the empire of universal cause and effect. To do this we must become truly spiritual. We must exchange for a true knowledge of life our dreams of immortality. We must make conduct the measure of life as well as of happiness, for in our actions alone we live. This will prevent us from putting our faith in beings, or the representatives of beings, who are known to us only through the contradictions and absurdities of their conduct.

A MODERN MYSTERY-PLAY.

BY M. C. O'BYRNE.

In Wright's *Essays on Archæology* the curious reader will discover some amusing examples of the gross anthropomorphism of the Christians of the middle ages. Nowhere were religious conceptions coarser or more grotesque than in England and the Lowlands of Scotland, among those whom Dr. Robert Knox terms the "spatula-fingered" Anglo-Saxons,—perhaps the most unabstract of European peoples. Of course Mr. Herbert Spencer, while "binding the universe up into bundles,"—as poor Carlyle said of Comte,—has not omitted to notice these gross mediæval conceptions. By education, no less than by temperament, Mr. Spencer is unable to recognize that the apparent incongruities "between religious beliefs and social states,"—in the middle ages at least,—would appear perfectly congruous to a Roman Catholic, even to its latest and perhaps most scholarly champion, Mr. W. S. Lilly. The mystery-plays of the dark ages, though certainly very much grosser, were not a whit more anthropomorphic than is the Passion-play of the Bavarian hamlet Oberammergau, which crowds of refined ladies and gentlemen, both of England and America, throng to witness and to which columns of descriptive articles have been devoted by the most respectable and influential London newspapers. That the old plays were exceedingly broad pictures, as Wright terms them, is most unquestionable. Nevertheless they *were* pictures, and at their inception they were intended,—as Pope Gregory the Great said of religious paintings,—to serve as *idiotarum libri*, or books for the illiterate, and, doubtless, from the Catholic standpoint, they admirably fulfilled the function for which they were designed.

The methods pursued by the Salvation Army are those by which Christianity was quickened immediately after the crucifixion and disappearance of its protagonist, the enthusiastic Galilean. I have studied those methods at the old headquarters of the Army in Whitechapel, London, where I have been enabled to realize the immense effect produced on the popular mind of England by that Antinomianism which was the moving doctrine of the reformation. Side by side with this

outbreak of fanaticism, however, another,—and I think a much more praiseworthy,—movement was being conducted in a contiguous district of the teeming East End of the great city. Old Gravel Lane runs across the London dock, and connects Ratcliff Highway,—now more genteelly called St. George's East,—with High street, Wapping. I need hardly add that all these are historic places, grim and forbidding though they now are. Though shorn of its ancient pre-eminence by the removal of the larger portion of the shipping to the newer and more eastern docks, this region is still sacred to sailors, crimps, dance-houses, liquor saloons and brothels,—a *terra incognita* to the respectable citizens of the great metropolis. The wretched courts, alleys and by-ways that spread from it on either side are inhabited by laborers and their families, nearly all of whom are of Milesian extraction and who constitute the most numerous portion of the Irish colony in London. I, myself, have often heard the original language of Connemara spoken in this district, and I still remember an evening spent in Ratcliff, when I listened with as much delight as Borrow, the "Romany Rye," to wild legends of Fingal, Grace O'Malley and Brian Boroimhe, sounding strangely out of place in this Gehenna of squalor, misery and vice. The men earn a precarious and wretched subsistence by their chance employments in the docks. Every morning the gates are opened, while an official "takes on" the number of laborers deemed necessary for the day, either in the wine vaults, on the warehouse floors, or on the quays. Each man receives a metal ticket, with the hour of his entry stamped on it, and his name is entered in the "taking-on book" opposite the number of his ticket. The feverish impatience and anxiety of the crowds who linger near the gates are generally very painful to witness, and very few of these administrators to the wealth of this overgrown metropolis average more than three days a week of regular employment throughout the year. The young women and girls are employed in sack making at their own "homes," and at any time scores of girls, having forms that a duchess might envy, may be met on the streets with heavy piles of rough sacks on their heads. Being only "London Irish," of course no artist has gone out of his way to paint them. They are by far too vulgar for the gallery of the aristocrat or the merchant prince, whose costly canvases have more than enough of Italian and oriental women with water-pots and vases on their heads and shoulders.

Vulgar and vicious as this district is, it was, nevertheless, the region selected to labor in by the most self-devoted priest that has ever adorned and honored the Church of England since the death of George Herbert. "Man is born to be a doer of good," wrote the Emperor Marcus Antoninus,—a maxim which did not govern his own conduct with respect to the rising sect of Christians.

Let us, whatever we may think of its doctrines, honorably and gladly acknowledge that Christianity has from its inception inspired and stimulated a refined and elevated altruism. The self-sacrifice of such men as Herbert, Mompesson and Lowder reflects honor on humanity none the less because their noble exertions were in a great degree prompted by their religious convictions. "St. Peter's, London Docks," is situated in Old Gravel Lane. It was for many years the church of the Rev. Charles Lowder,—“Father Lowder,” as he was called by his affectionate parishioners. Defying alike the prejudices of his co-religionists and the hostility of the people among whom he volunteered to labor,—these being nearly all, at least in name, Roman Catholics,—Father Lowder openly put in practice the highest ritual allowed him by the law, caring, indeed, little or nothing for judicial committees or for any secular court or ordinance appointed by the State to restrain High Churchmen from excess of zeal. My pen almost shrinks from the attempt to describe the nauseous impurity and bestiality of the denizens of these riverside purlieus. Morning, noon and night the mind of this educated and refined gentleman must have been shocked by his surroundings, the very children playing in the gutters using all unconsciously the vilest language of the brothel. Throwing aside fastidiousness, this grand humanitarian devoted himself to the reclamation of the district. Corpus Christi and other processions wended their way, under his guidance, down the Lane, into Wapping, and along the courtesan-haunted Highway, while the services inside the church were of the very “highest” order possible. For a long time the people did little but scoff at the zealous priest, now and then, however, manifesting, in a way that called for the interference of the police, that they were Roman, not Anglican, Catholics. Gradually, however, as it was found that Lowder's religion was a practical one, embracing works of mercy, kindness and charity; when it was seen that willing hands were extended to rescue the fallen, and that agencies were established to promote the welfare of the poor, to encourage temperance and thrift, and that St. Peter's was truly a “light shining in a dark place,” the demeanor of the “natives” was changed. Then it was, too, that the Roman Church, which claimed the allegiance of these outcasts, awoke to the recognition of the fact that Ratcliff and Wapping were not in Tasmania or at the north pole, but at its own door. Henceforth a little of the attention that had been confined to netting big fishes among the aristocracy was bestowed on East London, and Henry Edward, of Westminster, appears to have found the locality on a map, and, having found, made a note of it.

St. Peter's and its various agencies,—including even a dining and coffee-house for laborers,—has thrived wondrously. Except in the Hall of Science, Old Street,

the headquarters of the Secularists, there is no other example of the rapid growth of a congregation composed mainly of the laboring classes. “Father” Lowder died,—I think about four years ago,—but the work still continues vigorously as when he was alive to conduct it, his example having encouraged others to follow in his footsteps. Unlike the Salvationists, whose frenzied appeals to avoid “the wrath to come,” and lurid pictures of hell-fire temporarily excite the ignorant mind only to provoke a terrible reaction in the direction of sensual indulgence and profound debauchery, the Ritualists of East London have worked entirely on what I may term pre-Reformation lines. Among other things they have had recourse to as means of instruction, is a modification of the passion-plays. Unlike the peasants of Oberammergau, the authorities at St. Peter's are mindful of the Horatian advice not to “introduce on the stage things that ought to be enacted [*i.e.* supposed to be enacted] behind the scenes.” Of course this circumspection is a concession to modern progress, and it indicates, as Mr. Spencer would say, the ever-increasing incongruity between religious beliefs and an improved social state that the conception of the Virgin Mary or the crucifixion of her son would not now, be made the subject of a tableau either on a public or private platform in England.

From notes made at the time, I am able to describe one of these revivals of the mystery-play. The author, or more properly the composer, was the Rev. Charles Lowder himself, and, of course, his main object was to enable his congregation more vividly to realize the salient events connected with the incarnation and early life upon earth of “the Son of God.” The play opened by the Choragus (“the master of plays”) and chorus, consisting of twelve ladies attired in loose white dresses, six of which were ornamented with blue and six with pink trimmings. These recited the prologue, after which the curtain was drawn and a tableau representing “the Annunciation” appeared. This was followed by the “Nativity,” the “Adoration of the Shepherds,” the “Presentation in the Temple,” the “Flight into Egypt,” etc. By far the most effective tableau was that of the simple house and work-shop of the carpenter Joseph, showing Mary carding flax, the child Jesus with a broom in hand, and Joseph himself at a rude work-bench. Quite as reverently as though engaged in regular worship the chorus sang a hymn, from which I cull the following verses:

“Sons of Adam, sons of sorrow,
Would ye wis who is this
Laboring at Nazareth?”

“Very God, the angels call him,
And adore, evermore,
Bending low before him.

"Very man, yet now behold him,
Mary's child, meek and mild,
Called the Son of Joseph.

* * * * *
"Know'st thou what it is to hunger,
Barely fed with daily bread?—
Jesus, too, did hunger!

"Know'st thou what it is to labor,
Toiling on till youth is gone?—
All his life he labored!

* * * * *
"Is thy labor very lowly?
Brother, see, at Nazareth he
Swept the floor for Mary.

* * * * *
"Man! whate'er thy lot and station,
Rich and glad, or poor and sad,
God was Man at Nazareth!"

The reader will, I think, agree with me that there was nothing ridiculous or what the most rigid Evangelical Christian would regard as profane in this gospel-play. Doubtless it was conceived, as it was most certainly represented, in a spirit of religious reverence. In this respect it presented a marked contrast no less to the ribaldry of the Salvation Army than to the coarse buffoonery of the mediæval passion-plays. The object aimed at was to bring the doctrine of the Incarnation before the people in a manner best calculated to permanently impress them with its significance. The old Romanist method, on the contrary, tended to bring religion into contempt, and thus, in some measure, it prepared the way for the great Protestant revolt. What, for instance, could be more absurdly ridiculous than the Festival of the Ass, formerly celebrated at Beauvais? In commemoration of the patient animal upon which Joseph and Mary were presumed to have fled into Egypt, the people of Beauvais used once a year to caparison a donkey in cloth of gold, and place upon its back a richly-dressed maiden, to represent the Virgin Mary. A long procession of priests and people conducted these from the cathedral to the parish church of St. Stephen. Girl and donkey were placed near the altar, and during the celebration of high mass the well-trained animal was compelled to kneel at the most solemn parts of the "sacrifice." Du Cange (Book III, pp. 426, 427) has preserved the hymn, with its French chorus, which some not-too-faithful an interpreter has rendered into English, some specimen stanzas being as follows:

"The ass comes hither from Eastern climes;
Heigh-ho, Sir Donkey!
He is handsome and fit for his load at all times.
Sing, Father Ass, and you shall have grass,
And straw, too, and hay in plenty.

"The ass is slow and lazy too;
Heigh-ho, Sir Donkey!
But the whip and the spur will make him go.
Sing, Father Ass, and you shall have grass,
And straw, too, and hay in plenty.

"The ass was born with stiff long ears;
Heigh-ho, Sir Donkey!
And yet he the lord of asses appears.
Sing, Father Ass, and you shall have grass,
And straw, too, and hay in plenty.

"At a leap the ass excels the hind;
Heigh-ho, Sir Donkey!
And he leaves the goat and the camel behind.
Bray, Father Ass, and you shall have grass,
And straw, too, and hay in plenty."

"The worship," writes the Rev. H. Christmas* "concluded with a mutual braying between the clergy and laity in honor of the ass. The officiating priest turned to the people, and in a fine treble voice, and with great devotion, brayed three times like an ass, whose fair representative he was; while the people, imitating his example in thanking God, brayed three times in concert."

This was truly an edifying act of worship, and one which Pope Leo XIII might do well to re-establish as a sort of complement to the dogma of papal infallibility, by voting for which on the 18th of July, 1870, five hundred and thirty-three Catholic bishops brayed in accordance with the papal mandate.

In England the so-called Catholic revival,—not the Roman Catholic be it noted,—is extending itself downward as well as upward. How far miracle-plays will help to recover the masses I cannot state, but it is noteworthy that the national church is sparing no effort both to ameliorate the physical condition of the people, to improve their morals, and to counteract the rapid growth of skepticism. It has one association,—the Guild of St. Matthew,—specially designed to confront the Secularists, and which endeavors to meet them rationally and admits them to its platforms in fair and open argument. In so doing it has, I believe, challenged and obtained the respect of Mr. Bradlaugh, who desires nothing better than that the conflict between Secularism and Christianity shall be conducted more generously and courteously than in the old time of vituperation and abuse.

FAILURE OF THE RADICAL METHOD.

BY REV. JULIUS H. WARD.

The recent convention of the Free Religionists, in Boston, representing, as it does, the dregs of the great reform era in New England, furnishes a curious illustration of the change which has been slowly creeping over American life since the close of the civil war. This association of radical people was organized twenty years ago in order to bring the protesters against conservative religious life together. It succeeded in this, and numbered its members in all parts of the country, but found them chiefly in New England. Since then it has furnished yearly, if not oftener, a free platform for the

* *Shores and Islands of the Mediterranean*, Vol. 1.

expression of opinion on current religious and social questions, and has proved to be a clearing-house for ideas which found little favor in the press or in the churches. It has been its special aim to be a voice in the wilderness, not to be an element of organized life in the community. It has held the seat of critical judgment, but has done little to forward either needed reforms or the helpful operations of civilized life. Meanwhile, there has been a gradual change in the way of looking at society and in the method by which social results are reached. The old method of agitation has been replaced by a broader view of life and of the relations which men bear to one another in the advancement of the world. The agitator has been found to be simply an individual. He is nothing more than a unit. He carries no more influence than the strength of his utterance or of his will. He is powerless in present society unless he can organize others to work with him. The demand to-day, if any great end is to be reached, is that a few persons shall associate to further an object, and that its method shall be one that is in accord with the institutional order. It is not simply a question of individual rights, but the moving of the community as a whole to think as you do. Once it was an emphatic protest, and the voice in one wilderness resounded to the voice in another; now it is the union of men and women together for the furtherance of a common object.

The Free Religious Association is a notable illustration of the working of this principle in American society. It began as a protest; it was an association of the Puritans of the Puritans; it struck the ax unsparingly at the root of the tree; it believed that the denunciation of what it did not approve was all that was required. The time has come when this negative position is no longer profitable. Mr. O. B. Frothingham attempted to maintain this position in a congregation in New York and found it an impossible task; Professor Felix Adler has only succeeded in doing this by connecting it with an organized system of philanthropy. The organ of this movement has now been merged in a broader journal which has its own way of expressing the affirmative positions of the Association. The center of the Free Religious movement in Boston, which was to have been in the support of Theodore Parker's society, has long since disappeared, and nothing but the unsightly building, which is now his empty memorial, remains to suggest to the passer-by that Free Religion in Boston once had a local habitation as well as a name. This has been partly due to the negative positions which this company of people assumed. It is due still more to the change in the life of society, so far as men have purposes in hand by which it may be redeemed. This was openly confessed by Rev. W. J. Potter, the president of the association, at its recent convention in Boston, when he openly laid before its members a scheme of associated

secular, scientific and religious work, by which its life might be revived and its usefulness made evident to the world. This plan is similar in its method, if not in its scope, to that of the Social Science Association, and it is the expression of that rational interest in humanity at large which the Free Religionists have assumed to have at heart. What will come of the scheme remains to be seen; it has not apparently been received by the rank and file with that cordiality which should ensure its practical success, but it seem to be the only channel by which the Free Religionists as a body can put themselves *en rapport* with the moral and religious forces which now control the better elements in American society. It would appear that even the come-outers from organized religion are compelled to fall into lines of sympathy and union with the institutional order from which they have heretofore most vigorously dissented.

COMPETITION IN TRADES.

BY WHEELBARROW.

A short time ago the president of the Federation of Trades Unions testified before the Senate Committee on Labor. I see by the papers that he proposed as a remedy for the alleged wrongs of journeymen mechanics, that the convicts in penitentiaries, instead of working at trades within the walls, be taken out and worked upon the public roads. On behalf of the "knights" of the shovel and wheelbarrow I protest against this plan. What right has the Federation of Trades Unions to dump—I use a term suggested by my profession—what right has that federation to dump the whole convict "brotherhood" upon us? What right has the president of it to make his class an order of nobility to flaunt their airs of eminence in the faces of us who labor in a lower calling, who have not reached the rank of mechanics, but who must content ourselves with the honorable but yet inferior designation, "laborers"?

The president of the Federation and his order get higher wages than we laborers get; they can better afford to stand the competition of the convicts than we can. We who "work upon the roads" have just as much right to protection against convict picks and shovels as the president of the Federation has to protection against convict chisels, awls or jack-planes. Will he give us some good reason why convicts should be permitted to compete with some kinds of labor and not with others? Are we to have an aristocracy of trades?

I never had time to study the principles of political economy, and I know nothing about the laws of social science, but the facts of both have fallen upon me heavy as a hammer, and upon the stern logic of those facts I built my own ethics of labor in those delightful moments when, having dumped the load, I leisurely trolled my wheelbarrow behind me down the plank to the hole in the ground where it had to be filled again. Sixteen

hours a day of hard work is bad schooling for a boy of thirteen. In the bright days of childhood, when the mind and body should grow into strength and beauty, mine were being stunted and warped by toil savage and unnatural. I ought to be five feet ten; that's my correct stature by rights; I am less than five feet six. Toil stunted me when I was in the gristle. I had no time to study books, and the principles of life that I learned, such as they were, I had to gather in the college of hard knocks.

After all, a man can think with considerable clearness walking down a plank with an empty barrow behind him, and I have worked out hundreds of labor problems while "walking the plank" in that way. Some of my solutions I afterward threw away as incorrect, and others I cling to still. The open air is a good place for mental work; a clear atmosphere makes clear thought, while the inspiration of a few big draughts of t into a good pair of lungs quickens the mind. You don't get your full ration of oxygen in the house; out of doors you do, and that is a wholesome stimulant better than wine. You can unlearn a great many things, too, in the open air, and one of the useful arts is that of unlearning. I have unlearned many of my theories about labor, and some of my doctrines I have been compelled not only to change but to reverse. The effect of labor competition upon the welfare of workingmen appears to me now in a different light than it formerly did, and I am satisfied that we must reverse our ancient opinion that it is desirable to produce a scarcity of men, a scarcity of skill, and a scarcity of production. So long as we cling to those old superstitions we can never successfully assert the dignity of labor.

Already they have reduced labor to a mendicant condition. It begs for favors where it ought to compel rights. The beggarly petition "a fair day's wages for a fair day's work," is unworthy of straight-built, square-cut men. Let us shape the laws of this land—social and political—so that we may obtain a reward for our labor equal to its full value. We are leveling wages to the grade of alms, and our masters pay it to us like the dole of charity. If we take a narrow view of human life our share of life's comforts will be narrow and mean. We must expand the horizon of man, and not contract it. What can be more degrading to labor than the assumption of the Federation that the hosts of workingmen in Illinois cannot stand the competition of a couple of thousand prisoners bungling at the tasks imposed on them for punishment? The welfare of the workingmen can never consist in the scarcity either of talent or goods, but always in the abundance of both.

Men like the president of the Federation fight the beneficent law of mutual assistance under the impression that they are fighting competition by limiting human skill. So they foolishly resolve that all handicraft shall

be a monopoly; they put "mechanics" back again among the black arts, and forbid the teaching of trades. Not only would they set convicts to "working on the roads," but all the children of the poor. I have four sons, all free-born Americans, so-called, and all now grown to manhood. I tried to give them trades, as they respectively reached the proper age, but in every instance I was forbidden to do so by the laws of the trades. All four of them are now men, but not one of them was permitted to learn a trade in the land where they were born and which they have been taught to call a land of freedom. The oldest got a job as fireman on the railroad, and after a few years managed to steal the trade of an engineer; the next drifted off to that undefinable country known as "the mountains," and there he is wasting away his life digging holes in the ground searching for silver and gold. The next picked up a book and taught himself the shorthand trade; he gets twice as much wages as I ever got with my wheelbarrow and shovel; the youngest gets a dollar a day in a store in the humblest capacity, but hopes to work up in time to the grade of a clerk. That all four of them didn't become hoodlums and tramps is not the fault of the unions. A man with a heart in him, even if he has no brains at all, must see in a moment that the policy which robbed those boys of their right to learn a trade cannot be right, and not being right it cannot be either economical or wise.

One evening I was talking to that shorthand writer about the strike of the telegraph operators, supposing that he would probably take a deep interest in the subject, but he cared little about it. "I hope the operators will win," he said, "but I am not anxious either way. It's a choice of monopolies, and I side with the weaker. The companies monopolize the profits of telegraphing, the operators monopolize the art. They forbid one another to teach the trade, and if their monopoly is beaten by the other it will be no more than the big pike swallowing the little one."

I look at it that way myself, and it appears to me that if the policy of shutting up one trade in order to prevent competition is good for that, it must be good for every other calling or profession, and all the trades and occupations being closed, the people outside must be either rich, or tramps, or thieves. The trades having shut everybody out, have shut themselves in, and having deprived a large part of the community of the means of buying anything, trade diminishes, there is less demand for labor, and less money to pay for it, another exclusion then becomes necessary, until we get back to the wigwams, where we don't need any mechanics at all. We might follow the principle to greater extremities yet, until at last we grub roots or climb trees for a dinner, like that primeval ape from whom we all have sprung. I think it is in the story of *Rasselas* that I read

an account of an ambitious man who was promised by the genii the fulfillment of one wish, whatever it might be. He wished that he could be the only wise man in the world, and that all other men might be fools. The wish was granted him, and immediately afterward the people took him and said, "this man's a fool," and they put him in the lunatic asylum, where he remains to this day. He was a fool, and so is every man a fool who thinks to grow wise on his neighbor's ignorance, or rich on his neighbor's poverty.

I object to the principle for another reason. It fosters the spirit of caste among workingmen, and creates a ragged aristocracy, the shabbiest aristocracy of all. In a gang that I worked in once was an Irishman named

Jack Patterson; an honest man was Jack, and as true a gentleman as ever swung a pick. He had a son named Dick, and how he managed it I don't know, but Dick broke through the crust that excluded him from the trades, and learned the art of a plasterer. Being now a mechanic, he occupied a round on the social ladder one step higher than we did who worked with a shovel and a pick. Having attained this giddy elevation Dick refused to associate any longer with his father. A friend condoling with his mother on Dick's unfilial conduct, the old lady replied: "Well, Dick always was a high-spirited boy; sure, you couldn't expect him to associate with an Irish laborer." The Federation of Trades Unions would make Dick Pattersons of us all.

THE CREEDMAN.

BY MRS. ELIZABETH OAKES SMITH.

I do not much affect a human creed,
 And yet there sometimes comes to all a need
 Of voice, authoritative—stern
 The straight from devious way to learn.
 Ah! it were well, indeed, could we
 But half those ancient Creedmen saw, but see—
 Had we but half the reverential awe
 By which they sought to find a binding law.
 They hid themselves in caves and deserts wild,
 Where God was felt a presence—man a child—
 And everywhere a voice within was heard
 Rung from the Heavens down—"Thus saith the Lord."
 Ah! ye by sense and passion blindly led
 Behold the Creedman on his rocky bed,
 Weak from the sackcloth, and the stripes that bleed
 Down from the brain and heart, as grows the Creed;
 A needful balance to the wayward mind—
 A needful check—or bondage for mankind.
 And we reject it all—and feel no shame,
 We, who are what we are, because the Creedman came,
 And crystalized to form the mighty word,
 That all the Heavens proclaim—"Thus saith the Lord."
 'Fore God I bless his name, that such have been—
 Forgive the blindness, and the deadly sin
 Of persecuting priest, and burning stake
 That taught men how to die for Truth's dear sake;
 That through the darkness to Servetus spake,
 And like a burning flame on Bruno broke;
 And we reject—but unto such we owe
 The thought that taught us how to dare—and know.
 Through the dim forest and the pine tree shade
 The lightning leaps—the storm a path has made—
 All Nature echoes to the mighty word,
 Through all her secret caves—"Thus saith the Lord:"
 But most within the heart of man is heard
 This grand monition of the sacred word,
 "Thus saith the Lord" inscribed within,
 Stern as is Duty, at approach of Sin.

THE OPEN COURT.

BY NELLY BOOTH SIMMONS.

Ah, many a *Court*, I know, have we,
 Where men may gather and witness bear
 To their faith, and tell of the wrongs that be,
 And how to render the world more fair;
 May seek to unravel this endless strife,
 And speak, with eager yet bated breath,
 Of the meanings and uses of human life,
 And the strange, sad mystery of death.
 But none so grand, so free as *this*,
 Where creeds can never the light eclipse, —
 No Bible held for a reverent kiss
 E'er truth may be uttered by earnest lips!
 Where all may come who would intervene
 To crush the evil, to aid the weak,
 And Reason sits, like a judge serene,
 Giving her verdict on all who speak.
 Ah, strength comes soonest to those who know
 That doubt is the sunrise of the soul,
 Who let the priest and his dogmas go,
 And read from the leaves of Nature's scroll;
 Who are brave to differ, and bold to mine
 'Neath the crumbling walls of the ancient church,
 Till the rays of the gems of truth divine
 Gleam out to guerdon the patient search.
 Then never falter, or stand aloof
 From the hearts that meet and mingle *here*
 Where belief is based on a rock of proof,
 And Love is the God held ever dear;
 Where to all is given the right to speak,
 To question, aye! and to disagree
 As fellow-searchers for light on a brink
 That is washed by the waves of an Unknown Sea.

Articles of great interest by several distinguished thinkers, both European and American, who have not yet contributed to *THE OPEN COURT*, will soon be presented to our readers in these columns.

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixon Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of THE OPEN COURT is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to THE OPEN COURT should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, JULY 7, 1887.

THE CASE OF PROFESSOR EGBERT C. SMYTH.

The Boston *Post* says that in Andover the feeling of indignation is intense on account of the verdict of the Visitors in the case of Professor Egbert C. Smyth, Brown Professor of Ecclesiastical History in the Theological Institution in Phillips Academy, Andover, and that strong expressions are used even by ladies, such as "dastardly," "persecution," "heresy hunters," "cowardice," etc. This feeling would seem to indicate that the creed of Andover, as stated by the founders of that institution, is pretty thoroughly outgrown, and that a mild form of heresy is rather necessary to the popularity of a preacher or professor, even in an orthodox community in New England; yet in this popular judgment there is, as usual, a lack of discrimination and exact justice. Complaints were made to the Visitors that Professor Smyth was teaching doctrines contrary to the creed of the institution and to the intent of its founders. According to the evidence presented it was clear, as the Visitors reported, that Professor Smyth had taught "That the

Bible is not 'the only perfect rule of faith and practice,' but is fallible and untrustworthy even in some of its religious teachings," and "That there is and will be probation after death for all men who do not decisively reject Christ during the earthly life."

The creed of Andover is written in language so clear as to be unmistakable, as is the will of the men who founded the institution, and it is difficult to see how a fair interpretation of its letter and spirit in connection with the admitted views and teachings of Professor Smyth could admit of any other decision than that rendered by the Visitors. The absurdity of the creed and the folly of the founders in prescribing it as a test of doctrinal soundness of all who should occupy chairs of instruction in the seminary are evident enough, and it is gratifying to know that now people generally have the intelligence and liberality to see this; but the fact remains that the verdict from an ethical point of view is correct, and that Professor Smyth, in subscribing to the creed and coming under obligations as a professor to teach nothing contrary to it, and then identifying himself with the more advanced theology by presenting the views of those who hold that the Bible is imperfect in some of its teachings and that probation extends beyond death, occupies a position that is inconsistent and morally indefensible. We cannot, therefore, join in the indiscriminate praise of Professor Smyth, and in condemnation of the verdict against him, however much he, in his theological views, is in advance of those who incorporated theirs as a test and qualification in the Andover creed. The case seems to us clearly one in which was involved fidelity to a trust, and whatever be the decision of the civil court to which an appeal is to be made, we do not see that the facts and the evidence left the Visitors any alternative.

PUBLIC OPINION.

Public opinion is "collective mediocrity." It finds expression in manners, habits, usages, laws and literatures, which react upon it and tend to give it comparative fixedness in its elementary characteristics, in spite of its proverbial fickleness. This complex body of thought, like an organism in which many parts coalesce and become co-ordinated in one structure, although subject to modification in the later accretions, becomes like "the cake of custom" hardened with age. It is not strange, therefore, that in some of the older countries, like China, it is hardly possible for the reformer to make so much as a dent in public opinion, in favor of the removal of barriers to progress and the introduction of the ideas and methods of a more advanced and progressive civilization.

Even in the most enlightened communities to day, public opinion is the most powerful influence constantly exerted against intellectual development and moral and social progress. It prevents free and impartial discussion

of unpopular views, and intimidates into silence and conformity with prevailing beliefs and observances the great majority of those who hold these views; thus directly discouraging independence, sincerity and consistency of thought and speech, if not indeed making these qualities the exception among those who hold decidedly unpopular views, and silence or acquiescence and a temporizing course the general rule.

All original thought must come from individuals. All great moral and social reforms must receive their first impulse from the few and not from the many. Nothing, therefore, is more imperatively demanded in the interests of progress, than the freest and fullest expression of those opinions which clash with the orthodoxy and conservatism of the day, as a counterpoise to the tendency of an arbitrary and despotic public opinion to make all think alike, and thus to produce "intellectual peace at the price of intellectual death." It is not simply the right, it is the duty of those in advance of their fellow-men to speak their honest thought, and in a way to be understood. Loyalty to conviction and courageous devotion to the highest conceptions of truth, regardless of public opinion or personal interests, is a demand of the times, both in public and private life. There is a vast amount of truth not likely to be popularly received for a long time and they who defend it in spite of the pressure of public opinion, perform a service the value of which cannot be overestimated.

A state of things, as John Stuart Mill observes, in which a large portion of "the most active and inquiring intellects find it advisable to keep the general principles and grounds of their convictions within their own breasts, and attempt, in what they address to the public, to fit as much as they can of their own conclusions to premises which they have internally renounced, cannot send forth the open, fearless characters and logical, consistent intellects who once adorned the thinking world. The sort of men who can be looked for under it are either mere conformers to commonplace or time-servers for truth, whose arguments on all great subjects are meant for their hearers, and are not those which have convinced themselves. Those who avoid this alternative do so by narrowing their thoughts and interests to things which can be spoken of without venturing within the region of principles; that is, to small practical matters which would come right of themselves, if but the minds of mankind were strengthened and enlarged, and which will never be effectually made right until then. While that which would strengthen and enlarge men's minds, free and daring speculation on the highest subjects, is abandoned."

HYPNOTISM.

The study of hypnotism in Paris, by Prof. Charcot and his *chef de clinique*, M. Babinski, is throwing

much light upon mesmeric phenomena. A rigid scientific investigation is being made and facts are being brought to light that show how vast the field for research is and how many medical and social problems the study raises. The possibility of one individual acquiring unlimited control over another so as to be able to impose his will upon him and make him do whatever he wishes has long been claimed; if this can be proved modifications of individual responsibility will necessarily follow. That it can be proved experiments now being performed at the Salpetriere hospital before a committee appointed by the government would seem to indicate. One of the modes of experimentation is as follows: A female patient, Mlle. A., is forced into the lethargic sleep by pressure on a suggested hypnotic point, when by a slight friction on the forehead she passes into the somnambulistic state. Dr. Babinski then approaches and tells her that she must make her will in his favor, and at once. She demurs at first, saying that she is too young to die, etc. This lasts a short time during which she goes on to say that she desires to leave her property to her mother and other relations, but after continuous persuasion and keeping up the suggestion that it is best to give everything to Dr. Babinski, she at last begins to weaken and finally agrees to the proposition, enumerating her possessions, which consist of about thirty francs and some few articles of jewelry. The next Thursday is appointed for the signing of the will. Dr. Babinski then cautions her to say nothing about it in the meantime, and if asked, to say that she acted of her own free will. She is then awakened. When the appointed day arrives it is noticed that she is rather nervous, and says that she has something to do but cannot recollect what it is. On being hypnotised, however, she remembers her promise, and when one of the bystanders is introduced as a lawyer she immediately draws up her will in favor of the doctor, asserting at the same time that she is acting with complete freedom, that she knows she has a poor family but prefers to give everything to Dr. Babinski. When awakened she repeats the same story. In commenting upon the study of hypnotism, *L'Univers*, a Parisian religious journal denounces the new science as "dangerous to morality." Professor Charcot has by the aid of instantaneous photography been enabled in experimenting with the patients to reproduce those peculiar facial expressions which are found in certain ancient works of art portraying the lives of saints and others who were supposed to be "possessed," showing that these pictures were copies from nature of hysterical men and women. Miraculous illumination is thus explained,—hence the wrath of *L'Univers* against Professor Charcot.

CO-OPERATIVE CONGRESS IN ENGLAND.

The Co-operative News (Manchester, Eng.) of June 11th, gives an interesting report of the Co-operative Congress held at Carlisle, Eng., the preceding week. Sir Wilfred Lawson presided and Geo. Jacob Holyoake made the leading address. At the opening of his speech Mr. Holyoake said:

"It was in the year when Her Majesty's reign began that I first became a speaker on co-operative subjects; so that this year, in which you accord me the distinction of being your president, is also the half-century terminus of whatever service I have been able to render the cause of industrial association."

We are sorry that our limited space, which in the press of original matter precludes lengthy quotations, prevents our culling tempting passages from Mr. Holyoake's able speech, which met with "unbounded applause" from those who heard it, and can only make place for his definition of what co-operation really is. "Future historians of this century," declares Mr. Holyoake, "will find it difficult to name any social feature of the great Victorian reign more original, more English, or more beneficent, than this of co-operation, whose inspiration is self-dependence—whose method is economy—whose principle is equity," which "is not an emotional contrivance for enabling others to escape the responsibility of making exertions on their own behalf, but a manly device for giving honest men an equitable opportunity of helping themselves. * * * In these days of State socialism it is not the interest of statesmen, or of any who influence public affairs, to discourage the increase of co-operators, who preach no doctrine of industrial despair—who do not hang on the skirts of the State—who envy no class—who counsel no war on property—who do not believe in murder as a mode of progress—as many do in well-to-do and educated circles, as well as among the ignorant and miserable. Co-operators are of a different order of thinkers. They believe that in a free country justice can be won by reason, if the agitators will make but half the sacrifice of time, comfort, money, liberty and life, which have to be made by those who seek social change by civil war. Aid to those striving to help themselves, but unable to make way, may be gracefully given and honorably received; but the ambition of co-operators is to reach that condition in which they shall be under no obligation to charity, to philanthropy, to patronage, to the capitalist or the State, nor need the dubious aid of revolution. Their ambition is not to be taken care of by the rich, but to command the means of taking care of themselves. The co-operator may not recast social life, but he may amend it. He does not profess to destroy competition, but to limit its mercilessness; and where co-operation is better, to substitute it for competition."

Among the delegates to the Congress from abroad

was Mrs. Imogene C. Fales, of New York City, who was "heard by the Congress with great admiration and well-deserved enthusiasm."

Dr. McGlynn declares that he believes in every doctrine of his Church and in the supremacy of the Pope in all spiritual matters. But he refused to recognize the authority of Rome on political or other temporal questions; and when the Pope tells him that he must stop advocating the theory that there can be no just ownership in land, and orders him to Rome, he refuses to obey. "I feel," he says, "that I can do my humble share toward bringing about so desirable a consummation rather by opposing and defying the unjust encroachments of the insatiate lust of the Roman machine for power than by submitting to such encroachments." Certainly, Dr. McGlynn has the courage of his convictions, and while we fail to see the practicability or the wisdom of the land theory which he defends, we admire the independent, manly spirit he has shown in adhering to his honest convictions. He will probably be excommunicated. Had he lived a few hundred years ago he would have been burned at the stake. It is not likely that Dr. McGlynn will continue long to retain confidence in the rightful authority of the Pope, even in spiritual matters. Such experiences as his are more powerful than any amount of reasoning to change the convictions of men in regard to religious doctrines and authorities. A little persecution or proscription sometimes serves as a stimulus to thought and enables men to realize the absurdity of claims never before questioned.

* * *

In the batch of Thackeray letters given in the July *Scribner*, he mentions in one a visit to an old school or college mate, a church of England clergyman. "I went to see that friend of my youth whom I used to think twenty years ago the most fascinating, accomplished, witty, and delightful of men. I found an old man in a room smelling of brandy and water, * * * quite the same man that I remember, only grown coarser and stale, somehow like a piece of goods that has been hanging up in a shop window. He has had fifteen years of a vulgar wife, much solitude, very much brandy and water, I should think, and a depressing profession, for what can be more depressing than a long course of hypocrisy to a man of no small sense of humor?"

"It was a painful meeting. We tried to talk unreservedly, and as I looked at his face I remembered the fellow I was so fond of. He asked me if I still consorted with my Cambridge men; and so I mentioned Kinglake and one Brookfield of whom I saw a good deal. He was surprised at this, as he heard Brookfield was so violent a Puseyite as to be just on the point of going to Rome. He can't walk, having paralysis in his

legs, but he preaches every Sunday, he says, being hoisted into his pulpit before service and waiting there while his curate reads down below.

"I think he has very likely repented: he spoke of his preaching seriously and without affectation: perhaps he has got to be sincere at last after a long dark lonely life."

* * *

The re-issuing of the famous *Vestiges of the Natural History of Creation* in Mr. Morley's universal library, makes one realize the enormous step that modern biology has taken. This work, it is hardly necessary to say, was published anonymously, but the authorship was afterward acknowledged by Robert Chambers. It is a popular statement of evolution fifteen years before the *Origin of Species*, and is sometimes spoken of as a very remarkable anticipation of Darwinism. But it failed to show any proof of a motive power, and does little to lessen the originality of Darwin's work. Chambers is very deeply concerned in showing that his views are not opposed to religion, and devotes much space in this cause. Yet this book was received with a storm of denunciation which it is difficult now to appreciate. This the author bore very philosophically; for, as he explained, his design in not putting his name to the book was "not only to be personally removed from all praise or censure which it might evoke, but to write no more on the subject."—*Science*.

* * *

A writer in the Boston *Herald* having claimed that every person should enjoy "individual freedom of action" as long as he does not "directly or personally affect the happiness of others," and that persons playing cricket on Sunday do not so affect the happiness of others, another writer in the *Beacon* of that city takes exception to this theory of personal liberty in an article which concludes with this sentence:

And when any person would go so far as to play cricket or any other game on Sunday, a day that is held sacred by the people of the highest morals, then it is that he does disregard the best feeling in a community, and therefore should be made to sacrifice his personal liberty, even though it does not "directly or personally affect the happiness of others."

* * *

It is unavoidable in times like these that men who substantially agree should dispute about terms, and that others who differ widely in their theoretical views should be in practical sympathy with one another; for many who have outgrown ancestral beliefs retain a reverent regard for the names and symbols of the past, while others who have been unable to cast aside speculative beliefs, the conditions of which came to them as a birth-right and the germs of which were planted in their minds in early youth, have, nevertheless, imbibed much of the liberal spirit of the age. We find men with no belief whatever in supernaturalism of any kind, who

yet insist on being classed with Christians in belief, and others who admit the truth of large portions of the Christian system, or who are largely influenced by its ecclesiastical methods and dominated by its doctrinal spirit, yet scornfully repudiate its name.

* * *

In George Macdonald's *David Elginbrod* is reproduced a Scotch epitaph which runs as follows:

Here lie I, Martin Elginbrod;
Hae mercy on my saul Lord God,
As I wad hae if I were God
And ye were Martin Elginbrod.

* * *

Sidewalk Stroller in the *Chicago Evening Journal* writes:

A long line of carriages was standing in front of a store on Madison street, and, as I was passing, a small black-and-tan pet dog ran out of the store. He held up one foot and looked bewildered for a moment, and then ran to the carriage at one end of the procession, and smelled the hoof of the right fore foot of one of the horses. He then went to the second carriage and smelled the hoof of the right fore foot of one of its horses. Then he took the next carriage, and then the next, until he had taken in the fifth carriage, when he nimbly jumped into it, curled himself up on the seat, and went to sleep. That was his way of finding out which was the carriage of his mistress, who soon afterward came out of the store, and get into the same carriage. The fact that the horse's hoof was made of horn, and that it had been plunged into all sorts of mire, all over the streets was nothing to him; that particular hoof smelled differently to him from any other horse's hoof in the world, and no other smell could be applied to it which would efface that peculiar smell.

Says the *Chicago Journal of Education*:

Why are the words of one writer read from generation to generation while another writer is forgotten soon after he is dead? The words they used are the same. Carlyle's sentences are often involved and inverted. His style is abrupt and sometimes execrable. The same may be said of some of Emerson's essays. Thousands of unremembered authors wrote in far purer language. Why will Carlyle and Emerson live? Thought is immortal. Nothing else is. Our bodies die. Nature decays. The world will in time become silent and dead, like the moon. We live by thinking, not by eating. Mind is the only evidence of life. We call it instinct that causes the mother to bend lovingly over the cradle of her child, or the bee to poison its victim behind the second cephalic ring, but it constitutes a complex intellectual operation, the psychological character of which is undeniable. Intelligence, instinct, reflex-action, these are the three terms of psychology, and between these forms of activity there is no barrier, no hiatus, no abyss.

* * *

To seek to change opinions by laws is worse than futile. It not only fails, but it causes a reaction which leaves the opinion stronger than ever. First alter the opinion, and then you may alter the law. * * * However pernicious any interest or any great body may be, beware of using force against it, unless the progress of knowledge has previously sapped it at its base and loosened its hold over the national mind. This has always been the error of the most ardent reformers, who in their eagerness to affect their purpose, let the political movement outstrip the intellectual one, and thus inverting the natural order, secure misery either to themselves or their descendants.—BUCKLE.

COPE'S THEOLOGY OF EVOLUTION.

BY DR. EDMUND MONTGOMERY.

Part IV.

Mind, coercing matter in this special case of vital organization, must evidently have a conscious idea of the organizing task to be performed, and must, moreover, be endowed with the power of actually performing it against physical necessity. The molecules, left to themselves, would fall into purely physical combinations; but consciousness is believed to interfere and to force them into different and designed arrangements. This favorite expedient is altogether illusive;—nothing but a glib and evasive answer to a pre-eminently positive question. Try for a moment to imagine preorganic consciousness—whatever that may be—directing the course of molecules, though wholly devoid of any organs or instruments to get hold of them; nay, having no possible means of even perceiving or consciously realizing their bare existence. It is impossible.

Our biology stands helpless in the presence of reproductive organization. It stands, however, more helpless still in the presence of productive organization. Let us see what anti-physical and anti-organic assumptions Professor Cope has to make, in order to secure the assistance of consciousness in productive evolution. Who can deny that we have experience of consciousness solely in connection with the living substance of organic individuals? To maintain that consciousness can exist in any way independently of such a matrix, is as bold an assertion as can well be made, requiring a strictly scientific justification.

Professor Cope ventures the assertion on the strength of the biological doctrine, that vital performances which are at first accompanied by consciousness, tend through frequent repetition to become more and more automatic, until at last the vital textures, whose functions they are, have undergone such definite organization as to be capable of performing them without conscious assistance. On the strength of this tenet, he concludes that the less organized or coherent the manifesting substance happens to be, the more consciousness will it have. He calls this strikingly original conception "the doctrine of the unspecialized." According to it he fancies that the constituent elements of the living substance or protoplasm are not firmly connected together by physical or chemical bonds, but remain in a state of loose independence. This "unspecialized" or "undecided" state he conceives to be a higher condition of matter than when it has fallen into physical and chemical combinations. "As soon as mechanical or chemical force appears in the molecules of the sustaining substance consciousness disappears." (*O. of E.*, p. 419.) The generalized outcome of this view leads, of course, to the conception that universal consciousness resides in "the lucid interspace of

world and world," as property of the wholly unspecialized interstellar ether, "the form of matter pervading all spaces whatever."

Professor Cope invites approbation to the following climax of his teaching: "Is it not probable that the grand sources of matter not yet specialized into the sixty odd substances known to us, may still sustain the primitive force not yet modified into its species, and that this combination of states may be the condition of persistent consciousness from which all lesser lights derive their brilliancy?" (*O. of E.*, p. 420.) We confess that the endeavor to derive all specialization from primordial and general uniformity and potentiality is highly tempting. But can we really believe that specialization into living forms represents a degradation in worth, when in fact, all the progress and excellence we recognize in this world is manifestly due to high-wrought organization? Surely, organic specialization does not mean seegregational differentiation from a pre-existent and all-containing totality. Its forms are not fragmented emanations, become particularized through specific deterioration. Organic specialization means, most certainly, gradual development of genuinely primitive life, by dint of a creative elaboration of the sundry vital functions and their underlying structures.

Professor Cope's astounding "doctrine of the unspecialized" rests entirely on the supposition that the consciousness of the organic individual resides in protoplasm, where "mechanical or chemical force" has not yet "appeared in the molecules." He obviously believes *morphologically* unorganized protoplasm to be also *molecularly* unorganized. And here lies his fundamental mistake. For, not only the gradual elaboration of protoplasm, from lowest to highest forms, out of material not derived from the unspecialized "matter pervading all spaces," but directly from matter subject to "mechanical or chemical force;"—not only this gradual chemical building up of higher protoplasm in the course of productive evolution; but, more strikingly still, the building up of definitely predetermined structures from the uniform protoplasm of reproductive germs, proves conclusively that the molecular constitution of protoplasm is rigorously determined or "decided." How could of two reproductive germs consisting both of uniform protoplasm, the one develop into a mouse, the other into an elephant, if this marvelously specialized difference were not strictly predetermined in the molecular constitution of the germs? The protoplasm of many infusoria is still in a very primitive state, quite fluent with the exception of the surface layer. You cut such an infusorium into several pieces and each piece will reconstruct the entire, definitely specialized individual. How could this possibly occur if the molecular constitution of the protoplasm forming the entire individual were not almost absolutely fixed? From a microscopic germ

of seemingly uniform protoplasm the wondrously specialized human organism is gradually developed. It is obvious that the reproductive germ itself must be here molecularly specialized in a supremely decided degree; for, are not the visible *morphological* specializations arising from its evolution, clearly the unfolded consequence of such *molecular* specializations? And, as regards the peculiar substance with which we know consciousness to be actually connected in higher organisms, chemical and biological facts render it all but certain that the higher that consciousness the more highly elaborated also the molecular structure manifesting it. This gradual elaboration of higher and higher organic substance, as a sustaining matrix of higher and higher life, is, indeed, the cardinal fact and essential import of evolution. And it is for this reason that we have been here so emphatically dwelling on it.*

We have really no evidence whatever that protoplasmic individuals of a primitive kind are at all conscious. On the contrary, it can be positively demonstrated that nutritive assimilation, and the protrusion and retraction of processes takes place solely by dint of the chemical and physical relations subsisting between the organism and its medium, and between different parts of its own protoplasm. Nor have we evidence of any description, allowing us to conclude that the reproductive germ of any sort of organism is in the slightest degree conscious. Still less, then, have we a right to conclude that consciousness is the influence which determines organization.

Professor Cope's fundamental assertion that "science proves that mind is the creator of organisms," has through sundry modes of consideration been shown to be untenable, and with it has given way his first and only "step in the evidence of the existence of a great mind." (*T. of E.*, 25.) The greatest practical difficulties, however, in the path of the mental origination of organic results have not yet been touched upon. These are: The initial entrance into existence of new organs; the organization of the "circulatory and digestive systems;" the purposive movements of the tendrils of plants, and those of carnivorous leaves that crush and digest insects; indeed, all protective and adaptive organization of complex vegetation.† Professor Cope thinks that "the answer to the question whether such organic

results originated in consciousness or unconsciousness, constitutes the key to the mysteries of evolution, and around it the battle of the evolutionists of the coming years will be fought." (*O. of E.*, p. 394.)

Of course we, who do not believe in the organizing power of consciousness as such, cannot look upon this question "of consciousness or unconsciousness" as the central point of contention in the evolutionary campaign. Nevertheless, we fully admit as a leading proposition—to be scientifically proved against mechanical biology—that *spontaneous* activities have played the greatest part in evolution, and that those special spontaneous activities, called volitional and emanating from nerve-centers, have conduced more than any other influence to realize the organic development of higher animals, especially the development of man; that, furthermore, the future evolution of the human race will be almost entirely dependent on the direction taken by such activities. Spontaneous activity subjugates and utilizes the mechanical nexus. The philosophical revolt against mechanical necessity will certainly receive its scientific justification.

No doubt the organic development, manifestly accompanying functional activity wherever it takes place, has to be regarded as the essential fact in productive evolution. And, though the scientific evidence for the transmission of acquired modifications and aptitudes is not yet abundant, still it is sufficient clearly to indicate that in that direction is to be sought the veritable spring of progressive development. Paleontological research demonstrates that productive evolution has actually taken place on our planet. And if we are not positively certain to what influences it was mainly due, we have at all events experience of various occurrences decidedly pointing toward functional activity as its proximate cause. It is, above all, the astonishing process of retrograde metamorphosis, distinctly traceable in parasitic organisms, which affords strong proof that organic structure can maintain itself only by dint of vital activity, and that the deteriorating results of functional inaction become *hereditary in the race*. This unmistakable and most striking experience renders it at least highly probable that, vice versa, the developmental results of functional activity have likewise become hereditary in the race. And, if the very existence of organic structure is thus dependent on functional activity, then all organic structure must have been developed by means of such activity. Indeed, it is not difficult to demonstrate that the living substance, even when constituting lowest forms of life, exists solely by means of a definite cycle of molecular activities, kept up through functional interaction with the medium.

Organic structure is the sensible manifestation or bodily expression of vital activity; a particular structure, the bodily expression of a particular vital activity; both, the structure and the activity by which it is formed and

*Organic substances are actually built up in the laboratory and out of it, by means of the synthetical process known as chemical substitution.

† We agree with Professor Cope that plants have most likely descended from free moving protoplasmic individuals. Indeed, the old Aristotelean view, that a plant is a reversed animal, is highly probable. It has become a parasite of the soil, much in the same way as a tapeworm is a parasite of the intestinal membrane, developing in many instances a vast number of somites or joints. Only plants have come to spread their recipient verdure wide and wider into the luminous air, lifting into life the crowning glory of their incense—shedding bloom, to solemnize in nuptial splendor the great mystic rites of procreation. Whoever has witnessed the protoplasm of plants slip out of its cellular envelope, move about for a while in amaboid fashion, become then sessile, and enclose itself again in a new envelope of its own making, can hardly avoid adopting the Aristotelean inference.

sustained, are the visible exhibition of one and the same indiscernible fact of nature. You may stimulate a vital structure to heightened activity, but you cannot altogether arrest the peculiar molecular process by which it is constituted without simultaneously suppressing its vitality.

When pathologists discover a hypertrophic heart they at once know that some impediment in the circulation has thrown an abnormal amount of work on the pumping muscle, through which increased function the excessive structural development was brought about. When they meet with a greatly enlarged, healthy kidney they are certain that the other kidney has in some way become useless. Surely, it would be an extravagant, unwarranted hypothesis to assume here that some kind of consciousness has been the influence which has directed the building up of those most specifically constituted organic structures. But the question of conscious direction starts into prominence as soon as it is some so-called voluntary exercise, that seems to give rise to structural development. When I deliberately set about to develop the muscles of my arm through voluntary activity, and the result aimed at actually follows, it has all the appearance as if it had been produced under the guidance of consciousness. Here we find ourselves face to face again with the supposition that mind is moving matter, a notion whose fallacy we have exposed in the first part of this examination.

Let us see whether we can catch a glimpse of the means which in reality conduce to determine this marvelous occurrence—the development, the creation of organic structure. A person setting out on a walking tour finds at the end of it that the muscles of his leg have been greatly developed—a result neither consciously aimed at nor anticipated. What can consciousness have contributed toward the result in this instance? It will, of course, be said that the walking at all events was done under the influence of consciousness. But mere artificial stimulation will answer the same purpose. Muscular structure can be kept up and developed by nothing but electric stimulation. Here, then, we become distinctly aware that the faculty of developing under activity is wholly inherent in the functioning structure. It is true the activity has to be stimulated, but any kind of stimulus will answer. Can consciousness be regarded as one of these? Does the mental state, called consciousness, itself originate somewhere in the brain, the special molecular motion which, propagated along the motor nerves, acts as a natural stimulus to the muscles? Such a mental origination of motion is wholly inconceivable.

When manual skill of a peculiar kind is acquired and becomes at last automatic, the principal change that has taken place consists evidently in a modification of nerve-structure, whose molecular constitution has become

thus specifically organized, enabling it in future to act or function at once in so definite a manner that its propagated commotion results in the peculiarly co-ordinated set of movements which make up the skillful performance. How has this been brought about? The unusual combination of movements has been effected by means of manual aptitudes already organized, with the further assistance of sight and touch. We are nowise directly aware of the structural modification which is occurring in the nerve-centers. It is unconsciously wrought by the constant reiteration of those particular muscular movements. They are its true inciting cause. For it is a fact, that muscular fibers and their central connections form one continuous organic texture. Nothing can happen in the peripheral parts without affecting the central parts.

We know, then, that consciousness organizes nerve-structure just as little as it organizes muscular structure. The faculty of becoming specifically organized under special modes of activity resides in nerve-structure in the same manner as it resides in muscular structure; and this amounts, in all verity, to a creative accession of specific energy. For it must obviously be regarded as a specific energy that a particular functional activity of nerve-structure can become thus automatically capable of definitely stimulating a certain simultaneous and successive set of muscular movements. We have, then, here an altogether hyper-mechanical faculty, belonging to what *we perceive* as the molecular constitution of the functioning structure. And the constituent elements of this structure are not placed into organic arrangement by any outside influence, whether conscious or unconscious. They are held together in their peculiar order by intrinsic forces; the entire vital arrangement and commotion possessing, moreover, the inscrutable and creative power of progressively developing under functional activity. This organic development may rightly be called *creative*, because it is not that something already existing has merely changed place and form, but that something has newly merged into being which did not exist before. This actual state of things constitutes a fundamental, anti-mechanical fact of nature, forming part of that vital spontaneity of which our world-mastering, world-transforming volition is an outcome.

The aid which sense-perception affords to organic development cannot be over-estimated; but the progressive organization to which it ministers takes place just as unconsciously as all other organization. Our so-called memory, which we build up through sensorial experience, is organically wrought by dint of processes occurring wholly beyond consciousness. Only our vital spontaneity enables us to place ourselves in such relations to our medium as will best conduce to our welfare. And we know, by means of pleasurable or painful

feelings, which of the manifold influences of the medium are affecting us beneficially and which harmfully.

Beside, our race, through ages upon ages of vital toil with its cumulative organic results, and through traditional experience artificially secured, has acquired the power not merely of benefiting by the best conditions naturally offered in the medium, but of actually transforming the medium itself, so that it may better subserve its human purpose.

In this sense we assent to Professor Cope's dictum, that "Intelligent choice may be regarded as the originator of the fittest, while natural selection is the tribunal to which all the results of accelerated growth are submitted."

THE GOSPEL VILLAGE.

BY ONE WHO SOJOURNED THERE.

"Of course they won't convert you," said the old stage-driver, as he drove me up among the mountains, which I had private reasons for exploring thoroughly. "Your head's level. But they'll do their best to make you comfortable; and you can't help liking 'em. I've known 'em, and known all about 'em, for more'n two years, and I know they never speak an unkind word to anybody, nor about anybody, nor find fault with anything, not even the weather. I used to growl a little, when I first drove over there, about the dust, and so on, but they never joined in; and when I got familiar enough to ask why they didn't, they said it is God that makes the weather. I s'pose He does here in Southern California, if He does anywheres. Well, it beats all how they feed and clothe the tramps and cranks. If they weren't so hard up themselves, the village would keep chock full of free boarders. But they can't stand such poor living a great while; and then, you see, I'm a Justice, and I clear out the worst of 'em as fast as I can. There's an Elder that's been hanging 'round these six weeks, trying to make 'em pay him for preaching to 'em, when he knows its against their principles to. I've been kind of hankering after his company back with me, and I guess I'll get it this trip. You see, as I watered the horses in what we call Brandyville, I heard that their Elder had gone off mighty sudden, and it would be just the place for the man I'm after. Guess he'll call it a providence; and may be it is; though it's rough on Brandyville."

His talk ran on until we rattled down, through pastures full of sheep, vineyards in bearing, and rich fields of grain, to the great grove of apple, orange and walnut trees, amid which stood an old monastery, with several cottages that evidently had been but lately built. In the broad veranda sat the Elder, a fat, jolly looking fellow, even younger than I. He was delighted to hear of the opening in Brandyville, and at once began to tell us a string of what he called good stories, which he said the villagers were too old-fashioned to appreciate. The old stage-driver listened with a broad grin, but suddenly stopped the flow of jokes about the Bible, in order to give more particulars about the vacant pulpit. As he did so, he nudged me, and I saw in the room within a tall, slender girl, moving to and fro with a look of disgust and pain on her sweet, pale face. There beamed only peace and charity from her large, dark eyes, however, when she came out to welcome me to her home. There Martha dwelt with her meek, yet steadfast father, whom I soon learned to call Uncle Joshua, her blithesome little sister, Mary, her old aunt, and her cousin Ben, a young man who was like her in that he said almost nothing. His eyes seemed, however, to see all that went on around him; while there was such a dreamy look in hers, as made me at first wonder at the neatness of the house, and the excellence of the dinner, though this con-

sisted mainly of food which I had brought, at the stage-driver's suggestion. As he and Ben were harnessing the horses, and the young preacher was waiting for the stage, Uncle Joshua said: "My brother, you have done what you could for us, and we have tried to do for you, according to our means and our principles. I thank you, and bless you in the name of the Lord Jesus. And now, I beseech you, as I have done already, tell us, for His sake, if there is anything in our principles and purposes, that is contrary to His words. We are weak and ignorant, but we try to follow Christ. If there is any better way than this tell us plainly."

"Oh, well," said the minister, with a smile, "the main trouble, in my opinion, is that you are making unnecessarily hard work of it."

"But when Jesus was asked, 'Lord, are there few that be saved?' He said unto them, 'Strive to enter in at the straight gate; for many, I say unto you, will seek to enter in, and shall not be able.' And you know we have two parables to teach us the same truth: 'Many be called, but few chosen.'"

"Dear me, I have been trying to make you see that all this was only a prophesy that the Jewish nation would be punished for crucifying Him, by losing the honor of being the chosen people."

"I know, brother, you have taken a great deal of trouble with us, and I have been studying the Gospels very carefully while you have sojourned here, trying to see which of us is right. It looks to me as if He did not speak for that day only, but for all the ages. Matthew, Mark and Luke all tell us that He said, 'Heaven and earth shall pass away, but My words shall not pass away.' And His last words to the Apostles, according to Matthew, were these: 'Go ye, therefore, and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost, teaching them to observe all things whatsoever I have commanded you; and lo! I am with you alway, even unto the end of the world. Amen.'"

"Amen," murmured the sweet voice of Martha.

"But you don't surely think," said the minister, "that we are commanded to raise the dead, and take up rattlesnakes, and heal the sick by laying hands on them, as the Apostles were, do you?"

"I think that if we had more of their faith we should have more of their power; and I know that Jesus was speaking to great multitudes when He said, 'If any man come to me, and hate not his father, and mother, and wife, and children, and brethren, and sisters,—yea, and his own life, also,—he cannot be My disciple. And whosoever he be of you that forsaketh not all that he hath, he cannot be My disciple.'"

"But even you do not keep these precepts literally. You don't want Miss Martha, here, to hate you, and you have not yet given up all you have, though you seem likely to. Don't you see you've got to use common sense in interpreting Scripture; you've no right to say that Jesus taught what isn't rational."

"But, brother, even His friends thought Him mad. The Bible says nothing about 'common sense;' but it does say 'It is not in man that walketh to direct His steps.' 'Trust in the Lord with all thy heart, and lean not unto thine own understanding.' Who am I that I should set my own mind above that of Christ, and seek to explain His words away? You know yourself that we are trying to use our property even as the first disciples did theirs. And it would be better for Martha to hate me, and all men else, even him whom she might love most tenderly, rather than let anyone come between her and Christ."

"But I am sure you would do him better service if you would live more like other Christians. You're not going to convert many people if you begin by making yourselves unpopular."

"You agree with me that California is not so religious a nation as Judea; but Jesus said: 'Woe unto you when all men

shall speak well of you; for so did their fathers to the false prophets.' 'That which is highly esteemed with men is abomination in the sight of God.' He told His disciples that the world would hate them as it hated Him. He looked forward even to this day, as he said in sorrow: 'When the Son of Man cometh, shall He find faith on the earth?' The time has come, brother, for you to leave us. We shall see your face no more. Let me beseech you to remember how Paul and James and the beloved disciple bid us not to be conformed to the world, but to keep ourselves unspotted from it, for 'The whole world lieth in wickedness,' and 'Whosoever, therefore, will be a friend of the world is the enemy of God.'

The minister retreated so badly routed that I took care not to argue with Uncle Joshua, though I found that the children were taught nothing but writing and a little oral arithmetic, besides reading the Bible, and that no book but this was ever read, nor any newspaper, except those sent with notices of funerals. What else could be expected of men who delighted to talk of Jesus "having never learned," of God having "made foolish the wisdom of this world," of knowledge vanishing away, and of "avoiding oppositions of science, falsely so-called." They imitated Wesley in interpreting such texts as, "Woe unto you that laugh;" "Bodily exercise profiteth little;" "Is any merry? let him sing psalms;" etc., so strictly that there was no play, even for little children.

They owned all their property in common. The women kept themselves in complete subjection to their fathers and husbands, and took little "thought for raiment" or "outward adorning;" but no neglect could destroy Martha's loveliness. I remember much more of her aspiring face in meeting, which of course was held on Saturday, than of Joshua's sermons. I remember, though, that he justified their practice of trusting not to physicians, but to "the prayer of faith," by the unusually good health in the village, and also that, while showing sincere gratitude to God for having brought them to a place where they did not need to take thought for the morrow, or lay up any riches, he predicted that the whole earth would come into the same condition as fast as men really began to live according to the Sermon on the Mount.

No one could have followed it more faithfully. Even when a naughty boy who had strolled into the village was wantonly picking, and throwing away after a single bite, the peaches not yet ripe enough for market, Joshua would do no more than remonstrate gently, and quote text after text. I took up my gun in order to frighten him, but Martha stepped between, saying, "Resist not evil!" Fortunately my spy-glass answered just as well, for he had no sooner seen me level it, than he jumped down and ran off, telling a companion who was waiting for him: "It's no use foolin' with them things."

I had spent a month apparently in hunting and fishing, at first near the village and then in long excursions through the mountains, before I picked out the place for sinking the mine that has made me rich. As a guide, I had Ben, whom I got very fond of, especially after he killed a big rattler I was about to jump on.

He had a curious way of asking questions when we were alone together, sometimes about politics, then about the laws governing the sale of real estate, then about the genuineness of the Gospels, and then in turn about the success of communistic settlements.

I kept as far as I could from saying what I knew Joshua and Martha would not wish him to hear; but at last he told me just as I was about to leave for San Francisco, that all his inquiries had the same object. His uncle and mother and the other settlers had put all their property into starting the village, but had only paid one quarter of the price of the real estate. The

next payment would be due in a few weeks, and there was no chance of meeting it. The owners, among whom was the stage-driver, might allow them more time, but would certainly not give up their claim entirely. His uncle and cousin were willing to submit to what they called the will of God. But he did not feel sure that Jesus had commanded such a way of living, and even if he did, the fact that he and the apostles were entirely wrong about politics showed that they were not likely to have known much about business either. The Gospel plan of having all things in common, and taking no thought for the morrow, had always proved a failure. In their village those who were not too old or feeble to work hard lacked motive to do so. He did not work himself as he could anywhere else, for he could see no gain to those he loved best from his labor. His mother thought as he did, and his uncle had finally consented to his going away if I would take him with me. This, of course, I was glad to do. He is now superintendent at the mine, and has married his cousin Mary.

With his help I kept watch over the community until the time drew near on which it was broken up. One day I found Martha weeping bitterly and even more distressed about her father's and sister's prospects than her own. I told her of the new home, ready for us all to live in together, and she at once consented, saying that she would rather serve me than anyone else. But when I begged her to be my wife, she shrank back and said she could not let even me come between her and Christ. I promised again and again that I would never turn her away from the path she had chosen, but would do my best to make it easy to her feet. I assured her that I loved her all the more because she walked so high above the world, and lived such a perfectly Christ-like life.

"Alas," she moaned, "you call it Christ-like; but you will not follow it. Even while you sojourned here, you were serving Mammon. You will keep on doing so; and I could not marry you without becoming a helpmeet for you. The wife must be subject to the husband."

"No, no! I don't wish that. I believe that every woman should be free to choose her own path to heaven, and you more than all the rest."

"Woe unto us both! I see it all plainly. You do not believe in Christ! If you did, you would try to give up the world; and you would not offer me any more freedom than is appointed in the Word of God. And oh! Oh! You remember what Jesus said is to become of all who believe not on him! Are we to love each other, only to be separated forever?"

"You may make me a Christian, Martha. I wish I were more like you."

"But I am very weak and ignorant. If I marry you, your thoughts will be my thoughts, and your ways my ways. It is better that you marry some one wise and strong enough to show you your path to heaven. We shall meet there where they neither marry, nor are given in marriage. Till then we must part. It is for such as me that Paul wrote: 'Be ye not unequally yoked together with unbelievers.' At last my cross is laid upon me! Leave me alone with Christ, I beseech you, until his yoke grows easier for me to bear!"

She burst into tears, and broke away from me. Before I could see her again I was telegraphed for from New York. I left money with her aunt, to get the whole family to where Ben was waiting for them. I wrote letter after letter to her and her father; but had no answer. I was detained longer than I expected to be, and had almost made up my mind to leave the business unfinished, when I happened to see this heading in a Sunday paper: "TOO CHRISTIAN BY HALF! PRAYER CURE VERSUS SMALL-POX!" Joshua had taken in a sick tramp and called no physician. Among the dead was Martha.

CORRESPONDENCE.

MIND-READING, ETC., AGAIN—A CORRECTION.

To the Editors:

Your issue of June 9th contains an article by J. S. Ellis. It purports to be a criticism of mine which appeared in your paper of the 28th of April. Had Mr. Ellis only made an attack on me I should not have broken into my vacation time by taking the trouble to reply. But so extraordinary are its misrepresentations that I cannot let them pass. Some casual reader, or some one who did not read my article at all, may get the impression from Mr. Ellis that I really hold the astonishing positions which he attributes to me.

He says that my article is a "characteristic one." I am not familiar with his writing; but if this is "characteristic" of him, then he alone, is abundant justification for my first article. Instead of sitting in scientific judgment on me, he needs to learn the very first principles of the "scientific method"—the chief of which is the calm observation and record of a few facts to start with. For most of the statements he makes about the positions I took in my article are simply *untrue*. I proceed to give a few specimens:

1. He says I "demand that investigators should be believers." This is even ludicrously false. Why does he suppose I care to have people investigate who are already believers? I merely pointed out the absurdity of a person's investigating a thing when he is *thoroughly convinced beforehand* that it is all humbug. I only said that this—a somewhat common—state of mind was hardly the proper one for a scientific investigator.

2. He makes me say that "the non-acceptance of these alleged facts by scientists is a scandal both to science and philosophy." I said *nothing of the kind*. I said that, since there is such a body of alleged fact, and since it has been in existence so many years, and since so many otherwise intelligent people are believers, it is a scandal that there should be no scientific investigations worthy the name. The man who can think those two statements identical I cannot regard as a good illustration of the scientific state of mind.

3. He puts me in the position of saying, that "when once a man has persuaded himself that his particular nostrum is the truth, he will receive and promulgate any number of 'cases' supporting it that may be reported without any particular inquiry into their reality." This is just about as near to what I said as a caricature in *Punch* is like a photograph of Mr. Gladstone. What I *did* say is simple common sense. A man who is familiar with the fact of gravity does not need to go into an elaborate examination of the statement of his small boy that, having flung a stone into the air on a particular day, it fell back to the earth again.

I have no means of verifying the statements as to thought-transference that have been published by the English Society. But I quite fail to see the manifest absurdity of my inclining to the opinion that they *may be* true, on the ground of my personal acquaintance with similar things.

And if—as is true—it was *not* my purpose to publish these facts at present, I hardly see what right Mr. Ellis has to demand that I either give up my personal property—these facts—or else hold my peace.

Why, then, did I write the article at all? I wrote it at the request of the editor of this paper. And my purpose—as any "scientific" observer ought to have seen—was not at all to *prove* the truth of mind-reading, or anything else. It was only to commend the subject as worthy of scientific attention, and to suggest some criticisms as to the *temper* in which the investigation ought to be carried on. And Mr. Ellis promises to render me valuable aid in my work; for the temper he shows is a first-class specimen of "how not to do it."

4. Mr. Ellis, again, charges me with wanting some "sort of

rubbish" admitted into scientific theories. This, also, is simply false. I asked nobody to admit anything into any scientific theory.

This is enough to illustrate the competence of my critic (?) to see and state facts, even concerning plain statements made by the writer of a newspaper article.

As my chief purpose, at this time, is to correct these gross misrepresentations, I will make short work of what I wish further to say. Mr. Ellis thinks it "characteristic" of me to hold the opinion "that there are proven facts which are denied admittance into scientific theories." I am glad if it is characteristic of me to be sensible enough to hold such an opinion. How does the world's knowledge grow except by the discovery of *new facts*? And of course there is *always* a time, after these new facts are discovered, before they are admitted "into scientific theories." How about evolution itself only a few years ago. So this wonder that is characteristic of me, turns out to be only a very commonplace piece of common sense after all.

Only one point more will I make. Mr. Ellis seems to think that nothing can be demonstrated to be a fact unless it can be dealt with as a chemist deals with a salt in his laboratory. I believe that nothing can be demonstrated except by the scientific method. But this one method, in the hands of a sensible man, will take account of the *kind* of supposed fact and the *conditions*. Suppose, for example, that a scientist stoops low enough to consent to investigate the preposterous and barbaric superstition that a man is something besides dirt, and that there is something in him that continues to live after the death of the body. There are, even in this nineteenth century, certain curious people who at least *hope* that this may be true. There are even some who claim that they have received communications from their "dead" friends. Now suppose, I say, that a scientist should turn aside from the more important question of bugs and skeletons to investigate these absurd claims. Now, of course, if a man consents to *investigate* a thing he, by that fact, admits that there is *something to investigate*. And, if he is a rational man, he considers the *nature* of the supposed fact to be investigated. Does he expect to catch a "spirit" and cage him in his laboratory till he gets through with him? Every sensible man knows that the *mental* or nervous condition of even a hypnotic subject may make or mar all experiments. And these the "operator" may be entirely unable to control, as he can easily control his "salt." And all this is a thousand times more true in dealing with what is called a "medium."

It is just this sort of nonsense, of testing these things in the *same way* as one would conduct a purely physical experiment, that I had in mind in my first article. But the "scientific method" must always be adhered to—the method of getting facts first, being sure of them—and then trying to see what they mean afterward. But *if* it should ever happen that one *were* dealing with an invisible intelligence of any kind, it is palpably absurd to talk of treating *such* a fact as if it were a "salt," or of being able always to repeat the same experiment and get the same results at will. This supposed invisible intelligence *may* have a will of his own, and so object to being "ordered around" at the caprice of the experimenter.

I express no belief in these things. I only say that, *if* such claims as these are ever to be investigated, these suggestions and such as these have got to be taken into account. To defy all the common sense of the supposed conditions and facts and then to speak of it as investigation at all, is manifestly a farce.

Now, any one who jumps to the conclusion that I am a spiritualist because I say these things, will manifest the same unscientific temper that Mr. Ellis has already done. I only claim that *if* spiritualism is to be investigated at all, it should be investigated in the light of its own claims and not according to methods which,

while appropriate enough to "salts," are absurd as applied to its asserted facts.

M. J. SAVAGE.

THE ENGLISH GOVERNMENT OF IRELAND.

To the Editors:

OTTAWA, CAN., May 19, 1888.

It is somewhat surprising to see the unanimity with which American newspaper and other writers condemn the English government of Ireland. We do not wonder at this on the part of the political press, because the necessity of catching the Irish vote is sufficient to account for it. But we should expect to see a disposition calmly to investigate the facts displayed by those who do not write for the purpose of conciliating the Irish. It is sometimes difficult to balance the conflicting statements on either side. Still, there are rational probabilities which should make people pause before they condemn the English government on all Irish charges. The fact that Parliament is evidently so anxious to do justice to Ireland that it has, during the last twenty years, passed so many acts for that purpose, putting the Irish tenant in a much better position than his fellow subjects in England and Scotland, that an altogether disproportionate amount of its time and attention has been given for many years to Irish affairs; these considerations form a strong presumption that there is something wrong in the wholesale condemnation of the American press.

The most absurd tirade on English government in Ireland that I have yet seen, appears in the last number of THE OPEN COURT, written by an otherwise very sensible woman—Mrs. Stanton. She seems to have been reading some of the sham histories of Ireland, written by Irishmen, which bear about the same relation to facts as the mythical histories of ancient Greece and Rome. It seems that "Down to the sixteenth century Ireland, in her system of education and jurisprudence, was pre-eminently the great center of progress and learning. To her free schools and universities came students from every part of Christendom, and Irish teachers and professors spread throughout the known world." We are told the still more astounding fact that "The body of her laws, revised and codified, is now, by order of the British government, being translated [out of the original Gaelic, I suppose] and published as a rare and valuable treasury of ancient jurisprudence, Parliament making an annual grant for that purpose since 1852." This must be news to British statesmen. An annual grant for thirty-five years to translate and publish the jurisprudence of the times of Brian Boru! "But alas!" Mrs. Stanton adds, "all this glory has departed. All the solemn treaties made by England when Ireland consented to a union [the union took place in 1800] have one after another been violated; her manufactures, by direct legislation, have been ruthlessly destroyed, the education of her children made a penal offense [what would Archbishop Whately, the author of Irish National Education, have thought of this?], her lands confiscated, her troops disbanded." And so on, through a column of senseless abuse of England, of which it is unnecessary to take any notice.

Every candid person in the United States must be struck by the contrast between the North and the other three divisions of Ireland; the one distinguished by content and prosperity as much as the others by discontent and poverty. So far from Irish manufactures being ruthlessly destroyed by English legislation, we see Belfast a flourishing manufacturing center, having grown from a town of a few thousands of inhabitants, at the time of the union, to a large city of 220,000. All the industries which distinguish the neighboring city of Glasgow, even to the building of iron steamships, are here carried on. With the exception of Catholic disabilities, which lasted twenty-nine years after the union, but which were abolished sixty years ago, the Irish people are on a perfect footing of equality with each other, North and South, as well as with their fellow-subjects in England and Scotland. There is perfect freedom of trade between them. Every

measure of improvement in legislation has been extended to Ireland. Every extension of the suffrage—down to the latest one, under Mr. Gladstone's government, which doubled the numbers of the Parnellite party in the House of Commons—has been in common to the three kingdoms.

If it be said that the inhabitants of the North of Ireland are of a different race from the rest of the island, that they are the descendants of colonists from the dominant race in England and Scotland, we may compare the aboriginal Irish with the inhabitants of Wales, who are of the same Celtic stock. The Welsh, while protesting loudly against the Established Church, in which few of them believe, are nevertheless prosperous and contented. They also were conquered by the Saxon. But they do not shoot their landlords; they do not refuse to pay their rents, and boycott and murder those who do.

This leads us to the true cause of all the miseries of Ireland. When the Reformation took place in England, the Welsh joined with it at once. Like the Scotch people, they became and have remained more Protestant than the English. The majority of them are strongly Methodist. The Irish, unhappily, clung tenaciously to the old religion. The Church of Rome, since the days of the Spanish Armada, has been the persistent enemy of England, as she is to this day the enemy of every free people. She has made the most of the adhesion of the Irish people. To multiply the numbers of the faithful, she long encouraged early and improvident marriages, till the population outran the resources of the land. Forty years ago, a population of eight millions of potato-fed people broke down under stress of famine and perished in thousands, while no such calamity overtook any other part of the British islands. The Church has opposed the education of the masses in Ireland, and has done everything in its power to thwart the excellent system of national education established chiefly by the influence of Archbishop Whately.

The first effect of home rule would be that the clergy would get complete control of education, and everybody who knows anything about education in the Province of Quebec knows what that means. Nevertheless, many thoughtful persons in America say that the Irish ought to have home rule; that they ought to have a Parliament of their own to manage local affairs, and advice flows in from all quarters in the United States and Canada to the British people to abandon their system of legislative union and adopt a federal system in its stead. But a legislative union has many points in its favor, and the nation will be slow to change it till they have better proof than they have yet had of the success of the federal system on the other side of the Atlantic.

J. G. W.

IS MEMORY NECESSARY TO CONSCIOUS MENTAL LIFE?

To the Editors:

MORRIS PLAINS, N. J.

Mr. Daniel G. Thompson, in his interesting article on "Personal Immortality," in THE OPEN COURT, says that *memory is everywhere* necessary to conscious mental life, because we can only recognize an experience by reference to former experience (in other words, by comparison), and upon this, if I understand him rightly, he bases his hope of immortality, and at once recognizes the weakness of the position in the fact that memory is apparently dependent upon bodily conditions.

Of course, if the continuance of conscious life *is* dependent on memory, the logical result must be that immortality can only exist when memory is retained, but—is not memory, as he understands it, rather a quality of the mind than of the soul, and as such, necessarily dependent upon the existence of the body and a clog—rather than an agent—of immortality?

Surely, we are *conscious* of mental life, quite independently of any comparison or memory. The fact that we know, that we think, implies the existence of something of which we think, and

If comparison were necessary to that experience, we should have to conceive it possible to *not* think, which is unthinkable. We think—therefore there is an object of thought; therefore that object existed before our thought conceived it, and must always have existed, or we could not conceive it as having done so. Would it not seem that we must seek the best argument for immortality in the existence of that of which we think, rather than in the fact that we think of it, and in so doing compare it with former experience? The mind conceives—yes—but it is the existence of that of which the mind conceives, not the fact of the conception, which suggests the immortal. Of course, immortality is past as well as future. It cannot be otherwise. Mr. Thompson says: What once *was*, is; but it is necessarily equally true that what *is*, *was*. May not memory or comparison be the *echo*, as it were, of immortality rather than, in any sense, its proof?

Again, Mr. Thompson says: Disintegration or dissolution of the body is merely disappearance, and we are bound to consider reappearance possible under appropriate conditions; but can it be said of the soul, or immortal part, that it *ever* has appeared, or ever disappeared? The body, we know, returns to the native elements; but of that which animated it what do we know? We cannot certainly affirm of it that it is disintegrated; it may have been a simple principle!

If immortality *can* be scientifically demonstrated, it must be, it would seem, by seeking for the proof in an experience which is as universal as death itself. Do we not find this universal experience in the fact that an object of thought must exist before thought itself? must always have existed? must continue to exist, independently of that which thinks it?

And as man's thought embraces the eternal, does it not, in embracing it, become eternal also? For that which existed before his thought was, *is*, and must always be. Memory, as we conceive it, is but one of the myriad manifestations of the possibility of thought, as thought, and *may* be the perishable or mortal part of that which is imperishable and immortal. If this be so, the death of the body will be but one experience in the existence of the eternal *soul* or *thought*; one link in an endless chain of being. This solution of the problem, if permissible, would at once make immortality *individual* (if not personal) as the necessary result of individual experience. It would almost seem as if, in such a connection, *individual thought experience*, through the medium of the body, would alone make what we mean by *personal* immortality possible, and then *only* as contingent to, and not as an absolute necessity of, *individual eternal life*. That which is *personal* may die, if not with the body, later; but that which is individual, as the experience of thought, embracing an object necessarily eternal, cannot die, but must be as eternal as the object it can conceive, otherwise it could not conceive it.

I am so fully aware of my ignorance of philosophy that I can only beg Mr. Thompson's indulgence for these remarks, in consideration of my very deep interest in the subject of his paper. Unfortunately, it is this ignorance which makes it so difficult for most of us women to follow the hopeful views of scientific philosophy and, when "faith" is no longer possible, leaves us in that quagmire of doubt which is our dismal nineteenth century inheritance.

Yours truly,

JANET E. RUTZ-REES.

BOOK REVIEWS.

ELEMENTS OF BOTANY. By *Edson S. Bastin*, A. M., F. R. M. S. Professor of Botany, *Materia Medica* and Microscopy in the Chicago College of Pharmacy. G. T. Engelhard & Co., Publishers: Chicago, 1887.

There is not much room for originality in the make up of a

botanical work, but Professor Bastin has written a valuable treatise that no cyclopedia or library could equal in the special information afforded. As he says in his preface: "A botany is needed for high schools, academies and colleges of pharmacy and medicine; there are works which are admirably adapted to students of mature and scientifically trained minds, and there are others which are quite well suited to the needs of young beginners. Too many text books on scientific studies are written for the few whose exceptional taste for science makes them willing to encounter unusual difficulties, but such text books are ill suited for general use, and often create a distaste for what they are intended to encourage." Professor Bastin lays stress upon the order of presenting a subject, as what is best for the average student is not equally suited to the well-disciplined mind, "*nor is the logical arrangement of a mass of scientific facts necessarily the logical order of inculcating them*, a position strongly taken by Herbert Spencer, and one that is affecting all branches of education. "The mind of the pupil should be led from that which is familiar to that which is less so—from the known to the unknown." Professor Bastin, therefore, leads his classes to observe, *accurately*, roots, stems, leaves and other structures, with which they are already more or less acquainted, before the intricacies of all organization are taken up, requiring the use of the compound microscope and trained observing faculties. The elementary facts and principles of botany are presented simply, clearly and with regard to the natural growth of the student's mental faculties. The too liberal use of technical terms has been avoided. Familiar plants have been selected from which to illustrate structures, and a copious glossary is appended.

The abundance of illustrations throughout the work lighten the student's labor greatly. Most of these are drawn by the author.

Plants, and not books about plants, or mere botanical names, are insisted upon as the subject matter. First, the organs or instruments with which plants do their work, as roots, stems, leaves, parts of flowers, their forms and modifications are treated; then the microscopic details, and under the head of physiology the way plants and their parts do their work are discussed. The classification comes last, which in older works was made the main and first consideration.

The facts of evolution are strongly brought out in a matter-of-fact way, without the apologies, polemics or aggressiveness, thought necessary a decade ago in such a presentation. Professor Bastin became very adroit at this method of teaching, when, years ago, he taught botany (as well as all the other sciences) in the Chicago University. His students imbibed Darwinism without knowing that they had done so, and his associates, the theological professors, bewailed the degeneracy of the modern student's intellect in that it sought reasons for things in preference to relying upon tradition. Professor Bastin's pupils lost all relish for dogmatism, inspired or expired.

In Professor Bastin's book a defense of some nomenclatural changes would have been in order, for, however much they may really be justified in the teacher's mind, they shock those who learned the olden names of divisions, classes and orders into rubbing their eyes and pricking up their ears. Some of these changes the professor is not responsible for and these especially grate upon the sensibilities of an old-timer. For instance, though we may agree upon the abolition of hard and fast demarcations into genera, varieties, etc., some sort of classification, however arbitrary, is necessary. One of the most convenient mnemotechnical aids was the termination of the noun and adjective denoting the order, "*acæ*." Broad-minded old Asa Gray, who readily conceded the truths of evolutionism, but who left the work of revision to a later generation, affords us *Compositaceæ*, instead of *Compositæ*. The euphonious sacrifices in the case of

Labiata and *Leguminosa* even Gray had adopted, but if there is anything in the retention of a terminal to designate a division it should be general. In chemistry the endeavor to make all the metals end in "ium" or "um," as *Ferrum*, *Potassium* would be as unreasonably balked, if Hydrogen took rank as metallic, because Hydrogenium would sound oddly. Most of Professor Bastin's changes fall among the cryptogamous series.

He is celebrated for a vast amount of work upon plant hairs, which he modestly does not include in this work. The histological and physiological parts are very interesting, and form an important addition to general knowledge.

Professor Bastin is well known to scientists as a thorough-going conscientious student and teacher. He is fortunate in the companionship of an intellectual wife, to whom he dedicates his book. Her sympathy and interest in his work he affectionately acknowledges.

s. v. c.

COLUMBUS; OR, A HERO OF THE NEW WORLD. An historical play, by D. S. Preston. New York and London: G. P. Putnam's Sons, 1887; pp. 99.

This patriotic poem is highly praised by Edwin Booth, as well as by James Russell Lowell, and is dedicated to the latter in verses felicitously recalling those delightful hours in which he taught the Harvard students to appreciate Dante. The first act shows us Columbus in the Alhambra obtaining, through the generous sympathy of Queen Isabella, means to set out for America, despite the opposition of haughty nobles and superstitious priests. His whole tone of thought is so enthusiastic and imaginative that those who can share it will find nothing incongruous in the appearance of the guardian genius of the United States, which quells the mutiny upon the ocean. A similar vision ends the drama, which leaves the discoverer restored to the favor of his sovereigns, who had been temporarily offended by his disorderly administration, as well as by his sending Indians to Spain to be sold as slaves. There is action and pathos enough in the play to make it a success on the stage provided that these visions could be made to seem impressive to the audience. Perhaps we are too practical for this to be possible; but we can all read with sympathy the melodious lines in which the high-souled queen encourages and consoles the great discoverer, who is nowhere portrayed more nobly.

THE SAILING OF KING OLAF AND OTHER POEMS. By Alice Williams Brotherton. Chicago: Charles H. Kerr & Co., 1887. Price \$1.00; pp. 145.

The writer of these poems whom we have known hitherto mainly as a poet serious, devotional, and tenderly spiritual in her expression, comes to us in this radiant and beautiful little volume in a *role* new to us in her, but in the oldest and most delightful poet fashion—as a balladist of romance, and her "Sailing of King Olaf," "The Cardinals Saraband," "Dorothy Vernon's Flight," "Malison," "Saga of the Quern-Stones," "The Poison Flask" and others, will stir the blood of youth and age equally, the one from sympathy and the other for remembrance. The poems are divided into four departments, the first unnamed, the others under the headings "Carmina Votiva;"—"Rose Songs, etc.,"—and "The Inner Life." The artistic cover depicts the vessel of King Olaf on its weird trip, and the book is a credit to its publishers as well as to its author, whose charming portrait adorns the first page and gives an added value to her sweet singing.

THE series of Thackeray's letters now being published in *Scribner's Monthly* is sufficient to make that magazine a popular one, but apart from this it proves its *raison d'être* in the brightness and variety of its other articles. The July number continues the interesting "Illustrations of Napoleon and his Times," by

John C. Ropes, who gives us in addition to some half dozen new pictures (caricature and other) of Napoleon, those of Sir John Moore, Murat, Ney, Grouchy, Wellington, Blücher, and Sir Thomas Picton, from the author's own collection. "A Girl's Life Eighty Years Ago—selections from the letters of Eliza Southgate Bowne" will be found interesting reading as well to students of history as to the ladies. The story department is full and inviting.

THE JOURNAL DU CIEL, semi-monthly, is published by Joseph Vinot, Cour de Rohan, Paris, to popularize the study of astronomy and is the organ of the Society of Astronomy. All subscribers to the *Journal* are members of the Society. Other members pay one franc yearly. Those who choose to act as corresponding members will be furnished with instructions for observation and, so far as the society can afford it, with instruments. One hundred and sixty-two such observers were at work September, 1884. The society loans pamphlets, etc., to members who pay six francs a year, beside postage. The *Journal* itself for May 18 gives the Ephemeris, or time of rising and setting of sun, moon, Mercury, Venus, Mars, Jupiter and Saturn, with the positions of these and other planets, from June 27 to July 10. There are also records of observation of shooting stars, comets, etc. The *Journal* has had a prize from the Academy des Sciences.

INDIVIDUAL EXPRESSIONS.

Your paper improves in each issue.—WM. C. MILLS, Rockford, Ills.

I take much pleasure in reading THE OPEN COURT, and wish it a long and prosperous life.—ROSA L. SEGUR, Toledo, Ohio.

What a strong number the last one of THE OPEN COURT [No. 9]—almost too solid for this hot weather! I was glad to see Adam's name too.—W. M. SALTER.

Three cheers for your new journal, THE OPEN COURT. Also please find inclosed three dollars to renew subscription.—ISABEL UNDERHILL, Locust Valley, N. Y.

I deeply regretted the abandonment of *The Index*, but am so well pleased with THE OPEN COURT that I feel I have lost nothing.—EMORY P. ROBINSON, Sidney, Ohio.

The first numbers of THE OPEN COURT have been a pleasure and profit to me. I believe you have laid a foundation on which to build to literary and financial success.—H. C. FULTON, Davenport, Ia.

I think you ought to be overwhelmed with congratulations on the success of THE OPEN COURT. Certainly it is a wonderfully progressive paper, and grows more inviting every issue.—JANET E. REES, Morris Plains, N. J.

I do not feel so lonesome as I thought I would without *The Index*. The high character and sustained excellence of THE OPEN COURT leave nothing to be desired. In fact I would not well know how to get along without it. You may rest assured I shall miss no opportunity to procure subscribers to THE OPEN COURT.—R. J. MOFFAT, North Sydney, N. B.

Max Müller is one of the most prominent names in science and literature. It will give a great lift to THE OPEN COURT to have original articles from his pen, especially those you have secured, they being lectures that have been delivered at the Royal Institution. I wish you could enlist a few more of the European celebrities. Haeckel might be willing to contribute. He has been and may still be at Rhodes studying Medusa.—E. MONTGOMERY.

I was glad to read in *The Index* last year an article on "Protection"—*Incus a non lucendo*—analyzing its social and political development, and also one recently in THE OPEN COURT on "Ethics in Public Affairs," and I trust other writings of like import and spirit will occasionally appear in your columns. Class agitation and class administration constitute the *bete noir* of civilization and tend to deprave human conduct in all its dealings. But in the light of an "open court" I trust the uncleanness of this beast may be exposed and perhaps some day it will be disowned by the world.—JOHN HENRY ELLIOTT, Keene, N. H.

Some years ago I read several lectures delivered by you, and, while not believing that the evidence you based yourself upon at all justified your conclusions, yet I was pleased with your general treatment of religion, and believe that you are honest and try to be fair. It is to be regretted that neither Christians nor "infidels" always deserve the above praise, and it is a sad fact that Christians are frequently very unfair, and, along with many "infidels," are far from liberal under any reasonable construction of the term. My object, however, at this writing is simply to obtain a copy of THE OPEN COURT.—A. M. CARLISLE, Tall-hassce, Fla.

The Open Court.

A FORTNIGHTLY JOURNAL,

DEVOTED TO THE WORK OF ESTABLISHING ETHICS AND RELIGION UPON A SCIENTIFIC BASIS.

VOL. I. NO. 12.

CHICAGO, JULY 21, 1887.

} Three Dollars per Year.
} Single Copies, 15 cts.

[The second of Prof. F. Max Müller's three lectures on the "Science of Thought" is continued in this issue. This lecture on "The Identity of Language and Thought," and the third, on the "Simplicity of Thought," not published nor to be published in England, have been secured exclusively for THE OPEN COURT, in which both will be printed from the author's manuscript. This distinguished philologist believes that language is the history of human thought, and no other man living probably is as competent as he to read this history understandingly, especially those pages which indicate how men reasoned and what they thought during the world's intellectual childhood.]

THE IDENTITY OF LANGUAGE AND THOUGHT.*

BY PROF. F. MAX MÜLLER.

ONE OF THREE LECTURES ON THE SCIENCE OF THOUGHT DELIVERED AT THE ROYAL INSTITUTION, LONDON, MARCH, 1878.

Part II.

It is very strange to see how some philosophers are perfectly unable to see the identity of thought and language, while others never doubt it; and still *more strange to observe* how even those who clearly see that thought is realized and can be realized in language only, yet shrink from drawing the inevitable conclusion, that all philosophy has to deal in the first instance, and in the last instance too, with words, with thought-words, or word-thoughts. It may be both useful and interesting, therefore, to examine some of the leading philosophers as to the opinion which they held and expressed on this subject. Their answers in many cases will turn out to be very different from what one is led to expect from the general tenor of their philosophy.

There is a curious break between the so-called scholastic philosophy of the Middle Ages, and that stream of philosophic thought which, beginning with Descartes (1596-1650), has rolled on without interruption till it has reached the very threshold of this institution. That break has had its advantages, but there have been losses also, particularly in the want of precise language and terse argument on the part of our modern philosophers. Hence while scholastic philosophers seldom leave us in doubt as to their views of language and its relation to

thought, modern philosophers seem to imagine that they can either neglect altogether that fundamental question of all philosophy, or express themselves in ambiguous terms about it. If we ask, for instance, what Abelard (1079-1142), the disciple of Rosedinus, taught on the relation between language and intellect, he leaves us in no doubt, but states plainly in his own quaint words that "Language is generated by the intellect and generates intellect," thus showing that he had clearly apprehended the interdependence and essential identity of the two.

Hobbes (1588-1679), who among modern philosophers is still most in sympathy with the traditions of Mediæval scholasticism, declares without any hesitation that man has reason because he has language; and he adds, "It is evident that truth and falsity have no place but among such living creatures as use speech."

Locke (1632-1704), though fully aware of the importance of language in all philosophical discussions, could not bring himself to say that thought is either impossible or possible without language. "Most men," he says, "*if not all*, in their thinking and reasoning within themselves, make use of words instead of ideas, at least when the subject of their meditation contains in it complex ideas." This half-hearted opinion we find again and again in philosophers who shrink from the effort of resolute thought. They are ready to admit that it is *almost* impossible to think without words, but where this *almost* begins or where it ends, they never tell us.

Even Leibniz (1646-1716), who may truly be called the founder of the Science of Language, seems rather an unwilling witness to the inseparableness of language and thought. In his "Dialogue on the connexion between things and words," he says "It troubles me greatly to find that I can never acknowledge, discover or prove any truth except by using in my mind words or other signs." To which his friend answers: "Nay, if these characters were absent, we should never think or reason distinctly."

While Locke and Leibniz were thus constrained, almost against their will, to admit the impossibility of thought without language, Berkeley, their worthy contemporary and rival, was convinced that words were the greatest impediment to thought. He became so angry with language, that in one passage he declared he would

* Copyright, 1887, by The Open Court Publishing Co.

in his future inquiries make as little use of language as possible—an Irish bull which was omitted, however, in later editions of his work.

Hume (1711–1776) agrees with Berkeley that we possess no general ideas, but particular ones only, to which a certain term has been annexed which gives them a more extensive signification. But whether these terms had any existence before they were thus annexed, and, what is still more important, whether it is possible to think without these terms, Hume, so far as I can see, never declares in any decisive passage of his works.

It is curious that even Kant (1724–1804) should have said so little on this vital question of all philosophy. He calls language the greatest, but not the only instrument of thought; he admits that without expressions accurately corresponding to their concepts, we cannot become quite intelligible either to ourselves or to others. He declares in one passage that to think is to speak with one's self. But from the very cursory nature of these remarks, we may safely conclude that the problem which occupies us at present, did not excite his special interest, but took its place as part and parcel of the more general problems of his philosophy.

But while Kant thus disappoints us, his townsman, Hamann (1730–1788), a man of wonderful genius, though little known outside Germany, utters no uncertain sound. "Language" he says, "is not only the foundation for the whole faculty of thinking, but the central point also from which proceeds the misunderstanding of reason by herself." And again, "With me the question is not, What is reason? but, What is language? What we want is a Grammar of Reason."

The greatest minds of Germany were all at that time approaching nearer and nearer to the truth, I mean to a perception of the absolute identity of language and reason. Herder (1744–1803) declares his conviction that "without language man could never have come to his reason," and I do not hesitate to add, that, without language man could never have come even to his senses.

William von Humboldt (1767–1835), the greater of a *par nobile fratrum*, wrote: "If we separate intellect and language, such a separation does not exist in reality."

Schleiermacher (1768–1834), the translator of Plato, and at that time the most powerful among liberal-minded German theologians, chimes in with a still clearer note: "Thinking and speaking," he says, "are so entirely one that we can only distinguish them as internal and external, nay even as internal every thought is already a word."

The two most prominent leaders of philosophical thought in the beginning of our century, Schelling and Hegel, divided as they were on many other points, are quite at one on the identity of reason and language. Schelling (1775–1854) says: "Without language it is impossible to conceive philosophical, nay, even any

human consciousness." Hegel (1770–1831) proclaims his conviction still more boldly and tersely: "We think in names," he says, as if no one could ever have doubted it.

It may seem a rather violent transition from Hegel to Alphonse Daudet, but in some cases the man of the world, and, we must add, the minute observer of the world, may catch glimpses of truth which either escape the metaphysician altogether, or are at all events not apprehended by him at their realistic fulness. When Daudet wrote his *Roumestar*, it is well known that Gambetta imagined it was aimed at him. He recognized some traits of character in Roumestar which he had discovered in himself, though he imagined that nobody else suspected them. One of them was that Roumestar was unable to think unless he could speak. After a time Gambetta and Daudet met at a dinner, given by Hébrard. They sat silent for a time, till at last Gambetta burst out: "Where did you get the words which you make Roumestar say, 'if I do not speak I cannot think.'" Daudet replied, "I invented them." "That is strange," Gambetta replied. The same evening Gambetta and Daudet became reconciled. They seemed to know each other better, and, perhaps, to know themselves better—than many philosophers do.

Of course we must make a distinction. Gambetta felt that he really could not think without speaking, that is to say, without speaking in a loud voice. That was his peculiarity, and it may be a peculiarity common among the people of the South. What Schelling and Hegel meant was not that we cannot think without uttering words, but that we cannot think, even silently, without words. Savages call that kind of thinking, speaking in the stomach, and it would be difficult to find a better name for it.

To return, then, to Schelling and Hegel and their illustrious predecessor. I confess that to myself also it has always seemed incredible that language should ever have been conceived as something that will exist by itself, apart from our whole intellectual nature, or that thought, on the other hand, should have been considered as possible without language. We have only to try the simplest experiment and we shall find that thought, divorced from language, is an utter impossibility. We may see a dog, but if we ask ourselves what it is, if we want to *know* what we see, we can answer by the name "dog" only. Even if we had never seen a dog before, we should still answer by a name only. We should say, it is a quadruped, an animal, or a living thing, a something, but we could do all this by names only, by what the ancients called *Nomina*, i. e., *gnomina*, means of knowledge.

We know, however, what philosophers can achieve, nay, I believe it would not be difficult to show that the sway of philosophical mythology is more powerful even than that of religious mythology. Because we have a name for thought and another for language, therefore,

it is argued, there must be thought without language and language without thought. We might argue in the same way that, because we have a name for the outside and another for the inside of a thing, therefore there must be an outside without an inside, and an inside without an outside. We were told at school that the Greeks must have been very strange people, because they had but one word for language and thought, namely, *Logos*, but that they afterward perceived the folly of their ways and distinguished between the *Logos ἐνόησις*, thought, and the *Logos ἐκφορικός*, language; as if the ancient Greek conception of language and thought as one, did not show a far greater insight, a far more powerful grasp than the later distinction, useful as it is, between the outside and inside of thought.

However, I can with some effort enter into the mind of those who, like Berkeley, look upon thought as one thing and on the sounds which we call words as quite another. It is a kind of philosophical hallucination, but there is at all events some method in it. What I cannot understand is, how philosophers can halt between these two opinions, how they can admit that *most* of our thoughts are carried on in language, but not quite all; that *most* people think in words, but not all; that complex arguments may require words, but not simple propositions. What should we say of a mathematician who maintained that for simple addition and subtraction he did not require numbers, but that they were indispensable for higher mathematics. I need hardly say that when I speak of words, I include other signs likewise, such as figures, for instance, or hieroglyphics, or Chinese and Accadian symbols. All I maintain is, that thought cannot exist without signs, and that our most important signs are words.

Among modern English logicians there is a curious lack of courage on this point. The only one who has what is now called the courage of his opinions, is Archbishop Whately. He declares without any reservation that logic is entirely conversant with language. All the rest shake their heads from one horn of the dilemma to the other. Sir William Hamilton deems Whately's opinion too absurd to be imputed to an archbishop. John Stuart Mill, though in this case less bold than the archbishop, stands up for him so far at least as to try to convince Sir William Hamilton that the formation of concepts and the subsequent process of combining them as arguments, must be considered as a process of language. But Mill himself, in his great work on logic, cannot muster the same courage as Whately. "Reasoning," he says, "the principal subject of logic, takes place *usually* by means of words, and in all complicated cases can take place in no other way." But by what other way it can ever take place he never shows. He calls language one of the principal elements or helps of thought, but he never mentions any other helps or

instruments. He speaks of the reasoning of brutes, but forgets that this is but a metaphorical expression, and that we know nothing of the inside of brutes, except by analogy. He mistakes the abbreviated or silent reasoning of man for reasoning without words, though he would easily have seen that in substituting algebraic or logarithmic signs for the ordinary figures, the mathematician is dealing indirectly with numbers and with numbers only.

The same uncertainty pervades nearly all our handbooks of logic. Archbishop Thomson follows indeed the good example of Archbishop Whately, when he says that we get entangled in absurdities by any theory which assumes that either thought or language existed in a separate state, but he shrinks from drawing the conclusion, that logic deals with language and with language only.

Mr. Jevons cannot bring himself to say that we *never* think without words, but, as a cautious reasoner, he adds, "*Hardly ever* do we think without the proper words coming into the mind."

Professor Fowler seems inclined to follow Archbishop Whately. "*Practically*," he says, "we always think by means of language;" yet, he adds, "a logician need not come to a decision on this point." Can there be a more vital question for a logician than this? Would any writer on Optics venture to say: "Practically we see with our eyes, but the optician need not make up his mind on this point." Professor Green, a very honest and straightforward thinker, is affected by the same hesitation. "It is hard," he writes, "some say it is impossible, to think without expressing thought in language."

To me it seems inconceivable how any philosopher, that is to say, a student of thought, can leave such a question undecided. I can understand, as I said before, certain minds being so completely under the spell of philosophical mythology as to find it impossible to conceive that thought, which has a name of its own, should not have a separate existence, apart from language. The ancient nations, because they had called the Unknown by many names, became polytheists, and powerful thinkers only, such as Æschylus, could perceive behind the many names, the one God. But what I cannot understand is how people could be half polytheists, half monotheists, or, as applied to thought, how they could bring themselves to believe that thought, though generally embodied in language, could from time to time walk about as a disembodied ghost. I have myself not the slightest doubt that the time will come when this belief in disembodied thought will be looked upon as one of the strangest hallucinations of the nineteenth century. People do no longer believe in witches, nor in ghosts. But the belief in disembodied thought will die very hard, nay history teaches us, that though it was

scotched by some of our most powerful thinkers, it always raises its head again and again. If anything can give it its *coup de grâce*, it is the Science of Language, though, strange to say, some of the most popular representatives of that science are against us. Here, as elsewhere, we must have the courage of our opinions. We must make no concessions. We must say "Never," not "Hardly ever," and this "Never," I feel convinced, will mark a new departure in the history of philosophy, nay it will supply a new foundation for every system of philosophy which the world has ever known.

THE WORLD'S SUN AND SAVIOR.

BY RICHARD A. PROCTOR.

There is a passage in Renan's *Vie de Jesus* relating to the worship of Mithras which, at a first reading, appears almost like a jest. After describing the attraction which this cult seemed to have for the various nations and races under the government of Rome, he goes on to say that he has sometimes permitted himself the thought that, had not the religion of Christ become predominant, the religion of Mithras would now be the worship prevalent throughout the world. Considering that the religion of Mithras was unquestionably the worship of the sun, what Renan thus said sounds to the average Christian, to whom the religion of Christ is the worship of God the Son, as incongruous and outrageous as it would seem to the average Briton or American to be told that, had not English become the predominant business language, Hawaiian would have prevailed as the business language of the world. But the apparent wildness of Renan's remark disappears when we recognize the evidence which shows its unquestionable justice. The people under Roman sway turned as eagerly toward sun-worship in its various forms as the people of Israel turned to the cognate worship of the host of heaven. And even as it is by no means clear that the Israelites ever really escaped from the Sabaism of their forefathers, seeing that to this day the whole ceremonial of the Jewish religion is obviously based on, if it is not actually the same as that employed in, the worship of the heavenly host, so it is by no means certain that the races which embraced Christianity really gave up sun-worship, seeing that not only do all the days and seasons, with most of the observances of sun-worship, remain in Christian ceremonial, but the whole story of the sun is retained in two at least of the gospel records of the life of Christ. In fact it might be suggested, without any violent improbability, that the struggle between the religion of Christ and the religion of Mithras, considered by Renan, was only one form of sun-worship prevailing over another, the worship of Serapis overcoming the worship of Mithras. There is a passage in a letter of the Emperor Hadrian not so often quoted as the very doubtful testimony of Tacitus, but much more significant

and having the advantage of being certainly genuine, in which he specially states that the Christians, as he had known them in Egypt, were worshipers of Serapis, the sun-god, and that their chief priests were known as "bishops of Christ!"

It may be remarked just here that now when the doctrine of evolution modifies all our views respecting the progress of nations and races, not only in civilization and culture but also in morals and in religious ideas, there is nothing surprising in the presence of very decided traces of nature-worship in all modern forms of religion. The wonder, indeed, would be great if no such traces could be recognized. For while it is certain that apart from a supernatural revelation (in which, I suppose, no intelligent reasoner can now believe) every race which passes beyond a certain stage of culture must attain to sun-worship as the highest and purest form of nature-worship, it is well known that no matter how religion itself may change, religious ceremonial can scarcely ever be modified. Moreover it is observable of all forms of religion and of all moral teachings, that no matter what the real history of their founder, the story of the sun, most impressive of all nature's myths, was invariably combined, sooner or later, with the narrative of his life. So was it with Confucius, with Zoroaster, with Gautama; and it is natural that so also it would be with Christ. Precisely as in the second century the writers or compilers of the gospels according to (but certainly not by) Matthew, Mark and Luke mixed up with the account of one Jesus events which, as every reader of Josephus can perceive, really belonged to the history of other men (most of them also named Jesus), some of whom were alive when Jerusalem fell (or more than a generation after the death of Pontius Pilate), so those same writers or compilers deemed it necessary to show also that all the remarkable signs, tokens and events belonging in the ancient solar religions to the successive sun-gods appeared or occurred also in the history of the Son of God.

That the worship of the sun should prevail for a long time in the history of each advancing race, after the earlier and less impressive forms of nature-worship had in turn prevailed and died out, was altogether natural. The daily victory of the sun over the powers of darkness, his triumphant return to power ("rejoicing as a giant to run his course,") in the midsouthern heavens, and his slow decadence thence, must early have attracted the attention of the least observant. It was natural that, even in that first beginning of solar religion in which the sun was regarded as god of the day, men should hail his return with prayer and sacrifice as he

"Flatter'd the mountain-tops with sovereign eye,
Kissing with golden face the meadows green,
Gilding pale streams with heavenly alchemy."

Equally natural was it that, as he sank in the west

prayer and sacrifice should again be offered, now not in adoration but in propitiation, lest the wrathful red of the western skies should portend his angry departure from the world whose life depended on his beams. With a slight change we may believe of the respective races who were the first parents of modern nations what Blanco White, in a fine sonnet, suggests in regard to the impossible first parents which were assigned by men ignorant of biological possibilities to the whole human race—when those first parents noted the coming on of night:

“Did they not tremble for this glorious frame,
This wondrous canopy of light and blue?”

So, trembling, they offered propitiatory sacrifices, after man's way when anxious about his personal welfare. And a race of priests came into existence, quite as naturally, who undertook, for a consideration, the important business of offering the morning sacrifice of adoration and the evening sacrifice of propitiation.

But, as longer observation showed men the sun as god of the year, a much more impressive doctrine and a much more complicated ceremonial came into existence. By this time, it must be remembered, the influence of the heavenly bodies—sun, moon, planets and stars—upon the affairs and fortunes of men and nations had come to be accepted by all. It is difficult for us to realize the confidence with which our own forefathers as well as those of all other races, accepted this doctrine. Nowadays none but the ignorant and unwise believe in astrology, and none but rogues pretend to believe, but in remote times, and thence onward through the beginnings and developments of the religions even of to-day, faith in the influences of the heavenly bodies was almost universal. When this was so—when the star-strewn heavens by night and the wondrous canopy of light and blue by day were men's temple, before as yet the sun and moon and planets had descended from their dignity as gods—can we wonder that the annual progress of that sun-god, whose glory meant life, while his departure to the gloomy cave of winter meant death, should be watched with special interest, alternating between anxiety and hope, by all men? The story of the sun-god as the savior of men was repeated every year before men's eyes, though only the priests who were practiced astronomers could tell the exact times when he passed the chief stages of his career.

Consider the life of the sun as god of the year, and we can see a reason for every detail in the ancient solar myths and in the records of the life of the various sun-gods.

Begin with the failing of the power of the sun during the autumn months—for we cannot rightly understand the meaning of the sun of a new year until we have considered the feelings with which in old times men must have watched the gradual departure (as it

seemed) of the mid-day sun from the region of glory he had occupied in the midsummer heavens. Day by day toward the time of the autumnal equinox the mid-day sun sinks lower and lower. Nay, as day follows day his rate of sinking grows more and more rapid, his diurnal arc from the eastern to the western horizon grows shorter and shorter, until the roughest instrumental means—dial, shadow-throwing obelisk or what not—shows how the mid-day strength of the sun-god is waning. A fit time this for sacrifice and prayer, for sacrifice of thanksgiving because of the work the waning sun has done, the beneficence he has displayed during the months of summer; but a time also for sacrifice of propitiation lest the sun-god should depart in anger from the world. We see the clearest traces of the diverse feelings with which men watched the retreat of the sun in autumn toward the gloom of winter in the Feast of Tabernacles celebrated by the Jews at this season, a feast rivaled only in importance and duration by the Feast of the Passover in spring, and in the Fast of the Atonement, the most characteristic feature, perhaps, of all the Jewish ceremonial system. I am told that to this day the Jews regard the due observance of this day of mourning and lamentation as the most marked duty of the year. Now, as of old, though no longer in the same way, the soul that does not mourn and lament on this great fast day is cut off from among the people. And doubtless in the far-off days, when in lamentation on this day the people appealed to the retreating sun-god, at the time when his retreat seemed most rapid, to return to them, it was a solemn duty on the part of each member of the community to join in the prayers and lamentations by which they hoped to prevail on their god to return to them.

Thenceforward, as week after week and month after month, measured by the orb that ruled their night (the Measurer, as they called her)* passed on, they found their god sinking lower and lower. Shamash, Shemshin, Samson, the power whose might lay in his rays, was shorn of his beams by Delilah, the gathering gloom of winter. Yet there remained this to encourage hope of his restoration: daily he sank lower and lower, but each day he sank less than the preceding. At last it seemed as though when men's hearts had sunk lowest (for the bulk of the community would know nothing of those tokens of return which would seem clearest to the astronomers, their priests), he ceased to sink any lower. The sun of the old year had reached that point where his career ends, and lo! such life as remained in him was to be passed on to his son. The threatened desolation was to be averted. The priests recognized the approaching advent of the Savior of the world. As day by day they watched at this season of the winter solstice, the most delicate observations possible in those days disclosed no evidence of the return of the sun to

mid-day power; the sun stood still. And to the thoughtful mind there is much significance in the continued use of the word solstice, seeing that the sun does not, in the astronomical sense, even appear to stand still. We see how much attention the astronomer of old directed to the sun at mid-day when we find a word strictly referring to the sun's mid-day height still used as if it referred to the sun's course along his yearly apparent path.

At last, three or four days after the winter solstice, it became clear not only that the sun had ceased to sink lower, but that he had even begun to pass higher at his mid-day culmination. His places of rising and of setting were also now manifestly slowly shifting from their most southerly positions back toward east and west respectively. But not until the heliacal rising of a certain star gave the desired astronomical evidence of the return of the sun to his new year place could the astronomical priests announce the birth of the sun-god. Then they proclaimed the nativity of the Savior of the threatened world; for then these magi could announce that they had seen his star in the east, heliacally rising before him, standing over the place (the "cave," as the unseen half and the southern half of the celestial sphere were alike called) where the Savior was born. The Virgin (constellation and sign both) in those days was in the west, with upraised arms stretched toward her son, fading out of view and sinking below the horizon as day advanced.

Thenceforward, day by day, week by week, month by month the youthful sun-god increased in strength and wisdom (in the power of his heat, in the glory of his light) till at length the time came when he was to pass from the winter half of the celestial sphere, crossing the mystic circle which divides that half from the region of the sun's glory and might in summer. At that crossing—that passover, that crucifying—came naturally the most solemn festival of the whole year. Associated with the moon's movements (for so only could months be determined) its astronomical character to this day attests its actual origin. The same priests who had proclaimed the birth of the sun-god proclaimed his rising above the great dividing circle. The sun is risen, he is risen indeed. Forty days (such seems to have been the special time appointed for watching his approach to this critical circle) they had observed him nearing it; now for forty days more they watched him moving along what is still called right *ascension*, and is still measured by astronomers from this very crossing place. Then, and then only, his ascension was completed (and Ascension Day still measures forty days from Easter). Thereafter he passed to his throne of glory in the midrealm of the heaven father.

And so year by year the story of the sun-god was repeated, and the festivals and fasts, the sacrifices and

prayers were renewed till they entered into the very life of the people, never to be given up, no matter what changes might come over their forms of belief.

CHATS WITH A CHIMPANZEE.

BY MONCURE D. CONWAY.

Part 17.

On going to my tryst next day I was stopped by a policeman, who informed me that Lord and Lady Somebody and Maharajah Somebodyelse and their suite were visiting the Monkey Temple. I lost nearly an hour of my Chimpanzee in this way. When at length this fine party came out to their sedans they looked to me—the English especially—like tawdrily dressed creatures carried about as a show. Monkeys are carried about in some cities, but so much had my respect grown for monkeys that these visitors, still laughing at the monkeys, without in the least comprehending them, seemed, for the moment, the inferior order. The illusion was heightened by the absurdity that such commonplace people should possess the privilege of seeing others kept at a distance from any place where they wished to move. I could not help growling in this way, and before I knew what I was doing began on an unpolite quotation from Shakespeare about "man, proud man, drest in a little brief authority," plunging on to the words, "like an angry ape," before I realized how personal the similitude was.

"I really beg your pardon," I cried.

"Go on with the quotation," said the Chimpanzee "I like the phrase."

"Like an angry ape, plays such fantastic tricks before high heaven as make the angels weep; who, with our spleens, would all themselves laugh mortal."

"Good!" cried the Sage. "That writer's memory ran a long way back. The man drest in brief authority and of fantastic tricks was actually evolved from the Angry Ape."

"Why angry?"

"Ah well, I must leave much to your imagination. You will bear in mind that mankind were developed from a monkey aristocracy. The few first talkers kept together, mated together, reproduced their superiorities, and thus an aristocracy of birth was formed."

"I have been taught to resent the idea of hereditary aristocracy."

"Possibly, but rather, certain historic perversions of it like the Hindu castes. There can be no real aristocracy except that of birth or heredity. So all would perceive if every superiority attested high birth instead of the merely accredited birth attesting superiority. Titled and crowned people are often low-born. In our anthropoid commonwealth we had no superiorities; when the talking aristocracy was formed they began to have trouble. The power of speech had been really developed by the continued mating together and interbreeding

of those who approximated articulate utterance. But these were as yet few compared with the chattering multitude. The mysterious power of the talkers excited at once the fear and the jealousy of the masses. The angry ape appeared at the head of a mob. The talking aristocracy would have been all slain had they not been able, through their power of communication, to combine more perfectly than the others. Under certain circumstances, it has been said two and two do not make four, but forty. So it was when the first talkers confronted an inarticulate rabble. However, the atmosphere of anger became intolerable to the talkers, and they all fled. They migrated from forest to forest, hoping that they might find some talking tribe to unite with, for they were too few to hold their own against the more ferocious animals. One day—so runs the legend—when they were seated amid the foliage of a tree they observed a handsome anthropoid animal approach; he took a palm leaf, on it made some marks with a stick, then fastened it to a tree and went on his way. They all got down and examined the leaf, finding on it strange marks of yellow color. They left the leaf where they found it, resumed their seats in the tree, and watched to see what would follow. Soon another, a female even handsomer than he who had marked the leaf approached, took down the leaf, scrutinized it, then followed on the exact path the other had gone. Thereon the whole company, after a brief consultation, pursued the solitary figure and surrounded her. They treated her gently, and, when her fears were soothed, found that she could talk a little—less than themselves. But she had a talent which they had not; she could make marks on any surface corresponding to sounds she uttered. She made them understand that she was one of a small company which had developed a power of communicating silently by these marks on leaves, and who, like themselves, had become objects of jealousy and fear to their tribe. They, too, had become exiles. She guided the company to her friends; these talkers and writers became allies, and together they went on a pilgrimage to find other allies of similar advancement. They found a few here and there, and at length had gathered a sufficient number to form a powerful tribe.

Now, it had become, among all the monkey tribes, a rumor, then a tradition, that somewhere there existed a society of nobler beings, a realm of angels. The talking and writing people in the distance were thus dreamed of among the lower tribes; but whenever any one was found among them developing these angelic powers, he was slain, or had to fly. Such exiles sometimes found their way to the nobler commonwealth.

“You will observe that by so steadily exiling or slaying their superior minds the old ape tribes doomed themselves to remain apes. The race of inferior monkeys has been developed from those who rendered progress

impossible. The survival of the fittest for preserving their old social order became their principle of existence. On the other hand the exiles drew to themselves every variation and improvement which had excited the fear or jealousy of their fellows. Some of these variations were intellectual, others physical. Two or three would come bringing an improved heel, others a rudimentary thumb, yet others a shapelier nose or chin. It had been gradually recorded on palm leaves that these peculiarities could be transmitted to children. Certain scribes were appointed to observe and register the results of mating one superiority with another. Natural affections followed the lines of improvement so indicated, and any affections contrary to the laws formed by experience died out—as now, in Christian societies, sexual feeling between brother and sister has been extirpated. Here, too, as already mentioned in the case of an earlier phase, freedom was the great factor in the evolution. So long as the principle of selection was purely and exclusively determined by improvement of the race—there being no restriction whatever for the sake of any god—the evolution was rapid. The progress to humanity was by grand leaps. As in the case of speech, obtained by an infinitesimal change of form, leading on infinite effects, each subsequent attainment surrounded itself with a new world. Take this city of Benares; within my memory it has been transformed from a village to a city. By what means? By a kettle of water. One man put a valve on it that would bind or loose its vapor at will. Another set the kettle on wheels and called it a steam engine. The face of the world is changed. That kind of thing happened millions of times. Each little step taken opened a world of resources, with powers to utilize them. Man was developed.

“But as the first developed talkers and writers had been comparatively few, so the first men were comparatively few; and these, like their forerunners, were pursued by fear and jealousy of the half-humanized. In this higher commonwealth the dismal story of the anthropoid tribe was repeated. The aristocracies of intelligence and beauty were forced to flee, and in the end formed a society which began the works of human civilization. So it went on for ages. The ape seemed to have died out of this new form. He might reappear in the fantastic tricks of boys, but education soon bound him. But, alas, though physically bound he survived morally, and, in the further progress of the human society, made himself felt. For man found himself surrounded by obstructions and enemies. Serpents, wild beasts, diseases, hurricanes, drouth and famine beset him. He fought these bravely and steadily made headway against them until it unfortunately occurred to some of the least courageous to try and explain them metaphysically. Now there had been preserved from

their ancient apehood a tradition of the wrathful gorillas or other creatures against which the more human forms had been defended. In dreams the hated and hunted ancestors of humanity have been haunted by visions of the Angry Ape. There now arose some mystery men who ascribed outward reality to the vision coined by fear, and imagined that there must be a gigantic Ape, creator and god of apes, who was angry and jealous at the way in which some of his creatures had taken the work of creation into their own hands. The idea once started response came from the closeted ape lurking in each of the least developed. These now ascribed thunder and lightning, tempests and diseases, to the wrath of the Supreme Ape, and there grew a panic-stricken clamor for men who could pacify the Ape demon. In response to this clamor appeared the priesthood.

"The priesthood declared that the jealous and angry Supreme Ape would destroy them all unless they gave him the larger part of their food, and built temples to him, and in these supported a large number of men to kneel before him, acknowledge his supremacy, and sing his praises all the time. I have somewhere one of the litanies to the Eternal Ape."

"I should much like to see it," said I.

The Chimpanzee went off and returned with some very old and dry palm-leaves, from which he read me the following

LITANY TO THE HOLY APE.

O, Ape of Apes, we acknowledge Thee to be our Creator and Ruler!

Thou art angry with us nearly every day.

Just art Thou, visiting our sins upon our children.

Thou art so very, very just!

Anger is thy customary attitude.

Thou art angry that we should keep Thee angry.

We have wickedly eaten the fruit of knowledge. Mad art Thou!

We have walked in the light of our own eyes. Mad art Thou!

We have followed the guidance of our own hearts. Mad art Thou!

We have set before us the wisdom of man instead of fear of Thee.

Mad art Thou!

We have not remembered that the wisdom of man is foolishness to the Great Ape. Mad art Thou!

Thou god of wrath!

Thou jealous god!

Thou god of battles!

Almighty Gorilla!

The sun is Thy throne and the sun-stroke Thy sceptre.

Whirlwinds are wheels of Thy chariot.

Common sense cannot stand before Thy uncommon abilities.

Thou sendest Thy plagues and our reason is silenced.

The thunder is Thy argument.

The logic of Thy lightning is irresistible.

Weak-minded were he who would withstand the persuasiveness of Thy pestilences.

Pity, Everlasting Ape, our inherited depravity, our tendency to think for ourselves!

Through accursed human knowledge we have strayed from Thy ways like lost monkeys.

Yet, O Holy Ape, much of the monkey is left in us still.

We can still turn from the tree of knowledge to the tree on which cocoanuts grow.

Though we look like men not much of the spirit of men is left in us.

We will part with all of it if Thou wilt smile on us.

Thou shalt have our virgins, or Thy priests shall.

Also, two-thirds of our wool.

Likewise of our bread and butter.

All who deny Thee shall be roasted.

Only spare us, spare us, Holy, Eternal, Omnipotent Ape!"

"Good God!" cried I with excitement, as the Chimpanzee ceased.

"Good God!" said he, looking around. "Who is he?"

"It was only an exclamation," I answered; "nevertheless—"

But before I could enter upon any theistic discussion a gust of wind, from a storm whose rising we had not noticed, broke through the court and scattered the litany leaves. They were tossed among the monkeys who found great fun in chasing them. The happy possessors of the inscribed leaves perched themselves at various points, when, surrounded by eager groups they played with their treasures. But the leaves were very ancient and dry, and in a few moments they were all reduced to fine dust. Just then a great crash of thunder came, and my old Chimpanzee looked up with a twinkling eye.

"O Angry Ape," he cried, "you have overdone it this time with your fantastic tricks, and puffed out of the world your last litany."

"I am not so sure of that," I remarked.

DEMOCRATIC THEORY AND PRACTICE.

BY W. L. GARRISON, JR.

In considering the right and the necessity of admitting women to the franchise—opening the door of opportunity to the hitherto suppressed majority—the still larger question of universal suffrage presents itself. It may safely be affirmed that many advocates of woman suffrage are unprepared to accept the logical consequences of their principles. The line must be drawn somewhere, but each disfranchised class would draw it so as to include itself, whatever becomes of those left shivering outside of the body politic. When it was proposed to admit the freedmen to citizenship, there were women of prominence who would have prevented the precedence of the negro. The plea was plausible that the educated women were much better fitted to vote intelligently than the imbruted product of slavery, and only political necessity forced the ballot into black hands, as the same necessity had already compelled Mr. Lincoln to proclaim emancipation.

A recent writer in the *North American Review* has called attention to the varied and unequal laws that determine the right of suffrage in the different States and Territories. No uniformity prevails. Whatever

may be our Fourth-of-July opinions regarding democratic institutions, the fact remains that the democratic theory of the founders of the republic is as little regarded in practice as was the Declaration of Independence in the days of slavery. Therefore the oft-heard, doleful complaints or predictions of the failure of a republican form of government, and the assertion that our democratic experiment is on trial, may be truthfully met by the affirmation that the world has never had a republican form of government, and the only thing on trial is the usurpation which calls itself a democracy.

Why be deceived by names? Until the right of the most ignorant, the poorest and even the immoral to be represented at the ballot-box equally with the learned, the rich and the virtuous is acknowledged, we fall short of the saving theory that "government derives its just power from the consent of the governed." Otherwise the unfortunate classes alluded to must be excepted from the definition of people. When Mr. Lincoln characterized our government as "of the people, by the people and for the people," who can suppose that he meant to eliminate the very ones whose hope and encouragement lay in self-government?

In nearly all governments recognizing the monarchical theory, wealth and learning have known how to protect themselves. Unprotected, unrepresented and uncared for, except in so far as they could be used to serve and profit the powerful classes, the common people have toiled, and suffered and died. Democracy is the final attempt of human nature to vindicate its own dignity and trustworthiness. From immemorial times the government of the many by the few has been the rule. Under the plea of divine right, or personal might, or the natural order of society, tyrants have been in the saddle, and the mass of mankind have been trodden in the dust. Democracy proclaims the inherent and natural rights of every being wearing the human form. No person, however lowly, however unlearned, however lacking in virtue through ignorance can rightfully be excluded in choosing the rulers of all. The only basis of self-government is abiding faith in humanity, and a recognition that all human growth tends heavenward as naturally as plants seek the light.

These axiomatic truths need emphasizing nowhere more emphatically than in this republic, where with the increase of material comfort and education comes also the assumption of the rich and educated that they alone should control the franchise. One wearies of the fashionable objection to giving woman her political rights, everywhere offered by those enjoying the prerogative, that "we have too wide suffrage already; it should be limited rather than extended." No voter has ever yet been discovered who unselfishly says "as suffrage is too broad, therefore, deprive me of my right to vote." Test him by that proposition and he talks of the tea-party in

Boston Harbor and of Bunker Hill. The divine right of the royal family of Russia to govern is not more an article of faith with the Czar, than is the conviction of the legal voter of the United States in his divine right to the ballot.

Is it not, therefore, the most effective way of liberating woman to strike for the right of every human being governed, to have his voice represented and recorded at the polls, with only the acknowledged exceptions which bear unfairly on no one? Of course it is necessary to agree that an arbitrary limit of age must govern the admission to citizenship, although we admit that many under the prescribed age may be more competent to vote than many above it. The rule savors neither of injustice nor proscription.

A proper rule of probation for foreigners before voting is justifiable. Otherwise elections might be carried by importations of people who had no purpose to remain; but foreigners intending to become *bona fide* citizens need not be long excluded. The feeble-minded and the insane have no opinion to be recorded, and the criminals, having deliberately violated laws in whose making or retention they have an equal voice with all others, have forfeited, for a period at least, their right to be consulted. Having proclaimed themselves enemies to society by their acts, they cannot justly complain if society protects itself by excluding them from it.

With these exceptions can a true democracy debar from citizenship even its most unpromising members? At present the artificial line of sex is drawn in all the States, with partial exceptions of a limited nature in a few. In Rhode Island property qualifications obtain; in other States educational tests are used, and race differences are an excuse for disfranchisement.

The legal inability arising from sex is receiving too wide-spread discussion to need any consideration here. The near and complete recognition of woman's equal citizenship is certain.

The property qualification has not made Rhode Island a model of self-government, and its speedy abolition is a foregone conclusion. Virtue and poverty are not incompatible, and wealth is often the possession of the ignorant. An educational test can be urged with more show of reason, but will not bear examination. It is preparing one to swim while prohibiting him from the water. Liberty is the only possible preparation for liberty, and to borrow Mr. Lowell's admirable statement, "the best way to teach a man how to vote is to give him the chance to practice." The disfranchisement of vice is impossible because a moral test is impossible, excepting at the line of law breaking. Rags and squalor are deceptive tests, as the distinguished bank-presidents and mill-treasurers resident in our State prisons demonstrate.

If the democratic theory is true that responsibility

educates, that rights and duties are reciprocal, it is the very classes which fastidious critics of our form of government would exclude from the polls which most need to be brought there. Unless the assumption is correct that the mass of the people are really interested in good government, if only shown where their interests lie, we may as well abandon self-government and go back to "the reign of Chaos and old Night."

The founders of our government probably never dreamed of the strain our institutions would incur from the inundation of foreigners, bred under despotism and precipitated *en masse* into our politics. That the system has borne the strain so well, and assimilated with success such apparently indigestible material, is proof enough of its vitality and virtue. It takes but a generation to transform aliens into law-abiding American citizens. The process is not always savory, but the product repays. It is natural that abuses should be developed and mistakes made, but as the people cannot escape payment for them, they learn self-government most through suffering and discipline.

It cannot be demonstrated that one class was ever able to understand and represent the needs of another. No matter what sophistry is offered in its justification it is a power that cannot be delegated. Every disfranchised class in a republic is an oppressed class, be it women, Indians or Chinese. From national contempt and hatred the negro has, by virtue of the ballot, gained the deference of all political parties. Our theory of government allows no place for disfranchised subjects. Their existence irritates and festers to the discomfort of the whole body. The Indian, protected by law through the constitutional method of the ballot, and subject to its enactments, loses his dangerous nature and becomes harmless as a citizen. The poultice of suffrage allays the sore of barbarism, and justice is a better safeguard than armies. Our Chinese population awaits the same remedy, and American politicians will yet study the language of compliment for the countrymen of Confucius when they cast American votes.

Democracy suffers the penalty of its own disobedience. It cannot have peace or safety while it refuses to live up to its creed. Deprived of the national method of expressing dissatisfaction, the disfranchised find more dangerous vents for their discontent. Suffrage is a safety-valve. Dumb abuses grow in silence, and attain threatening proportions before society is aware of their existence. Gifted with speech they call attention to themselves for their own destruction. Suppression in Russia produces dynamite and assassination. Expression in America secures a guarantee of safety Siberia cannot give. When New York sends a pugilist and gambler to represent her in Congress, like pain to the body, it is the signal that something is wrong, and the doctors are called in. There should exist no dark

spot in a republic unrepresented. Stifle the political voice of Five Points, and Fifth Avenue forgets its dangerous neighbor. Allow it utterance, and wealth unites with philanthropy to extinguish vicious conditions.

The faithless may deplore the broadening of suffrage, but it is futile to oppose it. To quote again from Lowell's address on Democracy: "For the question is no longer the academic one, is it wise to give every man the ballot, but the practical one, is it prudent to deprive whole classes of it any longer? It may be conjectured that it is cheaper in the long run to lift men up than to hold them down, and that the ballot in their hands is less dangerous to society than a sense of wrong in their heads."

The right to vote once grasped has never been voluntarily relinquished, and in spite of pessimism, with every extension of the franchise, society has rested more safely on its broadened base. So, however threatening appear the portents, and however the tempests roar, the ship of democracy, now too far upon its course to put back, must

"Right onward drive unharmed.
The port, well worth the cruise, is near
And every wave is charmed."

GOETHE AND SCHILLER'S XENIONS.

BY DR. PAUL CARUS.

It is well known what good friends Goethe and Schiller were. After the two great poets had become personally acquainted they inspired, criticised and corrected each other, their common ideal being the firm basis of their mutual friendship. The chief monument of their alliance are the *Xenions*, a collection of satirical epigrams which were published for the first time in the *Musen-Almanach* of 1797.

Goethe and Schiller had many enemies. On the one side the orthodox and narrow-minded *pietists* considered their poetry as irreligious and un-Christian; they accused them of paganism, while on the other side the shallow rationalist Nicolai, a man of some common sense but without any genius, railed at them as well as at Kant, Fichte and other great minds of his time who went beyond his depth so as to be incomprehensible to him.

Nicolai was a rich and influential publisher in Berlin; he was an author himself, and a very prolific one too, but all his writings are barren and shallow. On several occasions he had severely criticised Goethe, and our great poet-twins accused him that in fighting superstition he attacked poetry, and when he wanted to suppress the belief in *spirits* he tried to abolish spirit also. So Goethe makes him say in the *Walpurgisnacht*:

"Ich sag's Euch *Geistern* in's Gesicht,
Den *Geistes*-Despotismus leid ich nicht;
Mein Geist kann ihn nicht exerciren."
[I tell you, spirits, to your face,
I give to spirit-despotism no place;
My spirit cannot practice it at all.]

—Bayard Taylor's Translation.

"Willingly serve I my friends; but 'tis pity, I do it with pleasure.
And I am really vexed, That there's no virtue in me!"

And he answers in a second distich:

"There is no other advice than that you try to despise friends,
And, with disgust, you will do What such a duty demands."

David Hume's skepticism was in Schiller's time superceded by Kant's idealism. Hume, being in hades, hears Kantian philosophers talk. Their ideas are all confusion, he thinks, and only his own theory is consistent. So David Hume says to a neophyte:

"Do not speak to those folks, for Kant has confused all together.
Me you must ask; for I am, Even in hades, myself."

A crowd of many people generally behave very foolishly, although the single individuals who constitute the crowd may be quite sensible. This fact has been often observed, and one of the *Xenions* says:

"Every one of them, singly considered, is sensible, doubtless,
But, in a body, the whole Number of them is an ass."

Famous is the following distich:

"Science to one is the Goddess, majestic and lofty,—to th' other
She is a cow who supplies Butter and milk for his home."

Often quoted for their ethical value are these *Xenions*:

"Art thou afraid of death? thou wishest for being immortal!
Live as a part of the whole, When thou art gone, it remains." *

"Out of life there are two roads for every one open:
To the Ideal the one, th' other is leading to Death.
Try to escape in freedom as long as you live, on the former,
Ere on the latter you are Doomed to destruction and death."

"Truth which injures, is dearer to me than available errors.
Truth will cure all pain, Which is inflicted by truth."

"No one resemble the other, but each one resemble 'the
Highest!

How is that possible? Say! Perfect must ev'ry one be."
Grandeur is not a matter of vastness, but of loftiness;
not material but spiritual greatness makes sublime:

"Our astronomers say, their science is truly sublimest;
But sublimity, sirs, Never existeth in space."

The poet addresses his Muse:

How I could live without thee, I know not. But horror o'er-
takes me
Seeing these thousands and more Who without thee can exist."

We conclude with two distichs on religion. Goethe as well as Schiller were of true religious instinct, but both were averse to any sectarianism or dogmatical belief:

* Mr. E. C. Hegeler requests me to call the attention of the reader to the importance of this distich. It contains *in nuce* "the fundamental idea of Monism." The original German is:

Vor dem Tode erschrickst Du! Du wünschst unsterblich zu leben!
Leb im Ganzen! Wenn Du Lange dahin bist, es bleibt.

This "living immortal" by living in the whole as a part of the whole is the immortality of the soul Mr. Hegeler spoke of in his essay "The Basis of Ethics," and this idea is the salient point of the Monistic doctrine which the founder of THE OPEN COURT has made its standing programme.

"Which religion I have? There is none of all you may mention
Which I embrace; and the cause? Truly, religion it is!"

This religion is, as the poets express it in the above-quoted distich, to live as a part of the whole, as a part of humanity. The answer given in the last *Xenion*, we may well imagine, did not satisfy the narrow-minded orthodox. They cannot bring forward reasons, but they say: "Belief is a matter of conscience; if you do not believe, it is because you do not want to." Of such people the *Xenion* says:

"Well, I expected it so, for, if they have nothing to answer,
Then they immediately make Matter of conscience of it."

"CHRISTIAN SCIENCE."

BY S. V. CLEVENGER, M. D.

The brain being one of a number of associated organs, it is not remarkable that general health or sickness should affect the mind, nor that mental states should influence bodily conditions. Hippocrates knew that heart disease caused anxiety which was expressed in the face, and everyone knows that the liver difficulty called jaundice is attended with the "jaundiced disposition," and that the *spes phthisica*, a peculiar hopefulness, belongs to lung consumption.

Hope, fear, joy or grief influence the nutrition of the body; a fright may stop the digestion of a meal or cause death by arrest of the heart's action; joy has been known to kill, and excitement to impart great temporary strength. A very superficial examination of certain anatomical facts will aid the reader to understand this inter-dependence of mind and body, and intimate the direction in which the physiological psychologist works. It is no longer blasphemy to call the heart a pump, though that is precisely the charge Plempius from his pulpit made against Harvey for the assertion, nor is it flying in the face of Providence to speak of the arteries, capillaries and veins as tubes through which the blood is pumped by the heart; but when this half knowledge is built upon by the aid of the microscope, and the observer announces that the entire animal economy is a mechanism controlled by definite physical and chemical laws, and apparently nothing else, the olden denunciations are renewed.

Every portion of the body must have its food, and the blood current is merely elaborated, diluted, though concentrated, food, and the nerves and brain require more of this sustenance than other parts. Consciousness is lost the instant the brain is not supplied with blood, whether from heart failure or other cause. Surrounding the arteries are muscular bands that by contraction and expansion supplement the heart's action in propelling the blood onward. If there happen to be irregularity in the constriction or dilatation of these tubes, through the tightening or relaxation of the enveloping muscles, then circulatory aberrations occur, such as congestions, blushing, flushing, paleness, rapidity or slowness of pulse,

etc., producing convulsions, apoplexy, paralysis, neuralgias, faintings; and where these disturbances are limited to areas instead of being general, certain local effects follow, such as tumors and ulcers.

Toward the gray matter of the brain and spinal marrow proceed a multitude of sensory nerves, carrying inward impressions of touch, taste, heat, cold, smell, sight; telegraph lines that relate the individual to the outer world. From this same gray matter proceed motor nerves to all the muscles that move the arms, legs, trunk, head, or that surround the intestines, blood-vessels, the lung tubules and the glands. An impression that is unpleasant may pass over some of the sensory nerves and cause the motor nerves to provoke contractions of its muscles, which will be evidenced by a start, or spring backward, a flushed or pallid face, an outpour of perspiration from the sweat glands, that are, for the time being, paralyzed. In countless instances the control of the body by the nervous system, and in as many more, the dependence of the nervous system upon the healthy working of other organs, could be shown; but all these facts are obtainable by experience and a study of elementary physiology.

One of the most protean ailments is known as hysteria. The sufferer is usually a female and in most instances has inherited an unstable nervous system, which, through idleness, social dissipation and the yielding of relatives to every caprice, becomes confirmed. The erratic working of her circulation may, for awhile, shut off blood supply from the back part of the brain and afford hysterical blindness, partial or complete; if the speech center in front of the left ear be denuded, by spasm, of blood, then there is "aphonia" or hysterical speechlessness, or feebleness of voice; erratic blood supply also causes the "clavus" or hysterical headache; similar vasculating nutrition to other parts may set up the breathlessness, even the mucous rattling in the lungs, that simulates pneumonia, the rapid heart action, the writhings, contortions of hysterical convulsions or paralytic conditions and limb contractions.

Hysterical paralytics have been known to be bedridden for years and upon an alarm of fire spring nimbly from the house, or after months of successfully maintained cramped position of a leg suddenly straighten it under excitement, or when chloroformed. Minor cases usually complain of many indefinite things, but major or minor sufferers invariably react favorably to mental impressions if suitably afforded. For instance, an honest old physician frankly told the father of an hysterical girl that nothing but quackery would cure her. Resort was had to an "Indian doctor," who, with the impressiveness of his mysterious mumblings, long hair and emphatic assurances of omnipotence, actually induced her to arise from bed, restored to health. Years afterward some ruse the doctor used was injudiciously explained to her

and she at once returned to her bed and became demented. Discipline and education are far better methods than such deceit.

Many a scientific physician has suffered in his own esteem upon being credited with some such success, accidentally gained, and many a charlatan has exulted in the discovery of some such power over cases and marched to further conquests as a magnetic, magneto-electric, mesmeric, hypnotic, spiritualistic, faith-healer, or under some such designation.

Dishonesty and ignorance are not confined to any so-called school of medicine, and regularly educated physicians may be found who justify their resort to questionable means of securing fees.

It is not alone the hysterical who are susceptible to mental influence over diseases. Many a good old practitioner has been told "The very sight of you makes me better," by persons who could not be classed even as nervous. It is the unconscious operation of mentality that occurs every minute of our lives and is most noticeable when the pull at a dentist's door bell stops a toothache.

Members of the Chicago Medical Society can recall the time when an honest ignoramus detailed his wonderful power in several cases and asked for an explanation of its source. A better informed physician present suggested that a good-looking doctor was the secret of the recoveries in the cases described, and advised him to look up the literature of hysteria.

The history of medicine is full of successive epidemics of quackery, and undoubtedly during them many cases have been permanently benefited through emotional exercise, while more have been temporarily helped. The old superstition of the kings' ability to cure scrofula by his touch died out with the advance of knowledge, it becoming known that most of the applicants for this species of divine healing did not have the king's evil at all, and that the coin given to each case attracted malingeringers. Perkins by means of his "tractors," cylinders of metal held in the hands, "cured" multitudes throughout Europe. The Grotto of Lourdes, and a dance upon the tomb of Abelard and Heloise, has enabled many a cripple to throw away his crutches, but some way or other such rages die out and people need some new imposition.

One of the most prolific sources of revenue to every species of charlatanry, including faith-cure, is *mistaken diagnosis*. The cancer doctor removes false cancers and whenever ignorance pronounces upon the nature of its own disease, knavery is ready to relieve it of its troubles and its cash. In this recent puerility called "Christian Science" we may grant that not all its votaries are either knaves or fools, for undoubtedly people who are fairly well informed on most topics, and who are sincere in their belief, practice it, or are practiced upon by

it, often with success for the reasons mentioned, but such people are guiltless of physiological or pathological knowledge, know nothing of the fundamentals of scientific medicine and can be thus uninformed without deserving to be called rascals or generally ignorant.

There seems to be bitter internecine war among these Christian healers, for Mr. Teed, who claims to be the Messiah, does not disdain to touch the patient, while other "metaphysicians" do not find the contact necessary. Some contributor to Mr. Teed's journal pertinently asks how it is possible for faith healers to acquire all this wonderful power in twelve lessons regardless of their being atheists, illiterate, impure or the reverse.

"Christian Science" can effect cures in many hysterical cases, particularly headaches and some minor troubles that are not hysterical, but that can be reached through a mental impression; but of course belief is a *sine qua non*. That or any other species of medical nonsense can "cure" self limited diseases which will recover if left to themselves. The *post hoc ergo propter hoc* delusion is constantly held up to the student of medicine to warn him that he must not think a recovery to be a cure in every case, but the "metaphysician" is bothered by no such misgiving. Mumps will recover in a week; even typhoid fever and rheumatism in six weeks if not treated at all, possibly scarlatina or small-pox, but it is better to aid recovery by the exercise of a little medical common sense.

It would be safe to offer a reward of a million dollars for any "metaphysical" cure of a *genuine* cancer, a *real* migraine, an *actual* lung consumption or even a *positive* corn, not to mention the amputation of a leg or the reduction of a dislocation.

Occasionally we hear of actual failures of Christian Science and owing to the very materialistic views of the educated physician he is not surprised at such failures any more than at the inability of that "science" to faith-cure a leaky water pipe, without a plumber, or to faith-cure into solidity one of Budensick's wrecked houses, for when Bright's disease means that the kidneys are disintegrating, and dropsy follows from this or a badly disorganized heart, which does not pump blood to the kidneys, and when gangrene or decay of the body, usually the legs, follows from the little tubules or capillaries being plugged up or not conveying the needed nutrition to parts, the aforesaid physician cannot possibly conceive of faith, or mummery of any kind, restoring these tissues any more than it can build a house or pump out a sinking ship.

The following was clipped from the *Chicago Evening Mail*, and is very much to the point, while it accounts for the special mentions of dropsy and gangrene made above:

KANSAS CITY, MO., June 10.—The death of Mrs. Hannah Updike, from dropsy and gangrene, while in the hands and under the care of believers in the Christian science, or faith cure, is exciting no end of comment in this city. Mrs. Updike was the wife of a well known stockman of Topeka, and was brought here and placed under the care of the faith healers eight days ago, at her own request. She was suffering from dropsy and gangrene. The doctors had pronounced her case incurable. Before death gangrene had spread over an

entire limb. From the time she was given up to the care of the faith healers all medicines, even opiates, were stopped. She was constantly surrounded by a half-dozen or more believers, who in the midst of her terrible agonies urged her to believe and she would certainly be cured. At midnight, Mrs. Eunice Behan, one of the party, stood over her and declared that "disease must succumb to the fiat of the mind." At 12:45 Mrs. Updike was dead, and Mrs. Houston, the nurse of the healers, brushed back the hair from her cold forehead, and said, sadly, "She surrendered hope to fear."

A few hours before her death her agony was so great that her husband, against the protests of the others present, gave her an opiate. "We told him not to do it," said one of the attendants. "It was recognizing the power of fear over the mind. It also dulled the mind, and prevented it from rebelling with all its power against the results of latent fear, which we hold is made manifest on the body in different forms of disease."

"Did you know she was dying?" a reporter asked.

"The mind can rise above all emergencies," was the only response.

As an excuse for not summoning a physician to at least relieve the intense pain of her dying hours one of the healers said: "Mrs. Updike became a true believer in the cure of Christian science. We are censured for not calling in a physician, but had we done so it would have been a recognition of the fact that some material injury existed. This would have spoiled the Christian science cure."

In speaking of the case Dr. Ellston said: "I consider that criminal ignorance was displayed in the treatment of this case. The law, however, has no provision for punishing ignorance."

THE MODERN SKEPTIC.

BY JOHN BURROUGHS.

Part II.

The wise skeptic also sees that faith or superstition, rather than reason, must be the guide of the mass of mankind. What Strabo said nineteen centuries ago still holds true. "It is impossible," said the old Greek, "to conduct women and the gross multitude, and to render them holy, pious and upright by the precepts of reason and philosophy; superstition or the fear of the gods must be called in aid, the influence of which is founded on fiction or prodigies. For the thunder of Jupiter, the ægis of Minerva, the trident of Neptune, the torches and snakes of the Furies, the spears of the gods adorned with ivy, and the whole ancient theology are all fables which the legislators who formed the political constitution of States employ as bugbears to overawe the credulous and simple."

But from the point of view of the individual, of a serene, well-balanced, well-ordered life, reason is the best. "Prove all things, hold fast that which is good," is the voice of the cool, disinterested reason, directed to the individual. And when one sets out to prove all things, what guide can he have other than reason? This is "the light that lighteneth every man that cometh into the world," this and conscience; but in the region of speculative opinion and belief, conscience plays a very subordinate part. "Few minds in earnest," says Cardinal Newman, in his *Apologia*, "can remain at ease without some sort of rational grounds for their religious belief, to reconcile theory and fact is almost an instinct of the mind." It certainly is in our day, more so, probably, than ever before. No intelligent man can now conscientiously humble his reason before his faith, as good Sir Thomas Browne boasted he could. He said: "Men that live according to the right rule and law of reason, live but in their own kind, as brutes do in theirs." He said we are to believe, "not only above but contrary to reason and against the argument of our proper senses." A good many other people believed so too about that time. Poor Ann Arkens, young, intelligent and beautiful, was stretched upon the

rack, then burned with faggots and blown with gunpowder at Smithfield, all because she could not believe against the "argument of her proper senses" in transubstantiation, that the bread and wine the priest had mumbled over remained anything but bread and wine.

The skepticism of our day is mainly the result of science, of the enormous growth of our natural knowledge. In its light the old theology and cosmology look artificial and arbitrary; they do not fit into the scheme of creation as science discloses it. Our science is undoubtedly ignorant enough. We know no more about final causes, after science has done its best, than we did before, but familiarity with the laws and processes of the world does undoubtedly beget a habit of mind unfavorable to the personal and arbitrary view of things which the old theology has inculcated. Science has, at least, taught us that the universe is all of a piece or homogeneous; that man is a part of nature; that there are no breaks or faults in the scheme of creation, and can be none. One thing follows from another or is evolved from another, the whole system of things is vital, and not mechanical, and nothing is interpolated or arbitrarily thrust in from without. All our natural knowledge is based upon these principles. It is only in theology that we encounter notions that run counter to them, and that require our acceptance of doctrines in which our powers of reason and observation can have no part.

The man of science has no trouble in discovering God objectively—that is, as the all-embracing force and vitality that pervades and upholds the physical universe—in fact he can discover little else. Knock at any door he will, he finds the Eternal there to answer. But his search discloses no human attributes, nothing he can name in the terms he applies to man, nothing that suggests personality. He can no more ascribe personality to infinite power, than he can ascribe form to infinite space. Yet he knows infinite space must exist; it is a necessity of the mind, though it drives one crazy to try to conceive of it. It is a matter we apprehend, to use a distinction of Coleridge, but cannot comprehend. In the same way we know an infinite power, not ourselves, exists, but it passes the utmost stretch of comprehension. This I say, is disclosing God objectively, as a palpable, unavoidable fact. To disclose God subjectively through the conscience, or as an intimate revelation to the spirit, that is to experience religion, as usually understood. The person finds God by looking inward instead of outward, and finds him as a person. Some religious souls have a most intense and vivid conception of God subjectively, who cannot find him by an outward search at all. Cardinal Newman is such a man. He says the world seems simply to give the lie to that great truth of which his whole being is so full. "If I looked into a mirror and did not see my

face, I should have the sort of feeling which actually comes upon me when I look into this living, busy world and see no reflection of its Creator." What he calls this power, of which all visible things are the fruit and outcome, does not appear. Probably nature simply; but is nature something apart from God?

While this inward revelation of God to the spirit may be the most convincing of all proofs to the person experiencing it, yet it can have little force with another, little force as an argument, because, in the first place, it cannot be communicated or demonstrated. All independent objective truth is capable of being communicated and of being verified; but this fact of which Newman is so certain, he confesses himself, he cannot bring out with any logical force. It is its own proof. And in the second place, because the world knows how delusive these personal impressions and inward voices are. Men have heard an inward voice or felt an inward prompting that has led them to commit the most outrageous crimes against humanity, to burn witches and heretics, to mortify their own bodies, or to throw themselves from precipices. Good men and wise men have been equally sure, upon subjective evidence, of the existence of the devil; they have heard his promptings, his suggestions, and they have fought against him. Our fathers were just as sure, upon personal grounds, of the existence of the devil as Newman is of the existence of God. One may personify the whisperings, or the motives of evil within himself, and give it a bad name, and he may personify the nobler and higher voices within him and give it a good name. In either case it is a subjective phenomenon, which the man bent upon exact knowledge cannot attach much weight to. Satan walked and talked with the biblical writers, the same as did God; he even talked face to face with God himself. Not long since a respectable mechanic in one of the large cities believed himself bewitched; the hallucination worked upon him till he took to his bed, and finally he actually died, to all intents and purposes bewitched to death.

It is in the light of such facts and considerations as these that the so-called skeptic refuses to credit all people tell him about their knowledge of God. So that he is finally compelled to rest upon the God of force and law of outward nature.

It is also to be said that the decay of religious belief in our times is rather a decay of creeds and dogmas than of the spirit of true religion—religion as love, as an aspiration after the highest good. If we regard it as a decay of Christianity itself, it is to be remembered that Christianity bears no such intimate relation to modern life, either the life of the individual or to the life of the state, as polytheism bore to the life of the ancient world. It is rather of the nature of an aside in modern life, while in Greece and Rome and in Judea the natural

religion was the principal matter. The whole drama of history clustered around and was the illustration of this central fact. The state and the church were one. The national gods were invoked and deferred to on all occasions. Every festival was in honor of some divinity; the public games were presided over by some god. In going to war, or in concluding peace, solemn sacrifices were offered, and the favor of the gods was solicited.

"The religion of polytheism," says Gibbon, "was not merely a speculative doctrine professed in the schools or preached in the temples," on the contrary its deities and its rites "were closely interwoven with every circumstance of business or pleasure, of public or private life."

In comparison with many oriental people we are an irreligious and God-forsaken nation. No gods are recognized by the state, and in 1796 Washington signed a treaty with a Mohammedan country, in which it was declared that "the government of the United States is not in any sense founded on the Christian religion."

Hence, whatever we owe to Christianity, we cannot begin to owe to it what the ancient peoples owed to their religions. Great Britain still maintains the union of church and state, but it is a forced and artificial union; it is a *union* and not a *oneness*, a matter of law and not of life, as in ancient times. Yet ours is an age of faith, too, faith in science, in the essential soundness and goodness of the world. We are skeptical about the gods, but we are no longer skeptical about things, or about duty, or virtue, or manliness, or the need of well-ordered lives. The putting out of the candles on the altar has not put out the sun and stars too. We affirm more than we deny. We no longer deny the old religions, but accept them and see where they belong. Man is fast reaching the point where he does not need these kind of props and stays, the love of future good or the fear of future evil. There was a time when the pulling down of the temple pulled the sky down with it, all motives for right were extinguished, but that time is past. Righteousness has a scientific basis; the anger of heaven descends upon the ungodly in the shape of penalties for violated laws. A comet in the heavens is no longer a fearful portent, but sewer gas in your house is. Cholera is not a visitation for ungodliness, but for uncleanness, which is a form of ungodliness. We cannot pray with the old faith, but we can fight intemperance with more than the old zeal. We cannot love God as our fathers did, but we can love our neighbor much more. The spirit of charity and helpfulness has increased in the world as the old beliefs have declined. The skeptics and disbelievers could never slaughter each other as the Christians have. Science substitutes a rational basis for right conduct in place of the artificial basis of the church. The anger of the gods no longer threatens us; the displeasure of the church is no longer

a dread; but we know that virtue alone brings satisfaction. We cannot read the Bible with the old eyes, but we read nature with new eyes.

Probably religion has long ceased to play any important part in the great movements of the world. A religious war is no longer possible. In our two great wars and in the founding of this republic, religious belief was not concerned at all. The skeptics were just as ardent and just as brave and patriotic as the believers. The author of the Declaration of Independence was a skeptic. The policy of England, France, Germany, Russia, is it in any way inspired by the Christian religion? Never were so much courage and hope, and benevolence and virtue in the world as to-day, and never before were the ties of the old faiths so weak.

HINDU LEGEND.

BY GERTRUDE ALGER.

At Heaven's gate an Indian stood alone,
Whence could be seen, within, a golden throne
Awaiting him, 'mid glories nigh too great
For earthly eyes; when straightway to the gate
The gods came down and bade him "Enter in"
Where all was light and joy, untouched by sin.
The weary traveler heard the sweet request,
Unmoved, nor entered to his Heavenly rest;
But only said "This gate I cannot pass
Without my wife and brothers who, alas!—
Have fallen on the road, my good dog, too,
Is left behind, and not till it be true
All these I loved in life, with me may share
The Heavenly glories, will I enter there."
In vain the gods entreated him, for he
Was deaf to all, and scarcely seemed to see
The great celestial light about his throne,
And all the wonders meant for him alone.
'Twas not until the gods had given assent
To all he wished, that he would be content.

Excommunication seems to have no terrors for Dr. McGlynn. In a recent address to a large and enthusiastic audience in New York, he said:

But then they say they have excommunicated me. No; no man can do that. There are only two beings in all the vast universe that can separate me from God. One is that infinite, wise, good and merciful Being, our Heavenly Father. He could do it; but He never will until I consent first to separate myself from Him. * * * Then there is only one other being in all the universe, and that is Edward McGlynn. He can separate me from Him. * * * In such cases as mine their excommunications lose their terrors; their lightning, produced by a "super" from behind the scenes; their thunder a bit of sheet-iron shaken by a poor devil who gets fifty cents a night. An unjust excommunication is not worth the paper it is written on. It is with his own conscience one has to deal. * * * And if I am deprived of the sacraments of the church, I am theologian enough to know that I can save my soul without them.

The Open Court.

A FORTNIGHTLY JOURNAL.

Published every other Thursday at 169 to 175 La Salle Street (Nixor Building), corner Monroe Street, by

THE OPEN COURT PUBLISHING COMPANY

B. F. UNDERWOOD,
EDITOR AND MANAGER.

SARA A. UNDERWOOD,
ASSOCIATE EDITOR.

The leading object of THE OPEN COURT is to continue the work of *The Index*, that is, to establish religion on the basis of Science and in connection therewith it will present the Monistic philosophy. The founder of this journal believes this will furnish to others what it has to him, a religion which embraces all that is true and good in the religion that was taught in childhood to them and him.

Editorially, Monism and Agnosticism, so variously defined, will be treated not as antagonistic systems, but as positive and negative aspects of the one and only rational scientific philosophy, which, the editors hold, includes elements of truth common to all religions, without implying either the validity of theological assumption, or any limitations of possible knowledge, except such as the conditions of human thought impose.

THE OPEN COURT, while advocating morals and rational religious thought on the firm basis of Science, will aim to substitute for unquestioning credulity intelligent inquiry, for blind faith rational religious views, for unreasoning bigotry a liberal spirit, for sectarianism a broad and generous humanitarianism. With this end in view, this journal will submit all opinion to the crucial test of reason, encouraging the independent discussion by able thinkers of the great moral, religious, social and philosophical problems which are engaging the attention of thoughtful minds and upon the solution of which depend largely the highest interests of mankind.

While Contributors are expected to express freely their own views, the Editors are responsible only for editorial matter.

Terms of subscription three dollars per year in advance, postpaid to any part of the United States, and three dollars and fifty cents to foreign countries comprised in the postal union.

All communications intended for and all business letters relating to THE OPEN COURT should be addressed to B. F. Underwood, P. O. Drawer F, Chicago, Illinois, to whom should be made payable checks, postal orders and express orders.

THURSDAY, JULY 21, 1887.

THE FREE RELIGIOUS ASSOCIATION.

At the last annual meeting of the Free Religious Association, the Executive Committee at the suggestion of the President, were authorized and requested to "consider the conditions, wants, and prospects of Free Religion in America at the present time," to ascertain whether the reconstruction of the Association for more extended and effective efforts toward attaining its objects is desirable and possible, and to report their conclusions to the next annual meeting. In the convention the following morning the President sketched a plan which he thought, if it could be carried into effect, adapted to the end desired. The plan was briefly the division of the Association into "four working sections," each with its own organization, but the whole to be included in one general organization. He indicated the sections as follows:

1. SECTION OF SOCIOLOGY—For the thoughtful study of all problems pertaining to the social elevation of mankind, and for inciting and organizing practical measures to promote such progress.

2. SECTION OF RELIGIOUS AND ETHICAL PHILOSOPHY—Designed to bring together scattered thinkers and scholars on

these subjects, and to encourage original research therein, according to the scientific method.

3. SECTION OF NATURAL SCIENCE IN ITS RELATION TO RELIGION AND ETHICS—For intellectual workers occupying a distinct and wide domain, yet so closely allied to those of the second Section that the two at first, perhaps, might best be classed together.

4. SECTION OF THE RELATION OF RELIGION TO THE STATE—For resisting encroachments on liberty of conscience in religion, and for removing barriers to such liberty which may still exist in statute books, contrary to the fundamental theory of civil government in this country.

The Executive Committee desire to confer with liberal thinkers within or without the Association, as to the feasibility of this or some similar plan for enlarging and strengthening the work of the Association. Mr. W. J. Potter, the President, invites correspondence and suggestions on the subject. He may be reached through his post office address, New Bedford, Mass.

For twenty years the Free Religious Association has maintained a free platform, from which orthodox and heterodox Christians, Hebrews, Buddhists, monistic and dualistic thinkers, Materialists and Spiritualists, and anti-Christians merely, or those not advanced beyond the position of negation, have all had an opportunity to define and defend their views, and each in his own way. The papers and speeches have sometimes been of a high order and the discussions usually intelligent and conducted with courtesy and in good taste.

The Association was formed in the interests of religious enlightenment, freedom and progress. It had its origin in a departure from Unitarianism, and it has been chiefly under the management of those who had found even in that, the most liberal of the Christian denominations, limitations which they thought inconsistent with entire freedom of thought. In drafting the statement of their aims and objects, the founders of the Association used language such as in the church they had been accustomed to employ to define their position in distinction to the Unitarian creed.

Mr. Frothingham, in his article in the July number of the *North American Review*, says that the objects of the Free Religious Association, as its constitution declared at the beginning, were "to encourage the scientific study of religion and ethics, to advocate freedom in religion, to increase fellowship in spirit, and to emphasize the supremacy of practical morality in all the relations of life." Mr. Frothingham is mistaken. A constitution with the objects of the organization so stated could not have been adopted twenty years ago. Its leader and members had not become sufficiently emancipated from theological beliefs or theological phraseology. The first article of the constitution, as originally adopted, was as follows:

This Association shall be called the Free Religious Association—its objects being to promote the interests of pure religion,

to encourage the scientific study of theology, and to increase fellowship in the spirit; and to this end all persons interested in these objects are cordially invited to its membership.

The amended article, from which the quotation is made in the *North American Review*, adopted after a year's consideration, and not without some opposition, as late as 1887, marks the evolution of thought inside the organization from its formation to that date.

The Free Religious Association has done a good work; and if some such plan as that submitted by Mr. Potter can be agreed upon and carried out, we have no doubt that the usefulness of the organization will continue and be greatly increased.

THE ROCK AHEAD IN WOMAN SUFFRAGE.

Some years before ever the Woman's Christian Temperance Union had, under the intrepid and wide-awake leadership of Frances Willard, become awakened to the fact that the ballot would be the most effective weapon in its warfare against intemperance; before the great mass of its members had—lulling their religious scruples to rest with new readings of St. Paul—turned their faces doubtfully in the direction of progress, or set their feet in the path already trodden into comparative smoothness by the heterodox pioneers of suffrage, a professedly ardent lover of liberty surprised the writer by what seemed to her an attack on the true principles of liberty in his earnest opposition to any immediate action with view to obtaining the franchise for women, and by his stirring appeal to her as a freethinker to cease effort and agitation in that direction. "You know as well as I do," he said, "that women as a class are, by reason of their previous condition and limitations, far in the rear of men in their views of intellectual liberty. Women are to-day the chief pillars of the churches, and are a thousand times more subservient to the wishes and will of the clergy than men. We who understand what a barrier to liberty of conscience and expression the orthodox churches must remain, ought to work first of all for the upbuilding on solid foundations of the principles of true liberty for humanity. If we do not secure this legally before women are given the ballot, or have outgrown the influence of creeds, we shall be thrown back at least a century in our work; for, if women could vote to-day, their first efforts in the direction of influencing legislation would be, under leadership of their revered teachers, the clergy, to mix religion with politics, to put the name of God into the Constitution as a shibboleth, to lay traps in law to fetter free expression of opinion and force upon us new theological shackles to take the place of those we have by long effort succeeded in breaking, or which have become worn out by time, and so perhaps plunge the nation into intolerance and consequent disaster. I understand your feelings as a woman who longs to see her sex relieved of the bonds which it has become used

to. I understand and sympathize with that love of liberty which rebels at the thought of refusing to aid in whatever direction liberty calls; but reason is greater and more imperative than even liberty, and reason bids you work for the larger liberty of conscience at the risk of seeming to ignore temporarily the rights of your sex."

We did not then and do not now acknowledge the justice of this plea, though we have since, as we had before, heard it from many other sources. Macaulay says that the best way to prepare a people for freedom is to give them freedom. And the best way to prepare women to recognize and respect the rights of others is first to recognize, and permit them to exercise, their rights. The temporary evil resulting from any narrowness on their part—due largely to their non-participation in what vitally concerns them, and the restriction of their thought to merely domestic matters—will be more than compensated by the larger views and broader sympathies and more liberal spirit which will come to them. But the evil feared by our pessimistic prophet is nevertheless a possible one among these temporary evils, and unless guarded against in time, may prove a very serious one. Already, even before the end in view is attained, we find evidence here and there of the underlying spirit of religious intolerance among women workers for suffrage, which is sufficient to fill the hearts of the true friends of the movement with alarm and dismay, and it is to warn against the encouragement of the encroachments of this insidious foe to progress that this editorial is written.

Already women workers for suffrage of known heterodox views, however careful "not to offend one of these little ones" by parade of, or reference to, their own religious opinions, and however sensitively regardful of the differing opinions of their co-laborers by thoughtful avoidance of subjects foreign to that of woman's enfranchisement, are beginning to find their rights of opinion attacked by leaders in the orthodox flank of the suffrage army. Many of these incidents, of course, never reach the public, but one or two instances which have we wish here to refer to as indication of a spirit sure to bring disaster to the woman's cause if allowed to grow. Members of the Woman's Christian Temperance Union seem thus far to take the lead in this aggressive Phariseism. We quote from a correspondent of the Boston *Woman's Journal* of a recent date:

At the County Convention of the W. C. T. U., just held in Rock Island, Ill., the hour devoted to equal suffrage was occupied by Mrs. Clara Neymann, of New York, whose services were secured by the Equal Suffrage Society of Moline for the occasion.

Mrs. Louise S. Rounds, State President of the Illinois W. C. T. U., spoke of the paper presented by Mrs. Neymann. She said she had heard names quoted—Emerson, John Stuart Mill, and Herbert Spencer—eminent names that would live for years, perhaps, but not one word of Jesus, to whom alone this reform could look for permanent support. She was first of all a Christian, then a temperance woman, and, last of all—having come to the

position "gingerly," as her hearers would witness—a believer in suffrage for women on temperance grounds. She was tired of hearing the old, threadbare cry, the long-harped-on tune, of "woman's rights," preached by the goddess women who had been leaders in the cause. She spoke with much vehemence, and struck the pew with her hand to enforce her remarks.

Several ladies present mildly deprecated the president's remarks, and

Mrs. Neymann asked if a criticism was just which was based solely on negations. As she understood Mrs. Rounds, she was criticised for what she had failed to say, not for what she had said.

It would, it seems to us, be more politic for the purpose such Christians have in view to wait until some indiscriminate and enthusiastic freethinker assails, in the suffrage meetings, the Christianity of some suffragist. It is always safest, in view of gaining adherents to one's opinions, to remain upon the defensive. It is cowardly and unjust to attack unprovoked; it is pusillanimous to refuse to defend one's self from such attack, whether it be personal violence or an assault upon our convictions. Certainly no greater wrong could be done than thus to assail one so careful to avoid giving cause of offense to those who differ from her theologically as the gentlemanly and loving-hearted Mrs. Neymann, who, while still smarting under this uncalled-for attack, relating to us the particulars, showed not one trace of ill-will toward her opponent, but only grief tempered by surprise that she should have been the object of it.

One more straw indicative of how strongly the current on which the suffrage movement is floating is tending toward the treacherous rock of intolerance we find in the following clipping from the *Chicago Inter-Ocean* of May 18:

Mrs. Elizabeth Boynton Harbert presided over a meeting of the Cook County Women's Suffrage Association, held at the Sherman yesterday afternoon. After transacting some business prior to their adjournment for the summer, a few remarks were made by Mrs. M. E. Holmes, Galva, Ill., President of the State Suffrage Association, in which she alluded to the encouraging progress being made in the State. She then closed by saying that the one thing necessary was to consider the relation of suffrage to the church; that suffragists stand out from church work too much. She claimed that they cannot do the work until they, as suffragists, get into the churches; that a strict spiritual as well as a suffrage society is necessary. She said this is the only way to get the church people in the work. A strong feeling is prevalent, that suffrage has nothing to do with religion, and, if that be the case, she wanted nothing to do with suffrage. Mrs. Underwood, assistant editor of THE OPEN COURT, and who recently came to this city from Boston, asked if the constitution of this association touched on the subject of religious creed or dogma. The question was asked, she said, simply for information, as in Massachusetts the suffrage movement was one solely and distinctly separate from religion and prohibition, and she felt it should so continue, as there are many of its leaders like Mrs. Stanton and others, who perhaps hold to no particular religious creed or church, and would, on these grounds, be barred out of the movement if it rested on creed or church dogmas. Several ladies thought this an attack on their individual church, and all came forward to air themselves on their personal church and religious tenets. Mrs. Harbert soon took in the situation and

stopped debate. Mrs. Underwood in a few words made herself plain and poured oil on the troubled waters.

To some it may seem almost impertinent on the part of members of an association which comes so laggardly into the field of suffrage work, to say to those who have made the work possible to them that they do not choose to work with them, and that their best policy is to give way gracefully to the newcomers, who feel quite competent to accept any stray laurels of success which may now be won, and to denounce as unworthy of recognition such leaders in the movement as Mary Wolstonecraft, John Stuart Mill, Mrs. Elizabeth Cady Stanton, Frances Wright, Ernestine L. Rose, Judge Hurlbut, Lucretia Mott, Lydia Maria Child, Parker Pillsbury, Frances D. Gage, and hundreds of others whose names will readily occur to mind.

Women of the Christian Temperance Union, beware of this rock of intolerance! Read history and ponder its lessons; learn to think it possible that your wisdom may not comprise *all* the wisdom of this world, and remember that the heretics of yesterday are the revered teachers of to-day.

S. A. U.

A prominent Mexican liberal writes that the church in Mexico is fast declining in influence. "The men," he says, "are generally unbelievers, although they are counted as church members because they do not take the trouble to explain their position. The strength of the church is with the women and the ignorant. Attend the services, and what do you see? Many men? No; nine out of ten worshipers are women. The fact is, there has been a very rapid spread of unbelief among the intelligent men of Mexico. The school of Kant has many disciples. Speculative philosophy has taken root among our students. Those representatives of the church who let politics alone and consider only the spiritual aspect of the situation are greatly alarmed at this growth of liberalism in religion. At the rate we are going we shall be a nation of believers in the greatest freedom of religious thought."

* * *

The following short sketch of Richard A. Proctor is copied from the *Chicago Tribune*:

The eminent English astronomer, Richard Anthony Proctor, has decided to become an American citizen, and is building a residence at Orange Lake, Florida, the great orange grove section of that State. The learned man's wife is an American, and it is fair to presume that she is entitled to more credit than the sunny groves of Florida for her husband's intention to make his home in the United States.

Mr. Proctor was born in England, in the year 1837, in good social position, and received a thorough education. After preparatory studies in several private schools, he proceeded to King's College, London, and from thence to St. John's College, Cambridge, where he was graduated in 1860, with honors. In 1866 he was appointed a Fellow of the Royal Astronomical Society of England; and an honorary Fellow of King's College, London, in 1873. He edited the proceedings of the Royal Astronomical

Society in 1872-73. In 1869 he created great interest by maintaining against the almost universal opinion of astronomers, the theory of the solar corona and also that of the inner complex solar atmosphere, this the discovery of Professor Young, both of which have since been accepted. Mr. Proctor has lectured in all the principal cities of England, Canada, the United States, New South Wales, Victoria, South Australia, New Zealand and other countries. He knows how to make astronomy interesting, a gift rare as well as most desirable.

Mr. Proctor has written much on scientific subjects in various publications, and is the author of more than sixty books. *Knowledge*, an English periodical edited by him and which has a large circulation in scientific circles, will be issued as an American publication. The articles on astronomy in *Appleton's Encyclopedia* and the *Encyclopædia Britannica* were written by Mr. Proctor, who constructed a chart of the heavens, and in 1874, added greatly to his reputation by his learned researches into the transits of Venus. This great astronomer is a man of strong domestic tastes. He lost his first wife in January, 1879. The present Mrs. Proctor, who is a niece of General Jefferson Thompson, of Virginia, became so in May, 1881. Her husband had made a tour of the United States previously to the time of his marriage to this American lady, in 1873-74, 1875, and just before that happy event. The accession of Richard A. Proctor to the ranks of naturalized Americans will be a decided gain to the cause of learning, scientific inquiry and popular instruction.

* * *

Referring to the recent Andover decision, the *Unitarian Review*, now ably conducted by Joseph Henry Allen, of Cambridge, Mass., pertinently observes:

The press as a whole, continues to side very vigorously with the accused; but the press, as well as the trustees in their recent manifesto, confuse two radically diverse questions. The one is a question of sympathy with the comparatively liberal and humane spirit displayed at Andover. * * * But the second question is the plain ethical question of the right of these estimable gentlemen to teach what they do teach in the place they hold under the local conditions of their foundations. On this point, which is really the main question of the two, we hold that the Visitors have acted justly, and that a high standard of honor should have led the professors to resign their places before this. They are honorable men, but the confusion of mind which keeps them where they are is to be regretted in the interests of morality and theology alike. If taken up to the law courts the Andover case will serve to advertise the dissensions of the Trinitarian Congregationalists, and the liberal cause will profit thereby; but we shall esteem it a misfortune should the courts set aside the decision of the Visitors. The thing most needed now by our Trinitarian brethren is a new and free Andover, unshackled by a creed and the necessity of maintaining legal obligations which are not those of reason and of truth.

* * *

Dr. McGlynn's speech contains a very significant passage, which the *Tribune* and the *Sun*, not less significantly, have suppressed. We quote from the *verbatim* report of the *Times*:

They calumniate me when they say I took the stump for Mr. Cleveland. It is a lie. They tried to make a religious feeling against Mr. Cleveland because he vetoed an appropriation of \$25,000 for a Catholic Protectory. I should have done the very same thing in his place.

This is the first revelation "from the inside" of the reason why "they tried to make a religious feeling against Mr. Cleveland." Everybody knows of the effort, and that it was strong enough, in the secrecy which enveloped it, very nearly to defeat Mr. Cleveland. Many people also knew well enough the reason for it, but could not prove it. Now it is officially revealed by a

man who knows perfectly what was going on in the councils of Mr. Cleveland's opponents in 1884. The revelation is one of the greatest pieces of Mr. Cleveland's proverbial luck. A secret diversion of the Roman Catholic vote from a Democratic candidate is a serious misfortune, but open, announced opposition on religious grounds is another matter. No better piece of luck could befall a candidate than to have it known that he was to be "jumped on" by some of our foreign citizens "because he vetoed an appropriation of \$25,000 for a Catholic Protectory." Such an announcement would insure his election. Our people will not stand religion in politics; least of all will they stand the Pope in politics.—*The Nation*.

* * *

Rev. Dr. Burgon, Dean of Chichester, in replying to Canon Freemantle in the April number of the *Fortnightly Review*, declares that the doctrine of evolution is false and "the veriest foolishness," and in support of this opinion he says that "man is never found at all in a fossil state." The editor of the *Popular Science Monthly*, after remarking that, had Dr. Burgon "opened the most elementary contemporary treatise on geology, he would have found that abundant fossil remains of man, and abundant traces also of his works, have been found in association with the bones of now extinct animals," and after pointing out some of the other errors of the learned dean, adds: "Dr. Burgon's article will do good. The extreme ignorance he manifests on scientific questions, and the unbounded confidence with which he nevertheless undertakes to discuss them, will open the eyes of many as to the pressing need for the scientific education of the clergy."

* * *

The Protestant clergy of Montreal have made vigorous efforts to suppress all means of amusement and diversion on Sunday, but the City Council has resisted these attempts to curtail the few privileges the people now enjoy, and a most important advance has been made by the opening of the Fraser Institute—the free public library—on Sunday. This is owing to the generous and wise action of Mr. John H. R. Molson, the wealthy brewer, who has donated \$10,000 to the Fraser Institute, upon the condition that it shall be opened to the public on Sundays at the same hours as upon other days. The trustees have accepted the gift and the conditions. Mr. Molson is a vice-president of the Montreal Pioneer Freethought Club, which was the first institution in Montreal to open its reading rooms and library free to the public.—*Secular Thought*.

* * *

Mr. O. B. Frothingham has an article in the *North American Review* for July on "Why Am I a Free Religionist?" In connection with his reasons for belonging to the Association, he gives some account of its origin, early history and possible future. The treatment of the subject is not so full as we could wish, but there is enough in the article to make it of interest, especially to members of the Association.

* * *

The concluding part of Professor Cope's great essay, proof of which has not been returned in time for this issue, will be inserted in No. 13.

TWO PROPHETS.

BY ALFRED H. PETERS.

The greatest human possession is the power of compelling thought. He is the most godlike man who forces the world, or any considerable portion of it, to accept his words as truth. Chief among such are the establishers of great ideas hitherto untried or unheard of. These become founders of religions and of systems of ethics and of physics, spiritual and mental sovereigns of whose title there is never any dispute. Second only to such are those interpreters and confirmers of ideas, more or less accepted, who possess unusual insight or expression. These, if not sovereigns, are, by virtue of their being stimulators to spiritual and mental activity, the prophets and ministers of the race. Of the first class there appears but one in a thousand years. Of the second, every generation produces one or more; leaders and shapers of their age, not sure of the first place, but sure of the affection and reverence of mankind for a portion of, if not for all time. Of this class Franklin was the most conspicuous individual produced by us previous to the present century. No one of our countrymen, before or during his time, influenced general thought throughout the world as did he. He was, pre-eminently, the wise man, the oracle of the new republic. Of the same class in this century two men, thus far, overtop all others as thought-compellers of their own time in the United States—Emerson, the fortifier of humanity, and Beecher, its apologist. No Americans, save Franklin, have in a general way so influenced human opinion as have these two.

Sprung from the same stock; educated for the same profession; idealists both; no teachers ever bore to their fellows more different messages, or in a more different way. Alike optimists and humanitarians, their theories of the conduct of life were entirely opposite. Radical dissenters from the old order of things, the dissent of one was not the dissent of the other. Courage, tolerance, and a hatred of cant they indeed possessed in common, as they did that quality of intellect which cannot be specialized, whose work applies to all time, and to one part of the world as much as to another, the surest test everywhere of human greatness.

As the advocate of reason against passion, as the maintainer of the possibilities of the human will and the declarer that virtue is its own reward, Emerson is the later apostle of all those who make the higher life dependent upon themselves. He came not crying repent, so much as overcome. Repentance is good, but not to require repentance is better. Denial of self for others is good, but to make it unnecessary that others should deny themselves for you is as noble as it is to deny yourself for them. Charity is good, but why make occasion for charity? To profit at another's expense, whether by his good will or by your dishonesty, is a confession of

inferiority. Human inequality is a natural law; what one possesses another lacks. Cease then, to envy what is another's and make the most of what is your own. Think not to avoid conflict, which is an inexorable condition of existence, but let the conflict be with yourself.

A democrat and an individualist he nevertheless was by temperament exclusive, as all very fine natures are however they may strive to be otherwise. To him the same law regulated the intermingling of men that regulates the mingling of oil and water—like seeks like and appeals to like everywhere. With the greedy, cozening, time-serving, passion-yielding crowd he had as little sympathy as they had with him. No man ever became his disciple whose best energies were exercised upon material things. With all fault-finders, blamers of others, and wearers of their hearts upon their sleeves he had as little patience as he had with other mendicants. But wherever he saw man or woman, of whatever estate, walking alone, "consuming their own smoke," doing their own thinking and making daily trial of their own strength, there he recognized one in earnest, and a true yoke-fellow with himself.

He is the best representative of the stoic school of philosophy which the nineteenth century can show. Not of that order which held pain to be no evil, or withstood destiny by despising everything of which it could deprive them, but one of those fate-abiding, passion-tempered spirits, "gentle and just and dreadful," of whom the best types are Seneca and Marcus Antoninus. Like them he believed that "no man can ever be poor who goes to himself for what he wants." He held the most desirable things to be, not commodity and supremacy, things dependant upon others, but appreciation and perception, things dependant upon one's self. He taught that loss is a necessity to which we should build altars, and that nothing so disenthalls us from the disturbing confusion of life as the habit of thought.

Of course it is to the intellectual class that he mainly appeals. By this, however, is not meant those merely who are engaged in bookish pursuits, but that great, serious, and for the most part, silent company of men and women in whom there exists a perpetual hunger of the mind. He has been an inspiration to meditative spirits and perceivers of beauty the world over. Especially helpful is he to those who are just having their early ideals of the world undeceived. The most critical period in the life of every right dispositioned young man or woman is when they first realize that people regard having as more important than being. Such an one, when sore at finding "his graces have served him but as enemies," is unspeakably strengthened and comforted by the lofty teaching that if a scrupulous sense of honor does not pay, materially speaking, yet he who refuses to barter his convictions possesses what is worth more than all

rewards of policy—the knowledge that the world could not overcome him.

When the history of American thought is finally written, one of the epochs in it will be marked by the New England Transcendental Movement. This was the first permanent effort in the republic, on the part of any considerable number, toward an inquiry into the conduct of life which did not assert for itself the authority of supernatural revelation. Unlike the movement of Channing, it cut entirely loose from Christianity and appealed from the doctrine of human weakness to the doctrine of human strength. It was the first re-affirmation of the philosophy of Zeno by any recognized body of thinkers which had been heard for fifteen centuries. No matter if many enthusiastic people brought ridicule upon the movement by giving its name to their own schemes for making the world over in a day. Extravagance of intellect is no more to be wondered at than extravagance of emotion. It was one of those periods in society which the historian Grote declares especially valuable to study, because routine is broken through and the constructive faculties called into exercise.

The first effect of this movement was a decline of reverence for all authority whatsoever whose claim to directorship was founded on other than present excellence. Its next effect was to make religious independence respectable. Its latest effect, which was set back twenty years by the war for the Union, was to make respectable independence in politics. The same region is at the present time giving most uneasiness to the beneficiaries of politics which has for the last thirty years given most uneasiness to the beneficiaries of religion.

Of this movement Emerson was the acknowledged head. Unlike certain others he did not abandon the transcendental principle because of its failure to work an immediate reformation. Withdrawing from the world he consecrated himself to contemplation, like a mediæval mystic. All of transcendentalism that was founded upon individual effort drew from him its main inspiration. His influence is seen in all later subjective literature. Whether he was poet or philosopher, or both, men may continue to differ, but there is no difference as to the position he will occupy among the compellers of thought.

Instead of the doctrine that happiness depends mainly upon one's self, the mass of men have ever preferred to think that it depends upon the aid of their fellows or of supernatural powers. They would fain believe that the law of cause and effect may in some way be made void, and from time to time, therefore, it is proclaimed that punishment for the sins of one's ancestors is a crime, and for one's own a mistake. But for the tremendous conviction that every transgression carries with it a penalty, this doctrine would long ago have

superseded the one upon which all civil and religious government has been thus far based. Charity, sympathy and generosity are more winning virtues than justice, temperance and patience. The world loves the one; it does not love the other. Its submission to them is the homage which weakness pays to strength.

To the multitude of those who were ready to break from Puritanism, the transcendental philosophy was no more attractive than the old theology. Its creed was equally austere; its practice no less disciplinary. It was, in fact, a kind of Calvinism whose deity was a natural instead of a revealed one, and wherein election depended principally upon one's self. Its subjection of the emotions to the intellect, and the little charity exercised by some of its apostles toward human weakness made its rejection by the mass of people an assurance from the start. It was a life with more love in it for which they asked, something realistic and not an abstraction. So true it is that "the blood which first passes through the brain is never so red as that which flows direct from the heart." Another dispensation was demanded, and presently its prophet appeared.
